BY JAMES G. PERCIVAL.

EMBELLISHED WITH

A COMPLETE ATLAS,

AND

A SERIES OF BEAUTIFUL ENGRAVINGS.

IN THREE VOLUMES.

VOL. II.

BOSTON:
PRINTED AND PUBLISHED BY SAMUEL WALKER.

1847.

DISTRICT OF MASSACHUSETTS, *to wit* :

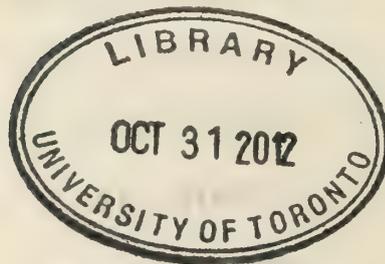

District Clerk's office.

BE IT REMEMBERED, that on the third day of January, A. D. 1828, in the fifty-second year of the Independence of the United States of America, Samuel Walker of the said District, has deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, *to wit* :—

System of Geography. By M. MALTE-BRUN, editor of the "Annales Des Voyages," &c. With additions and corrections, by JAMES G. PERCIVAL. Embellished with a complete atlas, and a series of beautiful engravings. Vol. I. Stereotyped by James Conner, New-York.

In conformity to the Act of the Congress of the United States, entitled, "An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned;" and also to an Act, entitled, "An Act supplementary to an Act, entitled, An Act for the encouragement of learning, by securing the copies of maps, charts, and books, to the authors and proprietors of such copies during the times therein mentioned; and extending the benefits thereof to the arts of designing, engraving, and etching historical and oth. prints."

JNO. W. DAVIS. } *Clerk of the District
of Massachusetts.*

ADVERTISEMENT.

WHEN we undertook to prepare this edition, we only engaged to make such additions, and corrections in point of fact, as would adapt it to the present state of science, and particularly to this country. We have since found it necessary, from the imperfect state of the translation, to revise it throughout on the original, and we flatter ourselves that many errors will be thereby avoided. This edition, then, will differ from others by the addition of notes, and by the correction of all errors in translation, and in point of fact, which have caught our notice. We have endeavoured to give the whole work a careful revision, and, although we do not pretend to have rendered it perfect, yet we trust it will not be found seriously defective. We need not say any thing as to the value of the work. It has been already sufficiently established in the good opinion of the public. We have had to perform, in this edition, a very humble, although a laborious office, and if we have rendered the work more complete, in any respect, we shall feel that we have not altogether failed in what we have undertaken.

J. G. P.

CONTENTS OF VOL. II.

☞ **TO THE READER.**—When the present work was put to press, the whole was expected to be comprised in two volumes. But owing to the London copy making nine instead of seven volumes, and thereby increasing the number of pages for the second volume to more than double the number of pages given in the first volume, it has been deemed expedient to divide the second volume, and commence the third volume with page 681. An extra title page is given, and the Contents and Index are so arranged as to cause no inconvenience to the reader.

BOOK LIX.

AFRICA.

A General View of this Division of the World, and its Inhabitants.

Africa little Known,	3
Seas and Gulfs,	3
Promontories—Straits—Isthmus—Rivers—Configuration of the Mountains,	3
Mountain Chains—On the Existence of a Central Chain,	4
Reasons against its Existence,	4
Why has Africa few Islands?	5
Plains and Table-Lands—Rivers without Outlets—Periodical Swellings of the Rivers,	5
Climate—Temperature,	5
Contrasts of Fertility and Sterility,	5
General View of its Vegetation,	6
Animals—Peculiar Animal Forms,	6
Man—Three African Races,	6
Languages of Africa—Progress of Civilization—Primitive State,	7
Fetichism,	7
Theocracies of Meroë, Thebes, &c.—Internal Revolutions of Egypt—The Carthaginians,	7
The Romans—Christianity—The Arabs and Mahometanism,	8
The Turks—Modern State,	8

BOOK LX.

EGYPT.

PART I.

A Physical Description of this Country.

The Nile, its Sources and Course,	9
Communication of the Nile and Niger—Cataracts of the Nile,	9
Valley of the Nile—Parallel Line of Mountains,	9
Level—Basin of Faïoom—Plains of the Delta,	9
Mouths,	10
Depth and Rapidity—Navigation—Inundations of the Nile,	10

Mud of the Nile,	11
Qualities of the Nile water—Nature of the Rocks—Specimens of Obelisks,	11
Mountains of Cosseir,	11
Mountains of Suez—Saline Depositions—Mountains of Upper Egypt—Valley of the Natron Lakes,	12
Valley of the Dry River—Changes of the Soil,	12
Lake Mœris—Maritime Lakes,	12
Lake Menzaleh,	13
Canals,	13
Climate—Varied Aspect—Causes of the Scarcity of Rain,	13
Temperature—The Mirage,	14
Progress of the Winds—North Winds,	14
The South Winds, or Khamseen—Endemic Diseases—Ophthalmia,	14
Vegetables—Crops of the Inundated Lands—Corn Crops,	14
Culture of Dry Lands,	15
Artificial Irrigations,	15
Fruit Trees—Vines,	15
The Persea—The Lotus, different meanings of this term,	15, 16
Forest Trees—Table of the succession of Cultures through the year,	16
Animals—Crocodile—Hippopotamus,	16
Fish—Birds,	17

BOOK LXI.

EGYPT.

PART II.

Inquiries relative to the Isthmus of Suez, and the extremity of the Arabian Gulf.

Questions proposed,	18
Level and Inclinations of the Surface,	18
Consequences of its Level—Hypothesis on the waters of the Mediterranean,	18
Position of Herœopolis—Herœopolis is not Pithom,	19
Herœopolis is identical with Hero—Distances assigned in the Itineraries,	19
Objections,	19
Mythological Traditions—Conclusions,	19, 20
The Herœopolis of Ptolemy—Position of Arsinoe,	20

Position of Clysmā,	20
Cause of Ptolemy's error—Conclusion,	20
Ancient Measures of the breadth of the Isthmus—Examination of a passage in Moses,	20, 21
Heröopolis is not identical with Baal-Zephon—Canal of the two Seas,	21
Antiquity of this Work,	21, 22

BOOK LXII.

EGYPT.

PART III.

Topographical and Political Details.

Historical Revolutions,	23
Mamelukes—French,	23
Ancient and Modern Divisions,	23
Towns of Lower Egypt—Alexandria—Harbours,	24
The Ancient City—Column called Pompey's Pillar,	24
Rosetta,	24
Northern Coasts—Damiëta,	24, 25
Towns of the Eastern Delta—Point of the ancient Delta,	25
Interior of the Delta—Places of Pilgrimage,	25
Towns on the West of the Delta—Grand Cairo,	25
Origin of Cairo—Manners and Amusements,	25, 26
Town of Djizeh, and the Great Pyramids,	26
Belzoni's Operations on the Second Pyramid,	26, 27

Objections to this Hypothesis,	52
Passage in Maximus Tyrius—Description of the Region of Mount Atlas,	52, 53

Vegetation—Vegetation of the Coasts and the Table Lands, 53
 The Forests—Flowers, 53
 Alimentary Plants—Animal Kingdom—Camel of the Desert, 53
 Degrees of Swiftmess—Other Domestic Animals, 53, 54
 Wild Animals—Discussion on the Bears of Africa, 54
 Ostrich Hunting—Inhabitants—The Moors, 54
 Moorish Fanaticism, 55
 The Arabs, 55
 The Berbers, 55
 The Marabouts, 55
 Description of a Plague, 56

BOOK LXV.

THE BARBARY STATES, AND THE GREAT DESERT OR ZAHARA.

PART II.

Detailed Descriptions.

The Desert or Kingdom of Barca, 57
 Ruins of Cyrene, 57
 Oâsis of Siwah, 57
 The Oâsis of Audjelah—The Desert of Haroodjeh—Fabulous Town—Fezzan, 57, 58
 Climate—Soil and Productions, 58
 Government—Inhabitants—Tibbos, 58, 59
 TRIPOLI—Climate and Productions—Towns—Antiquity of Tripoli, 59
 Different Towns—Government—Navy, 59
 KINGDOM OF TUNIS—Government, 59
 Climate—Productions—City of Tunis, 60
 Ruins of Carthage—State of Gadames, 60
 STATE OF ALGIERS—Soil and Productions, 60
 Boundaries—Divisions—City of Algiers—Towns of the Province of Mascara, 60
 Of Constantina, 61
 Inhabitants, 61
 EMPIRE OF MOROCCO, 61
 The Almoravides, 61, 62
 Boundaries—Productions—Rivers, 62
 Towns of the Kingdom of Fez, 62
 Towns of the Kingdom of Morocco—Towns to the South of the Atlas—Population of Morocco, 62, 63
 Government—Administration—Civil Condition, 63
 Religions—Situation of the Jews, 63
 Pride of the Moors—Singular Points of Etiquette, 64
 Revenues—Export Trade—Imports, 64
 Biledulgerid—ZAHARA, 64
 Soil and Minerals—Climate—Vegetation—Animals, 64
 The Coast—Tribes to the North of Cape Blanco, 65
 Fate of Captives—Tribes to the South of Cape Blanco—The Trarsas, 65
 Manners of the Moors, 65, 66
 The Caravan of Morocco—Dangers Encountered, 66
 Route of this Caravan, 66
 Mode of Living of the Travellers—Deserts and Oâses of the Centre, 66
 Origin of the Desert, 66, 67

BOOK LXVI.

SENEGAMBIA AND GUINEA.

Climate and Temperature of Senegambia, 68
 Winds—Temperature of Guinea—Winds—Hurricanes, 68
 The Harmattan—Mountains, 68
 Rivers—The Senegal—The Gambia, 69

Vegetation—Forest Trees, 69
 Aromatic Plants, 69
 Gums—Alimentary Plants, 70
 Guinea Grass—Animals, 70
 Monkeys, 70
 Domestic Animals—Insects, 70, 71
 Termites—Cowries—Minerals—Gold Mines, 71
 Other Minerals—French Settlements, 71
 Kingdom of Owah—The Foulahs—Extension of this People, 71, 72
 Serracolets—Kingdom of Galam, 72
 The Mandingos—The Bambookans, 72
 Jallonkadoo—The Yalofs, 72
 Emperor of the Yalofs—Detached States—Kingdom of Sallum—Palace of Kahan, 73
 The Serreres—Petty States—The Feloops, 73
 The Soosoos—Laws and Manners, 73
 The Papels, 73, 74
 Portuguese Settlements—Bissajos Islands, 74
 Bulam—Manners of the People—Rio Grande—The Biafars, 74
 The Naloes—Sierra Leone—Philanthropic Settlement, 74, 75
 Slave Trade—Liberated Slaves—Commerce, 75
 Division of Guinea into Coasts—Productions of the Grain Coast, 75, 76
 Quoya and Hondo Countries, &c.—Manners, 76
 Ivory Coast—The Quaquas—The Gold Coast—European Settlements, 76
 Accounts of the Interior—Cultivation of the Soil, 76, 77
 Diversities of Soil—Inland Nations—The Ashantees, 77
 Slave Coast—Kingdom of Dahomey, 77
 Barbarous Customs—The Eyees, 77, 78
 Kingdom of Benin, 78
 Laws—Customs—Festivals—Kingdoms of Waree, Calabar, &c.—River of Cameroons, 78
 River of Gaboon—The Calbongos, the Biafras, and the Ibbos, 78

BOOK LXVII.

THE RIVER NIGER AND NIGRITIA.

Discussions on the Niger—Data of Ptolemy, 79
 Arabian data, 79
 Hypothesis of M. Reichard—First Argument, 79
 Mass of Water of the Niger, 80
 Second Argument, 80
 Third Argument, 80
 Subordinate Arguments—Observations on the Name of the Ooilil Island, 80, 81
 Hypothesis of the Identity of the Niger and Nile—Navigation from Tombuctoo to Cairo, 81
 Objections, 81
 Probable Results, 81, 82

 The Hovas, or Ambolans—Their Proficiency in the Arts, . . . 141
 The Andrantsayes, . . . 141
 Southern Coast—The Country of the Buques—Different
 Nations, . . . 141
 The Seclaves—City of Mouzangaye—The Madecasses—Ara-
 bian Colonies, . . . 141, 142
 Two Ancient Races—Madecasse Language, . . . 142
 Political State—Castes—Priests, and Sorcerers—Circumcis-
 ion, . . . 142, 143
 Ordeal by Poison, . . . 142
 Singular Imprecation—Alliance of Blood—The Mascarenha
 Isles, . . . 143
 Isle of Bourbon—Mountains—Volcano—General Appearance, . . . 143
 St. Denis—Different Cultures, . . . 144
 Produce in Corn—Errors of Administration—Revenue, . . . 144
 Population—Isle of France—Cultivation, . . . 144
 Mountains—Pitons—Cities, . . . 144, 145
 Picturesque Beauties—Population, . . . 145
 Island of Rodriguez—Researches of M. Buache, on the Island
 of Juan de Lisboa—Ancient Charts, . . . 145
 The Island is Condemned—Recent Assurances of its Exist-
 ence, . . . 145
 Voyage of M. Boynot—Discovery of M. Sornin, . . . 146
 New Official Researches, . . . 146
 Hypothesis of M. Epidariste Collin, . . . 146
 Islands of Saint Paul and Amsterdam—Physical Description
 —Confusion on the Subject of these Islands, . . . 147
 Kerguelen's Land—Marion and Prince Edward Isles—Dis-
 cussion on Dina and Marseveen, . . . 147
 Hypothesis of M. Buache, . . . 147
 Observations on this Hypothesis, . . . 148

BOOK LXXIV.

AFRICA.

Continuation of the Description of Africa.—The Western African Islands.

African Ocean—Circumcision Island, . . . 149
 Tristan d'Acunha Islands—Island of Saint Helena—Physical
 Details, . . . 149
 Town—Historical Details—Ascension Island, . . . 149, 150
 Islands in the Gulf of Guinea—Fernando Po—Prince's Island, . . . 150
 Island of St. Thomas—Climate—Productions, . . . 150
 Political and Moral State—Annabona Island, . . . 150
 Island of St. Matthew—Sea of Thunder—Cape Verd Islands
 —San-Iago, . . . 150, 151
 Productions—Mountains—Towns, . . . 151
 Mayo, Fuego, &c.—St. Vincent, St. Nicholas, &c.—The Sea
 of Sedge, or Mar de Sargasso, . . . 151
 Canary Islands—Lancerota, . . . 151
 Ancient Inhabitants—Forteventura—Great Canary, . . . 151, 152
 Teneriffe—The Peak—Its Height, . . . 152
 Productions of the Island—The Dragon Tree of Orotava, . . . 152
 Towns of Teneriffe—Gomera Island—Palma Island, . . . 152, 153
 Ferro Island—Holy Tree, . . . 153
 Population of the Canaries—Spanish Islanders—The Guan-
 ches, . . . 153
 Manners of this People, . . . 153
 Mummies of the Guanches, . . . 153, 154
 Guanche Language—Saint Brandon Island, . . . 154
 Island of Madeira—Mountains—Climate and Seasons, . . . 154, 155
 Trees—Sugar Canes—Vineyards, . . . 155
 Different Productions—Population, . . . 155

Town of Funchal—Revenue,	155
Island of Porto Santo—The Azores—General Appearance— Nature of the Soil and Climate,	155, 156
Productions—Population—Exportation,	156
Island of Saint Michael—The Valley of Furnas,	156
Culture and Productions—Towns—Temporary Volcanic Islet,	156, 157
Its Appearance in 1638,	157
Remarks on the Date of this Phenomenon—Appearance in 1720,	157
Appearance in 1811,	157
Saint Mary Island—Terceira Island—Soil and Productions— Inhabitants,	158
St. George Island—Graciosa Island—Fayal Island—Valley called the Caldron,	158
Climate and Productions—Towns—Pico Island—Volcano, or Peak of the Azores,	158
Productions—Origin of the Inhabitants,	158, 159
Flores Island—Corvo Island,	159

TABLE of Geographical Positions of Africa, &c.	160—162
--	---------

BOOK LXXV.

DESCRIPTION OF AMERICA.

General Reflections—Origin of the Americans.

Discovery of America—Configuration of America,	163
Points of resemblance common to both Continents,	163
On the term <i>New Continent</i> ,	163
Level of the Country—Elevated and Low Regions,	163
Savannas, Llanos, and Pampas,	163

RIVERS—Their Length and Course—Remarks on their Basins,	164
Great number of Lakes,	164

CLIMATES—Two general Climates—Causes of the Low Tem- perature,	164, 165
Mineralogical Riches,	165

ANIMALS—Vegetable Productions—Peculiarity regarding its Animals,	165
Origin of its Animals—Analogies and Differences—Fossil Animals,	165, 166
Physical characters of the Natives,	166
Anomalies,	166
Colours of the Skin,	167
Exceptions,	167
Beard of the Americans,	167
The Americans are all of the same Nation,	167

LANGUAGES—Researches respecting them—Analogies of the Asiatic and American words,	168
Result of these Researches,	168, 169
Extent and analogy of the different idioms:—	
1. In South America,	169
2. In North America,	169
3. In the Arctic Regions,	169
Cause of this multiplicity of Idioms,	169, 170
Peculiar genius of the American Languages—General Affin- ity of the Conjugations—Other Peculiarities in the Conju- gations,	170
Ancient American Monuments,	170
Manners and Customs,	170
Analogy of their Religious Systems,	171
Known Migrations of the American People,	171
Hypotheses Respecting the Place of their Departure,	171
Various Traditions,	171
Concluding Result,	172
Hypotheses respecting the origin of the Americans,	172
Hebrew Hypothesis,	172

Egyptian Hypothesis,	172
Hypothesis of Grotius,	172
Asiatic Hypothesis,	172
Mixed Hypothesis,	172, 173

TABLE of the Geographical connexion of the American and <i>Asiatic Languages</i> ,	173—176
---	---------

BOOK LXXVI.

AMERICA.

Description of America—Researches concerning the Navigation of the Icy Sea of the North—North-west Coast of America.

Doubts detailed,	177
Hypothesis of a Polar Continent,	177
Pretended voyage through the Polar Seas,	177, 178
Geographical Contradictions,	178
Physical Contradictions,	178
Origin of these Fables,	178
Navigation of the Frozen Seas—Fixed Ice—Moveable Ice,	179
Obstacles to a Journey by Land,	179
North-West Region—Aleutian Islands,	179
Civil and Political Condition—Manners and Customs detail- ed,	179, 180
Physical Description—Volcanoes, &c.	180
Island of Kodiak,	180
Physical Account of Russian America,	180
Indigenous Tribes—Mount St. Elias,	180, 181
New Archangel—The Kalougians,	181
Port des Français—Commerce of the Russian Company,	181
Continuation of the North-West Region,	181
The Rocky Mountains,	181
Maritime Chain of the North-West—Divisions according to Vancouver,	181, 182
New Georgia,	182
Mountains—Productions—Unknown Bird,	182
Interior of the Country,	182
Pretended Volcanoes—Details concerning the Columbia,	182
Gigantic Firs,	183
Nootka Island,	183
American Establishment—New Hanover,	183
New Cornwall—George III. and Admiralty Islands,	183

INDIGENOUS TRIBES—The Wakash—Their War Dress, 183, 184 Their Fishing Apparatus—Tribes of the Interior of New Georgia—Flattened Heads,	184
Tribes of New Hanover—Sculpture of the Salmon Indians,	184
The Sloua-Cuss Indians—The Atnahs, &c.—Tchinkitane In- dians,	184, 185
Their resemblance to the Aztecs,	185

BOOK LXXVII.

THE DESCRIPTION OF AMERICA CONTINUED.

Regions of the North and North-east; or the country on Mac- kenzie's River, and the country round Hudson's Bay, Labrador, Greenland, Iceland, and Spitzbergen.

General View,	186
Slave Lake,	186
RIVERS—Mackenzie's River—Hearne's River—Rivers of Hudson's Bay,	186
Winipeg or Bourbon Lake,	186
Rigour of the Climate—Atmospherical Phenomena,	186
Barrenness of the Soil—Fisheries,	187
Quadrupeds—Trees and other Vegetables,	187

The Hudson's Bay and North West Companies—Lord Selkirk's Colony, 187
 Names given to these Countries, 187
 The Esquimaux—The Chipiwans—Their means of Subsistence, 188
 Their Superstitions—Northern Indians, 188
 Details concerning their Manners—The Knistenaux, 189
 LABRADOR—Climate and Soil—Vegetables and Animals, 189
 The Labrador Felspar—Establishments of the Moravian Brethren—Labrador Tribes, 190
 Icy Archipelago, 190
 Country round Baffin's Bay, 190, 191

GREENLAND—Remarks concerning Old Greenland—Modern Establishments, 191
 The Soil and Country—Icy Peak—Rocks and Minerals, 191
 Climate—Frost—Smoke—Vegetation—Animals—Whales—The Seal, 192
 Exportations, 192
 The Indigenous Greenlanders—Their Language—Their True Name, 192
 Connexion with the Esquimaux—Their Canoes, 192
 Explanation of a Passage of Cornelius Nepos, 193
 Character of the Greenlanders—Christian Missions, 193
 Superstitions—Priests or Sorcerers, 193

ICELAND—Its Geographical Situation, 193
 Rocks—Mountains—Lava—Volcanoes, 194
 Volcanic Islet—Hot Springs, 194
 The Geyser—The Strok, 194
 Mineral Springs—Surturbrand—Minerals—Hills of Sulphur, 194, 195
 Air and Climate—Habitual Severity of the Climate, 195
 Vegetation—Ancient Forests—Floating Wood—Domestic Animals—The Rein-Deer, 195
 Foxes—Falcons—Fish, 195
 Provinces and Towns, 196
 Commerce—The Icelanders—Arts and Trades, 196
 Social Intercourse—Dress, 196
 Intelligence and Literature, 196
 Lands to the North of Iceland—Island of Jan Mayen, 196

SPITZBERGEN—Description of it, 196, 197
 Whales—The Whale Fishery—The Horn of the Narhval, 197
 Spermaceti, 197
 Remarks concerning the Floating Wood, 198
 Theory of the origin of this Wood, 198

BOOK LXXVIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Canada, Nova Scotia, and Newfoundland.

CANADA—Lake Superior—Lake Huron—Lake Erie, 199
 Niagara River—Lake Ontario—River St. Lawrence—Rivers and Cascades, 199
 Soil and Climate—Agriculture—Plants—Forest Trees—Maple Sugar—Animals—Metals—Topographical Divisions—Towns, 200, 201
 QUEBEC—Montreal, 201, 202
 Towns of Upper Canada, 202
 Peninsula of Upper Canada, 203
 Population, 203
 French inhabitants—Character of the French settlers, 203
 Appearance—Amusements—Society, 203, 204
 Education—Laws and Government—Revenue and Expenses, 204
 Exports and imports—Military importance, 205
 SAVAGE TRIBES—The Hurons—The Iroquois—The Agniers, 205
 Different Tribes—Gaspé, its ancient inhabitants, 205
 New Brunswick—Productions—Commerce—Towns—Acadia or Nova Scotia, 206

Climate—Trees, 206
 Towns and Harbours—Islands—Cape Breton, 206
 Louisbourg—Island of St. John, 207
 Island of Anticosti—Terra Nova, or Newfoundland, 207
 Productions—Climate—Fishes, 207
 Newfoundland Dog—Population—Towns—The Bermudas, 207
 Soil and Productions—Towns—Discovery of the Bermudas, 207, 208

COMMERCIAL TABLES.—*Extracted from the Parliamentary Reports. An account of the number of Ships and Men employed in the Trade of the British Colonies in North America, from the year 1814 to the year 1820, 209*
Real value of British and Irish Produce and Manufactures exported from Great Britain, as ascertained from the declarations of the exporters, 209
British and Irish Produce and Manufactures, 209

BOOK LXXIX.

THE DESCRIPTION OF AMERICA CONTINUED.

United States—Nature of the Country—Mountains, Rivers, Animals, Plants, &c.

Aspect of the Country—Historical Sketch, 210
 Extent and Limits, 210
 Indians, 211
 Mountains, 211
 Geology, 211, 212
 Lakes and Swamps, 212

RIVERS—Mississippi, 212
 Eastern Rivers, 213
 Climate, 213
 Yellow Fever, 213
 Vegetable Kingdom, 213, 214
 Flora of Southern States, 214
 Flora of the Calcareous Region, 215
 Public Lands, 215
 Agriculture, 216
 Animals, 216
 Minerals, 216

BOOK LXXX.

THE DESCRIPTION OF AMERICA CONTINUED.

Description of the United States continued—Topography and Statistics of the several States.

Maine—New Hampshire, 217
 Vermont, 217
 Massachusetts, 218
 Rhode Island, 218
 Connecticut, 218
 New York, 219
 New Jersey—Pennsylvania, 220
 Philadelphia Prison, 220, 221
 Manners in the Middle States, 221
 Delaware—Maryland, 222
 Virginia, 222
 Federal District, 223
 North Carolina—South Carolina, 223, 224
 Georgia—Alabama—Mississippi, 224
 Louisiana, 224, 225
 Tennessee—Kentucky, 225
 Ohio, 226
 Indiana—Illinois—Missouri, 226

TERRITORIES—Florida,	226
Michigan—Arkansas—North-West Territory,	227
Missouri Territory,	227
Rocky Mountains,	227
Western Territory,	227

BOOK LXXXI.

THE DESCRIPTION OF AMERICA CONTINUED.

United States continued—The Aborigines—Manners and Character of the various Tribes.

Persons, Dress, and Ornaments—Houses,	230
Government,	230
Women,	231
Superstitions,	231
Their Wars,	231
Manners,	232
Numbers,	232, 233

BOOK LXXXII.

THE DESCRIPTION OF AMERICA CONTINUED.

United States continued—Manufactures, Commerce, Government, Religion, Manners, and Literature.

Manufactures,	234
Commerce—Canals,	234
Banks—Money,	234
Government,	235
Two kinds of Government,	235
The European—The American,	235
President—Senate,	235, 236
House of Representatives,	236
Forms and Composition of Congress,	236
Pay of Public Officers,	236, 237
Federal Judiciary,	237
State Governments—Representatives—Senators,	237
Amending Constitutions,	237, 238
Judges,	238
Elections,	238
Revenue—Debt,	239
Army—Militia—Navy,	240
Religion,	240
Sects,	240, 241
Colleges—Schools,	241
Literature,	241
Newspapers,	242

TABLE of the Population of the United States, in 1790, 1800, 1810, and 1820, according to the Returns, 242

TABLE showing the Extent, Population, and Representation of each State, and the Proportion of its Inhabitants engaged respectively in Agriculture, Manufactures, and Commerce, according to the census of 1820, 243

POPULATION of the United States, according to the census of 1820, 243

TABLE of the Amount of the Valuations of Lands, Lots, and Dwelling-Houses, and of Slaves, in the several States, made under the Acts of Congress, of the 22d July 1813 and 9th January 1815, as returned and revised by the Board of Principal Assessors, with the corresponding Valuations in 1799, 244

TABLE of Manufactures of the United States, according to returns made to the Marshals in 1810, 244

Cotton of Domestic Growth Exported from 1805 to 1817, 244

TABLE of Exports of certain Classes of Domestic Produce, at three different periods 244

TABLE of the Tonnage of each State, and of the whole Union, in 1821,	244
TABLE of Imports of the United States for 1821,	245
TABLE of Exports of the United States for 1821,	245
TABLE of the Exports of the United States from 1800 to 1821,	245
TABLE of the Post-Office Establishment of the United States from 1790 to 1821,	246
TABLE of the Public Debt, Revenue, and Expenditure of the United States, from 1791 to 1822,	246

BOOK LXXXIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Mexico, comprising New Mexico and the Captain-Generalship of Guatemala—General Physical Description.

General Sketch of Spanish America,	247
Great Political Divisions,	247
Denominations of Mexico,	247
Aztec or Mexican Kingdom—Anahuac,	247

NEW SPAIN—Dimensions—Limits,	248
Division into Intendancies, Provinces and Kingdoms,	248
On the Denomination of Internal Provinces,	249
Comparison of the Population,	249
Distribution by Climates,	249
Mountains,	250
Mexican Plateau—Levels of the Plateau—Eastern and Western Declivity,	250
Direction of the Cordillera—Volcanoes of Mexico,	250
Continuation of the Cordillera—Sierra de Mimbres,	250, 251
Granitic Rocks—Porphyritic Rocks,	251
Singular Shape of these Rocks,	251
Detailed Account of the Volcanoes,	251
Mines,	252
Particular advantage of the Mexican Mines,	252
Rivers—Deficiency of Water—Lakes,	252
The Lake of Nicaragua,	252
Communication between the two Oceans,	252
Sea Coasts,	253
Bars—Navigation and Winds—Climate,	253
Hot Countries—Temperate Countries—Cold Countries,	253, 254
Seasons—Periodical Rains,	254
Cause of the different Temperatures—Temperature of the Internal Provinces,	254
Dryness of the Soil—Limits of perpetual Snow,	254
Saline efflorescences—Salubrity,	255
Vegetable Productions—In the Hot Region—In the Temperate Region—In the Cold Region,	255
Alimentary Plants,	256
Fruit Trees—The Sugar Cane—Indigo—Cacao,	256
Cochineal, &c.—Dye-woods,	256
Animals—The Dumb Dog—Domestic Animals,	256, 257

BOOK LXXXIV.

THE DESCRIPTION OF AMERICA CONTINUED.

Mexico, including New Mexico and the Captain-Generalship of Guatemala—Account of the Inhabitants.

Population enumerated—Its Increase—Obstacles,	258
The Small-pox—The Mexican Plague—Famines,	258, 259
Is Working in the Mines pernicious?	259
Classes of the Inhabitants,	259
The Indigenous Natives more numerous than before the Discovery,	259
Physical character of the Indigenous Natives,	259, 260
Ancient Civilization—Origin of this Civilization,	260

Moral Qualities—Assimilation of Religious belief, . . . 260, 261
 Their talent for Painting and Sculpture—Want of Imagination, . . . 261
 Their taste for Flowers—Wild Indians, . . . 261
 Hereditary Castes among the Indians—Conduct of the Caciques, . . . 261, 262
 Misery of the Indians, . . . 262
 Imposts—Civil Rights—Administration, . . . 262
 Mexican Spaniards—The Chapetons and Creoles, . . . 262
 Castes of Mixed Blood—The Mestizoes, . . . 263
 The Mulattoes—The Chinos or Zambos, . . . 263
 The Quarterons and Quinterons—Prerogatives of the Whites, 263
 Negroes, . . . 263
 Condition of the Slaves—Languages Spoken in Mexico—Aztec, . . . 263, 264
 Otomite—The Tarasc, &c.—Idioms of California, . . . 264
 Huastec Language—Idioms of Oaxaca, . . . 264
 The Maya Tongue—Languages of Guatimala, . . . 264

BOOK LXXXV.

THE DESCRIPTION OF AMERICA CONTINUED.

Continuation and Conclusion of the Description of Mexico—Topography of the Provinces and Towns.

New Albion—The Natives, . . . 265
 New California—Remarkable Places, . . . 265
 Indigenous Tribes—Old California—Physical Description, 265
 Indigenous Tribes—Missions, . . . 266
 New Mexico—Towns—Productions—Mountains, . . . 266
 Interesting Phenomenon of Physical Geography, . . . 266
 Indians—The Apaches—Manner of making War, . . . 267
 The Keres—The Nabajoa and the Moqui Indians, . . . 267
 Towns and Remarkable Edifices, . . . 267
 Intendancy of Sonora—Pimeria—New Navarre, &c. . . 267
 Cinaloa—Culiacan—New Biscay or the Intendancy of Durango, . . . 267, 268
 Intendancy of San Louis Potosi—New Leon, . . . 268
 Province of Texas—New Santander, . . . 268
 New Galicia, or the Intendancies of Zacatecas and Guadaluajara, . . . 268
 Mechoacan, or the Intendancies of Guanaxuato and Valladolid, . . . 268
 Indigenous Inhabitants—Towns, . . . 269
 The Intendancy of Mexico—Natural Curiosities—City of Mexico, . . . 269
 Civilization—Manners—Floating Gardens—Mechanical Arts, . . . 269, 270
 Aztec Monuments—Teoyaomiqui—Pyramids of the Sun and Moon, . . . 270
 Different Towns—The Hand-Tree, . . . 270
 The Intendancy of Puebla de los Angeles—Pyramid of Cholula—Towns, . . . 271
 Republic of Tlascal, . . . 271
 The Intendancy of Vera Cruz—Pyramid of Papantla—Towns—Tabasco, . . . 271
 Intendancy of Oaxaca—Remarkable Ruins, . . . 271, 272
 Yucatan—Ancient Inhabitants—Physical Description, . . . 272
 Towns—English Yucatan—Kingdom of Guatimala—Province of Guatimala, . . . 272
 Towns—Destruction of Guatimala, . . . 272
 Province of Chiapa—Ancient Inhabitants, . . . 273
 Province of Vera Paz—Remarkable Productions—Province of Honduras—Floating Islands, . . . 273
 Mosquito Indians—English Establishments, . . . 273
 Province of Nicaragua—Lake of Nicaragua, . . . 274
 Volcano of Masaya—Productions—Indigenous Natives—Their Idioms, Laws and Customs, . . . 274
 Province of Costa Rica—Veragua, . . . 274

BOOK LXXXVI.

THE DESCRIPTION OF AMERICA CONTINUED.

General Physical Description of Spanish South America.

Extent of South America, . . . 275
 General Physical Aspect, . . . 275
 RIVERS—The Amazon, or the River of the Amazons—The Ucayal, . . . 275
 The High Maranon—Different tributary streams, . . . 275
 The Madeira—River of Para, . . . 276
 The Rio de la Plata—The Paraguay, . . . 276
 The Oronoko—Golfo Triste—Dragon's Mouth, . . . 276
 Cataracts of the Oronoko, . . . 277
 The Casiquiari—Lakes without any outlet, . . . 277
 The Andes—General Direction—Chain of Caraccas, . . . 277
 Little Chain of the Isthmus—Cordilleras of New Granada, 278
 Passage of the Andes, . . . 278
 Defile of Quindiu—The Quebradas—Cordillera of Quito, . 278
 Elevated Plateaus—Appearances of the Higher Summits, 278, 279
 Elevation of the Andes of Quito—Structure and Geological Composition, . . . 279
 Volcanoes, . . . 279
 Cordillera of Peru, . . . 279
 Cordillera of Chili—Situation of the Mines—Fossil Remains, 280
 Climates and Temperature—Three Zones—Cold Zone—Hot Zone, . . . 280
 Temperate Zone—Vegetation—Region of the Palm Tree, . 280
 Region of the Cinchona—Region of the Oaks, . . . 281
 Region of Shrubs—Vegetation of the Paramos—Region of Alpine plants, . . . 281
 Region of the Grasses—Cultivated Plants, . . . 281
 Animal Kingdom—Animals of the Plains and Marshes, . . 282
 Animals of the Hills and Mountains—Animals of the Cold Zone, . . . 282
 The Coador, . . . 282, 283

BOOK LXXXVII.

THE DESCRIPTION OF AMERICA CONTINUED.

Particular Description of Caraccas, New Granada and Quito.

Different Denominations, . . . 284
 Divisions—Description of CARACCAS—Climate—Productions, 284
 Mines—Forests—The Lake of Maracaibo—The Lake of Valencia, . . . 284
 Cultivation—Cacao, &c.—Commerce—Principal Towns, . . 285
 The Island of Margarita—Population—Spaniards, . . . 285, 286
 French Colony—Army—Revenue—Description of Spanish Guiana, . . . 286
 Productions—Importance of the Oronoko, . . . 286
 Phenomenon of the Black Waters—The Llanos, . . . 286
 INDIGENOUS TRIBES—The Ottomacs, earth-eaters, . . . 287
 The Betoys and Maypures—The Guaicas—The Guajaribes, 287
 The Caribs—Remarks on their Languages—Figures engraved on the Rocks, . . . 287
 Description of NEW GRENADA, . . . 287
 Climate and Temperature—Rivers—Vegetation, . . . 288
 Mineral Productions—Platinum—Gold—Gold Washing of Choco, . . . 288
 Town and Plateau of Bogota—Cataract of Tequendama, . . 289
 Natural Bridges of Icononzo, . . . 289, 290
 Towns on the Isthmus—Towns on the North or Atlantic Sea, 290
 Air Volcanoes—Towns of the Interior, . . . 290, 291
 Province of Choco—Island of Gorgona, . . . 291
 Canal of Raspadura—Towns of the Kingdom of Quito, . . 291
 Provinces of the Interior—Volcanoes of Quito, . . . 291, 293
 Pichincha—Cotopaxi, . . . 292

Situation of these Volcanoes—Archipelago of the Gallapagos Islands, 292
 Natives Tribes of New Grenada—Ancient Tribes of Quito, 292
 Tribes of Popayan and Maynas—The Omaguas, 293
 Fabulous Traditions of the Muyscas—Bochica a Prophet and Lawgiver, 293
 Political System of Bochica, 293
 Muyscan Calendar, 293, 294

BOOK LXXXVIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Description of Peru according to its ancient limits.

Extent of Peru—Natural Divisions—Lower Peru, 295
 Upper Peru—Interior Peru—Agriculture—Roads, 295
 Vegetable and Animal Productions—Wool, 295, 296
 Riches—Gold—Silver Mines—Mercury—Minerals, 296
 Mines—Commerce—Commerce with Buenos Ayres, 296, 297
 Trade with the other Colonies—Commerce with Spain, 297, 298
 Towns of Peru—Lima—Earthquakes—Cuzco, 298
 Towns of Lower Peru, 299
 Towns of Upper Peru—Sugar Cane—Lake Titicaca, 299, 300
 Bridge of Rushes—Towns of Southern Peru, 300
 Potosi—Natives of Peru, 300, 301
 Roads, Canals, and Public Buildings—Character of the Peruvians, 301
 Forced labour of the Mines, 301, 302
 Decrease of Population, 302
 Longevity of the Natives—Mestizoes, 303
 Negroes—Peruvian Languages, 303
 Interior Peru—Natives, 303
 Dialects—Government—Marriages—Religion, 303
 Mohanes and Wizards—Talismans, 304
 Immortality of the Soul—Metempsychosis, 304
 Lamentations for the Dead—Cannibals, 304
 Agriculture—Hatchets—War—Diversions—Towns, 304
 Missions—Climate of Interior Peru—Roads—Productions, 305

BOOK LXXXIX.

THE DESCRIPTION OF AMERICA CONTINUED.

Chili, Paraguay, Terra Magellanica, or Patagonia.

CHILI—Plants—Animals—Provinces and Towns, 306
 Population and Inhabitants—Islands, 307
 Eastern Chili, or Cuyo—Tucuman, 307, 308
 Paraguay or Buenos Ayres—Aspect of the Country, 308
 Horses and Oxen, 309
 Chaco, Native Tribes—Abipons, 309
 Paraguay Proper—Mines—Vegetables, 309
 Animals—Towns, 309, 310
 Provinces on the Uruguay—Native Tribes—Towns, 310
 Missions of the Jesuits, 310
 Complaints against the Jesuits—Commerce of the Jesuits, 310, 311
 Expulsion of the Jesuits, 311
 Buenos Ayres—Character of the Husbandmen, 311
 Shepherds—Banditti—Productions of Buenos Ayres, 312
 Unoccupied Regions—Araucanians—Different Tribes, 312
 Warfare—Religion—Customs, 312, 313
 Seasons—Games—Polygamy, 313, 314
 Trade—Tuyu—The Puelches—The Pampas, 314
 Comarca Desierta—Country of the Cesares, 314
 Patagonia, 315
 Climate of Patagonia—Plains and Mountains, 315
 Plants—Straits of Magellan, 315, 316
 Terra del Fuego—Falkland Islands, &c. 316
 New South Shetland, 317

BOOK XC.

THE DESCRIPTION OF AMERICA CONTINUED.

General Observations on Spanish America.

Extent of Country—Population—Castes, 318
 Political Institutions—Civilization—Indians, 318
 Encomiendas—Repartimientos—Present State of the Indians, 318
 Administration—System of Administration, 319
 Finance—Improvements, 319
 Advantages of Free Trade—Defects in Galvez' Administration, 319
 Mines—Scarcity of Mercury, 320
 Annual Produce of the Mines in Spanish America at the beginning of the Nineteenth century, 320
 Revenue of the Spanish Colonies, 320, 321
 Spain's Title to her South American Colonies, 321
 Oppression of the Colonists, 321
 Causes of Independence—Independence of South America, 322
 Slavery—Liberty of the Press—Public Instruction, 322
 Improvements—Governments, 322
 Supreme Director—Independence of the Colonists, 323

Estimate of the Population of the Provinces of Buenos Ayres, Cordova, Tucuman, Mendoza, and Salta, under the Names of the Different Towns and Districts which send Representatives to Congress, 324
 TABLE showing the Amount of the National Revenue of the United Provinces in 1817, the Expenditure and the Balance remaining in the Treasury at the end of the same year, 324
 Population of Columbia, 324
 Statement of the Revenue of Venezuela and New Granada, 324

BOOK XCI.

THE DESCRIPTION OF AMERICA CONTINUED.

Kingdom of Brazil.

Line of Demarkation, 325
 Disputes about the Limits, 325
 Name of Brazil, 325
 Mountains on the Coast—Rocks, 325
 Northern Chain—Interior Chain—Central Plateau, 326
 Temporary Lake of Xarayes—Reefs—Inundations, 326
 Torrents—Climate of the Interior, 326, 327
 Of the Northern Coast—Of Rio Janeiro, 327
 Of the Island of St. Catharine's—Diseases, 327
 Minerals—Diamond District—Topazes, 327, 328
 Gold Mines, 328, 329
 Iron—Copper—Scarcity of Salt, 329

PLANTS—Variety of Palms, 329, 330
 Parasitical Plants—Superior Quality of the Wood—Great size of the Trees, 330
 Rapidity of their Growth—Plants used in Dyeing, 330
 Alimentary Plants—Aromatic Plants, Spices, &c. 330
 Animals—Birds—Departments, 331
 Ecclesiastical Divisions—Courts of Justice, 331
 Captaincy of Rio Janeiro—Capital of Brazil, 332
 Captaincy of Rio Grande, 332
 Capital of the District—St. Catharine's, 332
 Parishes—Those on the opposite Coast—Plain of Corritiva, 332
 Town and District of Santos—Road to San Paulo, 333
 Town of San Paulo—Population, 333
 Character of the Inhabitants—Origin of the Paulistas, 333
 Town of Porto Seguro—Capitania of Minas Geraes—Agriculture—Arts, 334
 Comarcas and Towns, 334
 Roads—Severity of the Laws against Smugglers—Inhabitants of Tejuco—Province of Goyaz, 334
 Government of Bahia—Productions—Chief Town of the Province, 335
 Sergippe, 335

Government of Pernambuco—Capital—Paraiba, 335
 Paiuhy—Government of Maranham—Government of Gran
 Para, 335, 336
 Mattogrosso, 336
 NATIVES, 336
 The Boticudos, 336
 The Puris—The Tupis, 336
 The Topinambos—Tribes in the Interior—The Guay-
 coros, 336, 337
 Bravery of the Brazilians, 337
 Language—Different Dialects, 337
 Actual State of Brazil—Total Population—The Court, 337, 338
 Revenue—Mulattoes and Negroes—Marine and Military
 Establishment, 338

BOOK XCII.

THE DESCRIPTION OF AMERICA CONTINUED.

Guiana.

Name of the Country—Coast—Low Grounds, 339
 Hills—Rivers, 339
 Seasons—Heat—Prevailing Winds—Diseases, 339, 340
 Inundations—Vegetation—Fruit Trees, 340
 Aromatic Plants—Medicinal Plants—Poisons—Forest Trees, 340
 Parasitical Plants—Quadrupeds, 340
 Ant Bears—Cancrophagus, 341
 Bats—Reptiles—Birds—Fish, 341
 ENGLISH GUIANA—Essequibo, 341
 Demerary—Berbice, 341
 DUTCH GUIANA—Surinam, 341
 Appearance of the Country—Revolted Negroes, . . . 341, 342
 FRENCH GUIANA—Cayenne—Indian Tribes, 342
 The Galibis—Different Tribes—Traditions concerning El
 Dorado, 342, 343

BOOK XCIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Columbian Archipelago, or the Greater and Lesser Antilles.

Name—Divisions, 344
 Caribbean Sea—Gulf Stream, 344
 Transparency of the Water—Fresh Water Springs in the Sea, 344
 Mountains and Rocks, 345
 Climate and Seasons, 345
 Diseases—Animals, 345
 Colibri—Fruit Trees, 345, 346
 Shrubs and Flowers, 346
 Alimentary Plants—Sugar cane—Field of Canes, . . . 346
 Conflagration of a Cane Field—Cotton and Coffee, . . 346, 347
 Natives, 347
 CUBA, 347
 Minerals—Vegetables—Army—Principal Towns, . . . 347
 JAMAICA, 347
 Mountains—Climate—Productions, 348
 Divisions—Government—Towns, 348
 Population—Exports, 348
 ST. DOMINGO—Mountains, 348
 Metals—Minerals—Spanish Settlements—Productions, . . 349

Towns—Tomb of Columbus—Bay of Samana—French Set-
 tlements—Productions, 349
 Towns—Kingdom and Republic of Haiti, 349
 PORTO-RICO—Productions—Towns—Biequen—Popula-
 tion, 349, 350
 BAHAMA or LUCAYOS ISLANDS—Inhabitants—Productions, . 350
 VIRGIN ISLANDS, 350
 DANISH ANTILLES—Santa Cruz—St. Thomas, 350
 Anguilla—St. Martin—St. Bartholemew, 350
 DUTCH ANTILLES—St. Eustatia, 350
 Saba, 351
 BRITISH LEEWARD ISLANDS—Antigua, 351
 Barbuda—St. Christopher's—Nevis and Montserrat—Guada-
 loupe, 351
 Population—Volcanoes—Productions—Towns, 351
 Dominica—Martinico—Mountains, 352
 Population—Towns—St. Lucia—St. Vincent, 352
 Black Caribs—Grenadines—Grenada, 352
 Barbadoes—Tobago, 352, 353
 Trinidad—Bituminous Lake, 353
 Towns and Harbours, 353
 DUTCH ISLANDS—Curaçoa, 353
 Wealth of the Antilles—Increase of Population, 353
 Duties—Exports—State of the Negroes, 354
 Means of improving the Condition of the Slaves, 354
 The Appearance of a Morning in the Antilles, 354
 A Hurricane, 355

TABLE of the Principal Geographical Positions of America,
 determined with some accuracy, 356—358

BOOK XCIV.

EUROPE.

Its Physical Geography—Seas, Lakes, Rivers, and Mountains.

Introduction, 359
 Limits of Europe, 359
 Superficial Extent—Dimensions—Centre, 360
 SEAS AND GULFS—Atlantic Ocean—White Sea—North or
 German Sea, 360
 Jutland Channel (Skager-Rack)—Katte-Gat, 360
 The Baltic—British Channel—Bay of Biscay, 360, 361
 The Mediterranean—Italian Sea—Adriatic Sea—Archipel-
 ago—Black Sea, 361
 Currents in the Mediterranean, 361
 Caspian Sea—Coasts of Europe, 361
 Superficial Extent of the European Seas and Gulfs, . . . 362
 LAKES—Lakes to the East of the Baltic, 362
 Scandinavian Lakes—Lakes to the South of the Baltic—
 Alpine Lakes, 362
 Italian Lakes—Irish Lakes—The proportion between the
 Basins in Europe—The Six largest Rivers in Europe, . . 362
 EUROPEAN MOUNTAINS—The Table-Land of Waldai—The
 Dofrine Mountains, 363
 The Caledonian Mountains—The Great Northern Plain—
 The Alps, 363
 The Appennines—The Dinarian Alps, 363
 Jura, Vosges—The Cevennes—The Pyrenees—The Alpujar-
 ras—Mount Hæmus, 364
 Olympus, Pindus, &c.—The Carpathian and Hercynian
 Mountains, 364

EUROPEAN PLAINS AND VALLEYS—Upper and Lower Europe,	364
<i>Table of the different Rivers in Europe,</i>	365
<i>Superficial Extent of different Basins in Europe,</i>	366
<i>Height of the Principal Mountains in Europe,</i>	366—370
<i>Height of Buildings,</i>	370

BOOK XCV.

EUROPE CONTINUED.

Climate—Distribution of Animals and Plants.

Prejudices concerning Climate,	371
Errors of the Learned—Causes of European Climates—Asiatic Influence—East Winds,	371
Influence of Africa—South winds,	371, 372
Oceanic Influence—Conflict between the Maritime and Continental Winds,	372
Insular Climates,	372
South-west Winds—Progress of the Spring—Triangular Arrangement of European Climates—Heptagonal Arrangement,	372
Elevation of the Surface—Snow Line,	373
Level of Central Europe,	373
Level of the Sarmatian Plains—Level of Russia—Isothermal Lines,	373
Curvature of the Isothermal Lines in Europe,	373
Humidity of the Atmosphere—Salubrity of the Air,	374
Vegetation of the Oceanic Climate—Vegetation of the Asiatic Climate,	374
Effects of the Caspian Climate—Vegetation of the Mediterranean Climate,	375
Difference between the Vegetation of the West and East,	375
Levels of Vegetation,	375
Grain—The Vine—Hops—Wine and Beer—Oil and Butter,	376
Fruit Trees—Flax and Hemp,	376
Trees and Shrubs, growing spontaneously,	376, 377
Changes produced by Culture—Animals—In the North—In the East,	377
In the Central Countries of Europe—In the Alps, &c.—In the South,	377
<i>Table of the Physical Regions of Europe,</i>	378—380
<i>Table of Mean Temperatures, according to the Centigrade Thermometer,</i>	380

BOOK XCVI.

EUROPE CONTINUED.

Remarks on the Political Geography of Europe—Nations, Languages, Religion, Political Divisions, Governments, Population, &c.

Origin of European Nations,	381
European Languages,	381
European Races—Greeks—Albanians,	381
Turks—The Slavonians and Finns indigenous to Europe—Slavonian Nations,	381, 382
Walachians—Bulgarians—Finns—Hungarians,	382
Teutonic Nations—Germans,	382
Scandinavians—English—Ancient People of the West and the South,	383
Basques—Celts—Irish, Highlanders—Belgians—Welsh,	383
Latin Language—Modern Languages derived from the Latin—Numerical Relations of these different Languages,	383
Different Tribes speaking other Languages foreign to Europe—Religion—Greek Church—Latin Church—Protestants,	383, 384
Mahometans—Idolaters—Jews—Governments—Monarchies, absolute and limited—Despotism—Republics—Principal Powers,	384

Physical relations between the different States,	384
Constituent Parts of Empires,	385
Population, its distribution,	385
Causes of these results,	385
Maritime and Inland Population,	386
Increase of Population—Necessity of Emigration,	386
The limits that Population may attain in some Countries—Future Migration of Nations—Colonies,	386
Classes of Society—Reigning Families,	387
Nobility—Middle Classes—Authors,	387
Working Classes—Agriculturists and Husbandmen—Soldiers—Political Value of an Individual,	387
Remarks,	387, 388
Value of the Military service,	388
Northern States more powerful,	388
<i>Synoptical Table of ancient and modern European nations, classed by families and languages,</i>	388—394

BOOK XCVII.

EUROPE CONTINUED.

Physical description of Turkey in Europe.

Chains of Mountains,	395
Hæmus Proper,	395
Rhodope—Dardanian Mountains—Pindus,	395
Olympus—Parnassus—Chimera,	395, 396
Insular chains—Mountains in the Island of Andros—Seas—Pontus Euxinus,	396
Hypotheses concerning the Bosphorus,	396
Archipelago,	396, 397
Rivers and Streams,	397
Vale of Tempe—Ancient Lake in Thessaly,	397
Physical changes in Bœotia,	397
Earthquakes—Volcanic Islands,	398
Eruptions,	398
Caverns—Labyrinth in Crete,	399
Cavern in Antiparos—Cave of Trophonius—Fossil Bones,	399
Climate—Climate of the Mountains—Prevailing Winds,	399
North Winds—South Winds—The Zephyr,	399
The Etesian Winds,	400
The Ornithian Winds,	400
Diversity of Temperature—Vegetable Kingdom,	400
Forests on the North and the South of Hæmus,	401
Fruit Trees—Shrubs,	401
Vineyards—Transition of Plants—The Palm,	401
Animal Kingdom,	402
Animals now extinct—Mineral Kingdom—Gold and Silver Mines,	402
Marble,	402
Mines and Minerals in the Islands—Bitumen,	402, 403

BOOK XCVIII.

EUROPE CONTINUED.

Portion of European Turkey to the south of Mount Hæmus and the east of Pindus. Islands.

Ordinary Divisions—Constantinople—Its different names,	404
Port—Circumference—Interior,	404
Fanar—Seraglio,	404
Buildings,	405
Commerce—Pera, Galata—Environs,	405
Adrianople—North-western part of Romania,	405
Passes—Zagora, the Paulianists—Mount Strandschea,	405
Subterranean Town—Gulf of Bourgas—Tekiri-Dag,	406
Southern Coasts—Macedonia,	406
Mountains,	406
Rivers—Mines—Fruitfulness of the Soil,	406, 407

Cotton and Tobacco—Salonica—Mount Athos—Towns in the North-east—In the North-west—In the Centre—In the South—Different Tribes, 407
 Mount Athos—Towns in the North-east, 407
 Towns in the North-west—Central Towns, 408
 Different Tribes, 408
 Thessaly—Manufacturing Towns—The Meteora—Gulf of Volo, 408
 Greece Proper—Productions—Mount Parnassus, 408
 Athens—The Peloponnesus, or Morea—Towns and Fortresses, 409
 Character of the Modern Greeks, 409
 Greek Church—Greek Catholics, 409, 410
 Mainotes, 410
 Cacovouniotes—Candia, or Crete—Mountains, 410
 Climate—Productions—Towns, 410
 Sphachiotes—The Cyclades, 411
 Islands in the Gulf of Athens—Hydra, 411
 Continuation of the Cyclades—Negropont, or Egripo—Northern Sporades, 411
 The Seven Ionian Islands—Corfu, 411, 412
 Paxo—Santa Maura—Cephalonia—Ithaca, 412
 Zante—Cerigo—Ionian Republic, 412

BOOK XCIX.

EUROPE CONTINUED.

Turkey. Western Provinces. Albanians and Proto-Slavonians.

Albano-Dalmatian Mountains—Terraces in Albania and Dalmatia, 413
 Central Table-Land of Dalmatia, 413
 Plain of Kosovo, 413
 Climate, Vegetation—Lower Albania or Epirus—Climate—Productions, 414
 Animals—Valley of Janina, 414
 Walachians on Mount Pindus—Gulf of Arta, 415
 Suliotes—Paramithiotes—Parga, 415
 Philates—Chimariots—Basin of the Aous, 415
 The Nymphæum—Central Albania—Mirdites, 415, 416
 Lake of Ochrida—Course of the Drino—Dibra Upper and Lower, 416
 Upper Albania, Scodra—The Guegues or Guikhes—Their Tribes, 416
 Character of the Albanians—Albanian Women—Religion, 417
 Origin of the Albanians, and of their Language, 417
 Character of the Albanian Language—Connexion with the Japhetic Languages, 417
 Sanscrit Geographical Terms, 418
 Special Character of the Albanian Language, 418
 Connexion between the Albanian and Æolic, 418
 Names of Macedonian Months—Connexion with the Pelasgic, 418
 Names of the Pelasghi, 419
 Connexion with the Hellenic, 419
 Connexion with the Latin, 419
 Celticisms and Germanisms—Unknown Roots, 419
 Names of the Albanians, Skipitar, &c.—Limits of the Illyrian Language, 420
 Albanian Grammar, 421
 Albanian Alphabet, 421
 Cettas and Pharas—Superstitions, 421
 Novel method of Fishing—Montenegro, 422
 Manners—Productions, 422
 Turkish Dalmatia or Herzegovina—Towns and Fortresses—Rivers without outlets—Kullas, 422
 Bosnia and Turkish Croatia, 423
 Vegetable Productions—Corn, 423
 Forests—Animals—Mines and Minerals, 423
 Salt, 424
 Climate—Springs and Rivers, 424
 Principal Towns—Residence of the Pacha—Military Geography, 424, 425
 Language, Manners—Condition of the Women, 425

Religion—Podrinna, and other Districts, 425
 Rascia—Servia—Mountains and Rivers, 425, 426
 Productions—Inhabitants, 426
 Rights—Towns of Lower Servia, 426
 Monuments—Towns in the Interior, 426
 Tomb of Amurath I.—Proto-Slavonians, 427
 Proto-Slavonian Tribes in Thrace, 427
 Proto-Slavonians in Pannonia, &c. 427
 Religion—Arrival of the Slavonians Proper—Invasion of the Country by the Serbi, 428
 Croatian Invasion—Conclusion, 428

BOOK C.

EUROPE CONTINUED.

European Turkey—North-eastern Provinces—Walachians—Zigeunes or Gypsies.

The Bulgarians, their Origin and Migrations—Manners, 429
 Productions of Bulgaria—Towns and Remarkable Places, 429, 430
 Dobrudscha—Dobrudschan Tartars, 430
 Walachia, Origin of the Walachians, 430
 Formation of the Walachian Language, 430
 Names of the Walachians, 431
 Number—Government, 431
 Hospodars, 431
 Divan—Condition of the Peasantry, 431, 432
 Classes of the Peasantry—Privileges—Clergy, 432
 Natural Advantages—Rivers—Productions, 432
 Revenue, Taxes, and Exports, 433
 Divisions—Towns—Bucharest, Society—Turkish Fortresses, 433
 Towns in Little Walachia, 433, 434
 Passes—Moldavia—Climate, 434
 Productions—Wine, 434
 Animals—Cattle—Bees, 434
 Towns, 435
 Jassy, the Capital—Galacz, its Commerce, 435
 Government—Revenue and Expenses, 435
 Character and Manners—Ungareny, 436
 Zigeunes, Gypsies, or Bohemians—Character, 436
 Trades, Arts, &c. 436
 Number—Different Names of the Gypsies, 436
 Traditions—Language—Its Hindoo Character—Relations with the Persian, Slavonic, and Finnish, 437
 Hindoo Origin of the Gypsies—Objections—Indo-European Origin—The Sigynæ, 438
 The Sintii or Sindi, 438
 Ancient Nations of Hindoo Origin in Europe—Conclusion, 438
 Increase and decline of the Turkish power, 439—442

TABLE—The divisions of European Turkey according to Hadgi-Khalifa and Hisar Fenn, compared with those of Ricaut and Marsigli, 442, 443
 TABLE—Christian Kingdom of Bosnia and Servia. Divisions, 443
 Table of the Divisions of the Morea, according to M Pouqueville, 443, 444
 Table of the Population in European Turkey, according to M. Hassel (1823). 444
 Table of the Ottoman Armies, according to M. Hammer, 444

BOOK CI.

EUROPE CONTINUED.

Hungary and its Appendages; Physical Geography.

Introduction, 445
 Mountains—Carpathians Proper—Group of Tatra—Defiles of Jablunka, 445
 The Fatra—Alps of Liptau, 445
 The Hegy-Allya—Lowering of the Carpathian Mountains, 446

Opinion of M. Beudant—Opinion of M. Kitaibel,	446
Transylvanian Mountains,	446
Mountains of the Bannat—Central Mountains—Western Mountains,	447
Plains—Lakes—Lake Balaton,	447
Lake of Neusiedel—Discussion concerning the lake Peiso— Lake of Palics,	447
Marshes—Their extent,	448
Rivers—The Danube—The Theiss,	448
The Save,	449
The Drave—The Paprad—The Aluta—Climate of the Mountains,	449
Climate of the Hills—Climate of the Plains—Endemical Diseases,	449
Geology—Porphyry and Limestone,	449
Rock Salt—Saline Efflorescences,	450
Ancient Lake or Mediterranean—Trachyte Sandstone,	450
Basalt—Metals—Gold and Silver Mines—Tellurium,	450
Iron Mines—Copper Mines,	451
Different Metals—Salt Mines, and Saline Springs—Marbles and Precious Stones,	451
Coal—Vegetable Kingdom—Grain—Wines, Tokay,	451
Different cultivated Plants—Forests—Regions of Vegetation,	452
Cattle—Sheep—Horses,	452
Hogs—Game—Fish,	453

BOOK CII.

EUROPE CONTINUED.

Hungary and the adjacent Provinces. Towns, Divisions, &c.

Central Towns—Buda—Pesth,	454
Plain of Rokasch,	454
Towns in the North-west—Presburg, Royal Hill—Island of Schutt,	454
Towns in the Country of the Mines—Manners of the Miners —Caverns,	455
Different Natural Curiosities—The Sixteen Free Towns, in the County of Zips—Manners of the German Colony,	455
The See of the Ten Lancers—Northern Towns,	455
Caverns in the County of Torna,	455
Country of Vineyards—Towns—Towns in the North-east,	456
Different Nations in Northern Hungary—Slovacks—Their Increase,	456
Kopaniczars—Character of the Slovacks—Their Costume— Dialect of the Slovacks—Their Numbers,	456
Rusniacs—Manners and Customs—Marriages, &c.—Szo-taks,	457
Towns in the Plain—Debreczin,	457
Towns in the Bannat of Temeswar—Cavern of Veterani— Hungarian Walachians—Their Bigotry,	457
Funerals,	458
Superstitions—Remarks,	458
Walachian Fraternity—Towns between the Danube and the Theiss,	458
District of the Tchaikistes—Great and Little Cumania,	459
Cumans—Language—Origin—Iazygia—Haydeckes,	459
Trans-Danubian Circle—Towns and Remarkable Places,	459
Towns continued—German Inhabitants,	460
Vandals—Croatia and Slavonia—Physical Regions—Valleys without outlet, Caverns—The Borra,	460
Productions—Slavonia—Productions—Agriculture,	461
Population—The Croatians—Zupania,	461
Character—Manners,	462
Towns of Croatia—Coast of Croatia,	462
Caroline Way—The Zbiztri—Josephine Way,	462
District of Turopolia—Towns in Slavonia—In Symria—King- dom of Dalmatia—Dalmatia Proper—Towns,	463
Islands of Dalmatia—Trade and Manufactures—Fishes— The Morlachians,	463
District of Poglitza—Ragusa—Territory of Ragusa,	464
Towns—Ragusan Islands—Bocche di Cattaro,	464
Towns and Districts,	464
Manners of the Bocchesi—Transylvania—Name,	465
Divisions—Country of the Saxons—Towns,	465

Kronstadt—Foundation of the Saxon Colony,	465
Constitution—Manners—Name,	465, 466
Country of the Szecklers—Country of the Hungarians—Towns,	466
Name of the Carpathian Mountains,	466

BOOK CIII.

EUROPE CONTINUED.

Hungary concluded.—Researches on the Origin of the Hungarians. —General Remarks on Hungary, and the Provinces annexed to it.

Hungarians—Seat of the Nation,	467
Physical Character—Nobles—National Character,	467

BOOK LIX.

AFRICA.

A General View of this Division of the World and its Inhabitants.

BEGINNING with the west of Asia, the ancient cradle of history, we have gone over the whole of that great continent to its eastern limits, which were unknown to the ancients. We then embarked on the Great Ocean, and visited the numerous and interesting islands of Oceanica, a part of the world entirely new, and which might be viewed as an immense archipelago annexed to Asia. Fronting Oceanica on the west, a vast peninsula goes off from the body of the Asiatic Continent. This peninsula forms likewise one of the great divisions of the world, and one which is particularly well characterized. AFRICA, on the description of which we are now to enter, will not present to us a new and unlooked for territory, where the European traveller, falling in with a numerous succession of feeble savage tribes, gives to his discoveries names borrowed from the recollections of his native country. Africa, the shores of which our ships have been for three centuries in the habit of coasting, has been known to history for 3000 years. Yet notwithstanding its ancient celebrity, and notwithstanding its vicinity to Europe, it still in a great measure eludes the examination of science. It was from the African shores that the Egyptian colonies, in the most remote times, brought to savage Europe the first germs of civilization. At the present day, Africa is the last portion of the old world to receive from the hands of the Europeans the salutary yoke of legislation and of culture.

If Africa has remained so long inaccessible to the ambition of conquerors, to commercial enterprize, and to the curiosity of travellers, we shall find in its physical form the principal cause of its obscurity. A vast peninsula, 5000 miles in length, and nearly 4600 in breadth,^a presents, in an area of nearly 13,430,000 square miles,^b few long or easily navigated rivers. Its harbours and roadsteads seldom afford a safe retreat for vessels, and no gulf or inland sea opens the way to the interior of this mass of countries. The Mediterranean on the north, by which it is separated from Europe, and the Atlantic and the Ethiopic Oceans, which encompass it on the west, form inconsiderable ine-

qualities in the line of coast to which the name of gulfs is improperly given, viz. the Gulf of Guinea in the south, and that of the Syrtes in the north, both held in dread by navigators. The breadth of the continent, between the bottoms of these gulfs, is still 1800 miles.^c The coasts of Senegal and Guinea, indeed, present several mouths of rivers accompanied with islands; and were it not for the barbarous character of the people, these would be the most accessible parts of Africa. To the south, however, the continent resumes its usual appearance, and terminates in a mass of land without any deep windings. To the east a number of islands, and some mouths of rivers, seem to promise a readier access. The coast washed by the Indian Ocean lies low, like the opposite shores of Guinea, but we find only a short way in the interior the formidable terrace of arid mountains which forms the eastern extremity of the continent. In the north-east the Arabian Gulf separates Africa from Asia, without breaking the gloomy uniformity of the African coast.

This large continent has its outline marked by four great promontories. Cape Serra in the north projects into the Mediterranean. Cape de Verde points due west into the Atlantic Ocean. Cape Guardafui receives the first rays of the rising sun. The Cape of Good Hope makes a long excursion into the southern hemisphere. On three other remarkable points Africa comes close up to the rest of the old continent. In the north-west the narrow Strait of Gibraltar divides it from Europe. In the east Arabia is separated from it by the Strait of Bab-el-mandeb. In the north-east the low sandy Isthmus of Suez connects it with Asia.

In some parts excessively parched, in others marshy or flooded, the soil of Africa presents strange contrasts. At great mutual distances are some large and beneficent rivers, as the Nile in the north-east, the Senegal and Gambia in the west, the Zaire in the south-west, the Cuama on the eastern coast; and, in the centre, the mysterious Niger, which conceals its termination as the Nile used to conceal its origin.^d More frequently we find small and short streams, such as all the rest, with the exception of ten or twelve.

truth, the most correct expression, as the principal source is as yet only matter of conjecture. The source, visited by Bruce, is only one of its subordinate branches.—P.

^a 1820 French leagues by 1650.

^b 1,750,000 sq. Fr. leagues.

^c 650 Fr. leagues.

^d In the original, "as the Nile conceals its source." This is, in

Almost all these rivers contain cataracts in their course, and present bars or sand banks at their mouths. In the interior, and even on the coast, there are great and lofty rocks, from which no torrents proceed; and table-lands watered by no streams, as the great desert of Zahara, and others of minor extent. Again, there are countries constantly impregnated with moisture, as those which contain the lake or marsh of Wangara, and the lake Maravi,^a and some temporary lakes occasioned by the rising of the rivers. These features constitute the hydrography of this part of the world.

When we attend to the structure of the mountains, other singularities come into view.^b Though Africa very probably has mountains high enough to be covered with perennial snow even under the equator, that is, 16,000 feet^c in elevation, it is, in general, to be remarked, that the African chains are more distinguished for their breadth than for their height. If they reach a great elevation, it is by a gradual rise, and in a succession of terraces. Perhaps we should not deviate far from truth, if we were to venture the assertion, that the whole body of the African mountains forms one great plateau, presenting toward each coast a succession of terraces.^d This nucleus of the African continent seems to contain few long and high ranges in the interior, so that if the sea were to rise three or four thousand feet above its present level, Africa, stript of all the low lands which line its shores, would appear almost a level island in the midst of the ocean.

None of the known chains of Africa are adverse to this view of its surface. Atlas, which lines nearly the whole of the north coast, is a series of five or six small chains, rising one behind another, and including many table lands. The "littoral chain of the Red Sea," or the Troglodytic Chain, resembles Atlas in its calcareous steeps,^e so imposing to the eye of the traveller, yet really of very moderate height. The Chain of Lupata, "or the Spine of the world," which seems to reach from Cape Guardafui to the Cape of Good Hope in a direction not well known, contains the plateaus of Adel and Mocaranga; it terminates in the south in high and barren plains, called the Karroos, and in steep mountains with flat summits, one of which has received the significant name of the Table Mountain. This chain seems then to resemble the preceding two. The rivers of Guinea descend in a series of cataracts, not in long and deep valleys. This is the usual character of calcareous mountains, formed into terraces, and such seems to be the nature of the Kong mountains.

There is just one fact which may be opposed to us with some appearance of reason. We are told that "a very high central chain crosses Africa from east to west, beginning at Cape Guardafui and ending about Cape Sierra Leone; comprehending the Kong mountains, and the Mountains of the Moon, which lie to the south of Abyss-

nia. But the extension thus given by Major Rennel to the Mountains of the Moon, would not be inconsistent with the views now given. Africa would still be a plateau consisting of terraces; the plateau would only be cut in two by a sort of wall. But we do not, by any means, admit the existence of that high central chain. It is true that the nucleus of mountains which gives origin to the Senegal, the Gambia, the Mesurada, and the Joliba or Niger, gives off, among other branches, one which has an easterly direction, and which partly separates the basin of the Niger from the coast of Guinea. This is the chain called the Mountains of Kong, on the southern declivities of which rise the Rio-Volta and some other rivers of Guinea.^f But the learned Rennel has stretched his conjectures too far, in pretending to connect this chain to that of the Mountains of the Moon on the south of Abyssinia. May not these mountains be lost in the central plateau of south-eastern Africa? or, if they are extended to the west, may they not terminate about Cape Lopez-Gonsalvo, opposite to St. Thomas's Island? The following facts render this supposition very probable.

At Darfoor, the south winds are the hottest and driest, and bring along with them clouds of dust. This shows that there is no high chain of mountains immediately to the south of Darfoor. The Mountains of the Moon must be removed farther to the south and to the east, and the south winds of Darfoor must sweep over a sandy, though, perhaps, somewhat elevated plain.^g

The passages of Ptolemy and Leo Africanus, which seem to describe a central chain, prove nothing. The first of these authors mentions several detached mountains without saying any thing of their extent. Leo says that the inhabitants of Wangara cross very high mountains when they go in search of gold dust.^h But the position of these mountains is not defined any more than the country of Zegzeg, the inhabitants of which require large fires to protect them from the cold.ⁱ Even Major Rennel thinks that the mountains last referred to must lie to the north of the Niger.

The prodigious numbers of slaves which come to Benin show that there is an open and easy communication with the interior. The slaves of the Ibbo nation perform a journey of seven months through forests and morasses.¹ It is even probable that, in the sixteenth century, the king of Benin was subject to the king of Ghana, a city situated on the Niger,^m a circumstance which implies easy inland communications. Is it not also probable that the Niger, or some other river from the interior, flows into the most easterly corner of the Gulf of Guinea? Such large gulfs as this have generally some great river falling into their further extremity. The rivers which traverse Benin and Calabar seem to be arms of some great river. We are indeed told, that this appearance of great size is confined

^a "Which are supposed to contain." These lakes belong to the conjectural geography of Africa. That of Wangara is located in the countries visited by Denham and Clapperton, and is perhaps the Tsad.—P.

^b See the views of the celebrated M. Lacepede, in the *Annales du Muséum d'Hist. Nat.* vol. vi. p. 284.

^c At least 15,577 feet.—P.

^d "Which, on all sides, presents continuous terraces," *i. e.* each terrace traces an uninterrupted line, or nearly so, around the entire plateau.—P.

^e "Falaisea," bluffs.

^f Besides the mountains of Kong, which form the S. boundary of the basin of the upper Niger, there is another range which sweeps round the sources of the Gambia and Senegal to the N. E. and W. of N. and

which forms the N. W. boundary of the same basin. It is probable the source of the Niger is not far in the interior from the coast of Sierra Leone.—P.

^g "A sandy plateau."

^h Immediately to the south of Bornou is a range of primitive mountains, extending E. and W.; and the country between Bornou and Soudan, and which probably separates the basin of the Tsad from that of the Niger, is also primitive.—P.

ⁱ Leo Africanus, p. 329, de la traduction de Jean Temporal.

^k In crossing from Bornou to Soudan, Lieut. Clapperton suffered considerably from the cold, and a thin film of ice was formed in his water-bags.—P.

^l Oldendorp. See our Account of Guinea, in the sequel.

^m Barros, Dec. I. liv. 3. ch. 4.

to the low lands immediately on the shore, but we have hitherto no accounts from any traveller who has actually ascended them, and the hypothesis has been advanced and plausibly supported, that the Niger terminates here.

The principle which we have now defended is susceptible of some interesting applications. If Africa is one immense flat mountain, rising on all its sides by steps or terraces, we easily conceive that it will not give origin to such narrow pointed peninsulas, or such long chains of islands, as those by which other continents are terminated. These peninsulas and chains of islands are submarine prolongations of the mountain chains extended across the continents.^a In Africa nothing similar appears, excepting the Canary islands.^b The mountains lying parallel to the coast have scarcely any submarine continuation. A sea, clear of islands, washes a coast marked by an even, unnotched line. The great island of Madagascar, on the east, is not a prolongation of the continent, but follows a direction parallel to that of the coast.

If we turn our attention to the interior of Africa, the same principle makes its appearance in the vast plains which occupy the greater part of its extent. Some covered with sand and gravel, with a mixture of sea shells, and incrustated with saline crystallizations, look like the basins of evaporated seas. Such is the famous desert of Zahara, where the sands, moving like the waves of the ocean, are said to have sometimes swallowed up entire tribes. Others, of a marshy nature, and filled with stagnant lakes, emit effluvia the most destructive to human life, or breed disgusting reptiles, and formidable animals of huge size. Neither in the one nor the other do rivers find descent or outlet. They either terminate in lakes, or are lost in the sands. Many of the smaller streams never unite to form permanent currents, but disappear with the rainy season, to which they owe their origin. Africa contains an infinite number of these torrents and rivers which never reach the sea. Some of them have a long course, and rival the greatest rivers in the world. Such is the Niger or Joliba, unless it has an outlet, as yet unknown, in the Gulf of Guinea. After it come the river of Bornoo and the Kullah; the Misselad in Nigritia; and the Djedyd, in the Zab country, belonging to the Algerine states. Many of these rivers must form lakes or small inland seas, probably equalling the sea of Aral.^c The heat which rapidly dries up the waters, the bibulous quality of the soil which absorbs them, and, still more, the absence of great inequalities, or extensive hollows, prevents the African table land from possessing another Caspian Sea.

Lake Maravi gives some reason to suppose that there may be a second Niger in the interior of eastern Africa. The other rivers of this continent, such as the Senegal, the Gambia, the Zaire, and the Orange river on the western coast, the Zambezi, or Cuama, and the Makadshec on the eastern coast, and lastly the Nile, which surpasses the others, and which is the only one that runs north into the Mediterranean, all possess a character of resemblance depending partly on the climate of the torrid zone, and partly on the structure of the plateaus in the heart of Africa. This resemblance consists in the periodic swells, by which these rivers overflow the countries through which they pass, and particu-

larly those by which their mouths are surrounded. These risings differ in nothing from the floods of our European streams, except in their regular annual return, in the large volume of water which they bring along with them, and the great quantity of mud which they deposit. It is well known that the rainy season, which, over the whole torrid zone, is synchronous with the vertical position of the sun, brings on almost continual drenching rains. The heavens, formerly burning like a flame, are transformed into a great atmospheric ocean. The copious waters which they pour down collect on the table lands of the interior, where they form immense sheets of water, or temporary lakes. When these lakes have reached a level high enough to overflow the boundaries of their basins, they suddenly send down into the rivers, previously much swollen, an enormous volume of water, impregnated with the soft earth over which it has for some time stagnated. Hence the momentary pauses and sudden renewals in the rise of the Nile. Hence the abundance of fertilizing slime, which would not be found so copious in the waters of rivers which owed their rise solely to the direct influence of the rains. These phenomena, simple in their origin, only astonish persons who have observed the effects without tracing their cause.

The general climate of Africa is that of the torrid zone; more than three fourths of this continent, (ten thirteenths at least) being situated betwixt the tropics. The great mass of heated air, incumbent on these hot regions, has ready access to its northern and southern parts situated in the zones called temperate, so that the portions of them adjoining the tropics are equally torrid with the regions actually intertropical.^d Nothing really moderates the heat and dryness of the African climate, except the annual rains, the sea breezes, and the elevation of the surface. These three circumstances are sometimes united in a greater degree under the equator than in the temperate zones. Such parts of the interior of Guinea, Nigritia, or Abyssinia, as fall under this description, enjoy a temperature much less scorching and dry than the sandy deserts on the south of Mount Atlas, though the last are thirty degrees from the equator. It is not impossible that in the centre of Africa there may be lofty table-lands like that of Quito, or valleys like the valley of Cashmere, where, as in those two happy regions, spring holds an eternal reign.

There is another general cause which influences the climate of Africa less than might be expected. The greatest cold of the southern hemisphere is felt only on the southern shores, and is confined to a very small portion of the year. The saline and arid character of the lands of the southern extremity resembles, in some measure, that of the coasts of Zahara and of Ajan.

Nowhere do the empire of fertility and that of barrenness come into closer contact than in Africa. Some of its countries owe there fertility to high wooded mountains moderating the heat and dryness of the atmosphere. More frequently the fertile lands, bounded by vast deserts, form narrow stripes along the banks of the rivers, or alluvial plains situated at their mouths. These latter, generally contained between two branches of the river diverging to form a triangle, have, from their figure, received the name of Delta, from the fourth letter of the Greek alpha-

^a Not the peninsulas: though these may be the commencement of such prolongations.—P.

^b Which may be a continuation of the chain of Mount Atlas.—P.

^c Such is the Tsad in Bornou.

^d In the original simply, "situated nominally in the temperate zones;" thus inferring that the climate is really that of the torrid zone.—P.

bet, which is a triangle. The term has been, by way of eminence, given to the flat island formed by the Nile in Lower Egypt. Another class of fertile lands owe their existence to springs, which here and there burst forth in the midst of deserts. These spots of verdure are called *Oases*. Even Strabo mentions them, when he says, "To the south of Atlas lies a vast desert of sand and stones, which, like the spotted skin of a panther, is here and there diversified by *oases*; that is to say, by fertile grounds, rising like islands in the midst of the ocean."

It is to these contrasts that Africa owes its twofold reputation. This land of perpetual thirst, this arid nursery of lions,^a as it was called by the ancients, was, at the same time, represented under the emblem of a woman crowned with ears of corn, or holding ears of corn in her hand.^b Although the character of high fertility belongs especially to the *Africa propria* of the ancients, that is, the present state of Tunis, it is certain that in this part of the world, wherever moisture is conjoined with heat, vegetation displays great vigour and magnificence. The human species find abundant aliment at a very insignificant expense of labour. The corn stalks bend under their load; the vine attains a colossal size; melons and pumpkins acquire enormous volume; millet and holcus, the grain which is most common over three fourths of this continent, though badly cultivated, yield a return of one or two hundred fold; and the date tree, which is to the African what the cocoa nut and the bread fruit are in Oceanica, can withstand the fiery winds which assail it from the neighbouring deserts. The forests of Mount Atlas are equal to the finest of Italy and Spain. Those of the Cape boast of the silver leaved *Protea*, the tree heath, and other elegant trees. In the whole of Guinea, Senegambia, Congo, Nigritia, and the eastern coast, formerly denominated India, are to be found the same thick forests as in America. But in the parts which are marshy or arid, sandy or rocky, that is, in one half of Africa, the natural vegetation presents a harsh and uncouth physiognomy. Scattered tufts of saline plants diversify a plain which has no green sod to clothe its nakedness; thorny shrubs, *Mimosas*, and *Acacias*, present impenetrable thickets. *Euphorbiae*, *Cacti*, and arums, fire the eye with their stiff and pointed forms. The enormous baobab, and the shapeless dragon tree, are void of grace and majesty. The fruit of the theobroma, finding its way outward through the bark of the trunk, a bark of a blackened and scorched appearance, seems affected by the same power of solar heat which has impressed the most sombre hues on the skin of the negro.

The animal kingdom presents still greater variety, and more originality. Africa possesses most of the animals of the old continent, and in some species possesses the most vigorous and the most beautiful varieties. Such are the horse of Barbary, the Cape buffalo, the Senegal mule, and the zebra, the pride of the asinine race. The African lion is the only lion worthy of the name. The elephant and the rhinoceros, though of less colossal dimensions than those of Asia, have more agility, and perhaps more ferocity; yet the African elephant is said to fly at the sight of that of Asia. Several very singular animal forms appear to be

peculiar to this part of the world. The unwieldy hippopotamus inhabits the south, from the Cape of Good Hope, to Egypt, and the Senegal. The majestic giraffe, the prototype of the *Seraphim* which the Arabian mythology yoked to the chariot of the lord of thunder, roams from the Niger to the Orange River. The gazelle, or antelope genus, peoples Africa with numerous species and varieties, some lighter and handsomer than others, and perhaps all different from those of the table-land of Asia. Following the same principle, Africa, filled with monstrous apes^c and disgusting baboons, is probably deficient in many species of monkeys which seem reserved for Oceanica, as the orang-outang;^d or for America, as the sapajous. The winged race of Africa is equally peculiar. The flamingo, in his scarlet robe, the parrot, clad in emerald and sapphire hues, the egret, of elegant plumage, might have imparted sufficient interest to the descriptive pen of Vaillant, though he had added no imaginary birds. The ostrich is peculiar to Africa, as the cassowary is to Oceanica, and the rhea, or touyou, to South America; but, among the walking birds, which have no true wings,^e that of Africa is the largest and most perfect. We reserve for our special delineations other researches, which will confirm the old adage, "that Africa was always furnishing natural history with some new animal;"—researches which will give a probability to the existence of some extraordinary animals, celebrated in all the writings of antiquity, while modern criticism, perhaps too sceptical, has assigned them a place among the creations of fable.

The inconveniences and calamities occasioned by venomous or voracious reptiles, are not peculiar to Africa; the whole torrid zone has its serpents, its scorpions, its crocodiles, or other equivalent species. But nowhere else, except in New Holland, do the *termites* build so many destructive nests. The swarms of locusts of Asia are much less thick and extensive than those of Africa, where whole tribes of men use them as food.

To conclude our picture, we find the human species in this part of the world exhibited in a new light. The Africans seem to form three races which have long been distinct. The Moors are a handsome race, resembling in stature, physiognomy, and hair, the best formed nations of Europe and Western Asia, though darkened by the influence of climate. To this race belong the Berbers or Kabyls, and the other remains of the ancient Numidians and Gætuli. They bear a great similarity to the Arabians, from whom they received in the seventh century numerous colonies. The Copts, Nubians, and Abyssinians, cannot well be considered as originally a distinct race, being probably sprung from a very ancient mixture of Asiatic and African nations. The second race is that of the Negroes, whose general characteristics are universally known. It occupies all the centre, and all the west from Senegal to Cape Negro, and has found its way into Nubia and Egypt. The third race is that of the Caffres, which occupies all the eastern coast, distinguished from the negroes by a less obtuse facial angle, a convex forehead, and a high nose; but approaching them in their thick lips, their curled and almost woolly hair, and a

complexion varying from a yellow brown to a shining black.

Besides these great races, Africa contains some tribes of a character quite peculiar, which they derive either from some unknown original, or from the influence of climate. The Hottentots are the most conspicuous example, but we shall find some others in the course of our particular details.

The languages of Africa must, according to M. de Seetzen, amount to 100 or 150. They differ from one another in a most striking manner, and have so few features of mutual resemblance, that the attempts made to classify them have proved fruitless. The Berber language has indeed been traced from Morocco to Egypt. The three negro languages of Mandingo on the upper Senegal, of Amina on the Gold coast, of Congo on the Congo coast, seem to be extensively diffused; and the same may be said of the Betjouana Caffre. But the general character of Africa in this respect is still that of a multitude of confined idioms which seem to comprehend many sounds scarcely articulate, some that are very strange, sometimes howlings, sometimes hisses, contrived in imitation of the cries of animals, or intended as watchwords to distinguish hostile tribes from one another. This fact perplexes those who consider the unity of the human race as a demonstrable historic truth; but it appears to us that in Africa and every where else, true history, going back to the most remote times, finds the human species, like the plants and animals, disseminated over the surface of the globe, and divided into numberless small tribes or families, each speaking a peculiar idiom, imperfect and often singularly distorted. The artificial combination of these primitive jargons has given origin to the regular languages which probably began with the formation of cities.

Civilization, which has furnished man with abstract and general ideas, has followed in Africa a singular progress, dictated by the climate and by the character of the most numerous indigenous race. This progress may be distributed into the following epochs.

Living in abundance, but separated from one another by deserts; surrounded by copious and excellent food of spontaneous growth, but encountering prodigious obstacles in all their attempts at artificial culture; enjoying a climate which required no clothing to protect them from cold, and only needing a cover to shelter them from rain, the Negro (called the Ethiopian by the ancients,) and probably also the Caffre or Troglodyte, never felt that stimulus of necessity which creates industry and reflection. Enjoying a wild happiness of condition, they satisfied the demands of sense, and scarcely possessed any notion of an intellectual world. But they felt the presence of an invisible power. They looked for its residence in the tree which gave them food, in the rock which shaded them, in the serpent which they dreaded, and even in the monkeys and parrots which sported around them. Some believed that a piece of wood, or a fragment of stone, was the seat of a supernatural power: they were delighted to think that their deities could be carried along with them in all their motions. This system, which is called *fetichism*, and which is the rudest form of *pantheism*, seems common to every climate and to every race: but it prevailed to the exclusion of every other in Africa, and especially among the negroes.^a These superstitions were merely ridiculous.

Vengeance and brutality, however, gave birth to others of a horrible and atrocious nature. The prisoner of war from an adjoining tribe was sacrificed on the tombs of those against whom he had fought. Believing in the necessary connection between moral powers and visible objects, these barbarians were persuaded that by devouring the bodies of their enemies, they became imbued with the courage of the deceased. Cannibalism, arising from the rites of the hideous altar, and at first limited to these rites, was soon converted into a capricious taste—a demand of luxurious appetite. Vanquished tribes thought themselves fortunate in being reduced to slavery, instead of being devoured; but their masters sold their persons like cattle. In the meantime, the Berbers or Moors, proud of a little superiority over these degraded beings, hunted them down like wild beasts, and wrought them like domestic animals. Such may be considered as the primitive state of the Africans, and it still in some measure subsists.

Afterwards came some beneficent impostors, who altered the face of things. Several dynasties of royal high priests^b erected temples at Meroë, at Thebes, and at Memphis, which became the asylum of peace, the focus of the arts, and the resort of trade. The savage, attracted by curiosity, and enslaved by superstition, bowed down before the statue of a god with a dog's head, or the beak of a bird, emblems which formed improvements on his rude *fetiche*. At the command of the servants of the gods, a multitude which scarcely possessed cabins of palm trunks for themselves, cut the granite into columns, carved hieroglyphics on the porphyry, and by persevering labour completed monuments which have stood undecayed for ages. Nor were works of utility neglected. The sacred water of the Nile, confined by dykes, and distributed by canals, fertilized the plains which had previously been overrun with reeds and rushes. Caravans, protected by the name of the deities, ascended the Nile, and penetrated to the remotest valleys of Ethiopia, collecting gold and ivory, and spreading every where the germs of new religions, new laws, and new manners.

At Memphis, Thebes, and Meroë, the caste of warriors rebelled against the pontiffs. The gentle illusions of theocracy were succeeded by revolutions, wars, and agitations, at the despotic court of the Pharaohs. Notwithstanding events of this kind, Egypt long continued a great and flourishing empire, but was less fortunate as to any influence on the civilization of the rest of Africa.

Carthage had founded another empire in the west. Her hardy sailors, and her enterprising merchants, reached as far as Cape Blanco by sea, and her inland travellers reached the Niger by land; but the only means which they possessed for subjugating nations were their armed force, and the attractions of certain articles of commerce. Intimately connected with the Berber or Moorish people, whose talents for war they brought into activity by raising among them light troops for their own service, they exercised only an indirect influence on the Ethiopians or the negroes. This race of men, left to themselves, confined their exertions to gathering from the earth simple aliments of easy culture. The government of petty despotic patriarchs gave place to more extended monarchies. In the mysterious associations of Guinea, the spirit of the priests of Meroë was seen to revive. The most essential change which the civil constitution of Africa underwent, was the distinction established between free-men and slaves. That dis

^a See afterwards our account of Nigritia.

^b "Pontifes-rois," Pontiff-kings.

tion existed among the Greeks and the Romans with features equally odious and inhuman as in Africa. But, while Christianity abolished it in Europe, in Africa it has been perpetuated.

Beyond the limits of their own empire, the Romans had no direct relations with any people except the inhabitants of Fezzan and of Nubia, and, at a very late period, with Abyssinia, or the kingdom of Axum. Nor did Christianity succeed in shedding her light on the west, the centre, and the south of Africa. Her benefits, which were spread over the north, disappeared under the effects of disastrous wars. To Mahometanism was reserved the task of effecting a change in African civilization. The fanatic Arab, mounted on the active dromedary, or embarked in light vessels, flew to plant the standard of his prophet on the banks of the Senegal, and on the shores of Sofala. Never did a people possess a union of qualities better adapted for conquering and preserving the empire of Africa. Among the Mauritians and Numidians they found brothers and natural friends; an identity of manners, food, and climate. The fanatic mussulman spirit astonished and subdued the ardent imaginations of the Africans; the simplicity of the creed suited their limited intellect, and easily connected itself with the superstitions of fetichism, and the ideas which these people entertained of magic and enchantments. Africa, and especially the *Oases* of the Great Desert, soon furnished the new religion with its most zealous defenders. Civil slavery and despotic government suffered no change, except that the *Marabouts*, or Mussulman priests, and the *Sherifs*, or descendants of the prophet, formed, in some of the states, a species of aristocracy. Cannibalism alone was of course abolished, and that was a real benefit which humanity received at the hand of Islamism.^a One event favoured, for a moment, the civilization of the Moors. The expulsion of those of their number who had ruled in Spain peopled Barbary, and even the *Oases* of the great desert, with a more industrious and better informed race than the rest of the Mahometans. But, unhappily for Africa, a handful of Turkish adventurers, vying with one another in ferocity and ignorance, established themselves on the coast of Barbary, subdued the Moors, and founded the barbarous governments of Algiers, Tunis, and Tripoli, forming a deadly barrier, more efficient than Mahometanism itself, in separating Africa from the civilized world.

^b See the interesting work of M. Grégoire, formerly Bishop of Blois, on the Literature of the Negroes.

^c The author, in the original, expresses an opinion that, from the

The voyages of the Portuguese, and the slave trade, subsequently opened new communications between Africa and the west of Europe. These countries were found, as they still are, distracted by perpetual war, a war so much the more deplorable, because, being confined to a system of cruel robbery, without the spirit of territorial conquest, it does not give birth to those great empires which sometimes admit a species of civilization. A lengthened observation of the character of the Africans has made us acquainted with their virtues, their docile dispositions, and their versatility in imitating our arts. Sufficient proof is obtained that there is nothing in their moral nature which condemns them to perpetual barbarism.^b Europe, occupied with the East and West Indies, has paid comparatively little attention to a country nearer home, and perhaps more wealthy than those others. Hence our relations with the African coasts have been long confined to that traffic in human beings which is reprobated both by religion and philosophy, and only justified by a fallacious reference to adventitious circumstances, from which this traffic appears to operate as a corrective of greater disorders and inhumanity. These circumstances are many of them the creation of this infamous traffic itself, which debases and brutalizes the miserable natives, as has been amply proved by a comparison between the state of the same countries before and since the late partial abolition, and under the temporary revivals of the same disgraceful inhumanity to which individual avarice has, in some places, given rise. That the utter abolition of the slave trade will ever be the cause of the revival of cannibalism and human sacrifices, as some have ventured to predict,^c is impossible. Moral practices, as well as physical population, do not, in Africa, depend on causes different from those which regulate them in France or England. The introduction of knowledge and enlightened habits is the great engine by which we hope to see Africa made to hold a respectable rank in the scale of human society. The colonies established on its shores, and the efforts made to open a legitimate and beneficial trade between Africa and the civilized world, will, it is hoped, excite in the minds of its inhabitants a due esteem for regular laws and civilized manners, and induce them either to emulate them by efforts of their own, or to submit to receive from others these benefits in exchange for the miseries of a wretched independence.

great increase in the number of prisoners, in consequence of the abolition of the slave trade, it would, perhaps, be followed by the horrible massacres and human sacrifices which still prevail in the interior. Such a waste of life has been noticed in Ashantee; but nothing of the kind was observed in the countries visited by Denham and Clapperton. P

BOOK LX.

EGYPT.

PART I.

A Physical Description of this Country.

EGYPT is the connecting link between Africa and the civilized world. This country, unique in its nature and in its historical records, deserves a more minute description than the other countries of Africa. Egypt consists entirely of a valley, watered by the Nile, by which it has in part been formed; and confined, on the right and left, by a barren expanse of deserts. The physical picture of this country, therefore, will be introduced, with an account of the Nile, whose bounties render Egypt independent of all foreign supplies, and even of the rains of heaven.

The Nile, the largest river of the old world, still conceals its true sources from the research of science. At least, scarcely any thing more of them is known to us now than was known in the time of Eratosthenes. That learned librarian of Alexandria distinguished three principal branches of the Nile. The most easterly is the Tacazzé of the moderns, which flows down the north side of the table-land of Abyssinia. The second known branch, or the Blue River, first makes a circuit on the table-land of Abyssinia, and then flows down through the plains of Sennaar, or of Fungi. The sources of this Blue River were found and described by the Jesuits, Pæz and Tellez, two centuries before the pretended discovery of Bruce. These two rivers are tributaries to the White River, the Bahr-el-Abiad, which is the true Nile, and the sources of which must lie in the countries to the south of Darfoor. These countries are, according to the report of a Negro, named *Dar-el-Abiad*. The mountains from which it issues are called Dyre and Tegla; and probably form part of the Al-Qamar^a mountains, or the mountains of the Moon. As it seems proved that travellers have passed by water from Tombuctoo to Cairo, either the Niger must fall into the Nile, if it be not really the Nile itself; or there must be intermediate rivers, forming between the Nile and Niger a communication resembling that which was found by Humboldt, between the Orinoco and the Amazons. The first hypothesis might seem to be supported by a vague romantic passage of Pliny the naturalist, quoted in our History of Geography.^b The other hypothesis is the only one which can reconcile the accounts of persons who have travelled by this route from Tombuctoo, with the positive testimony of Mr. Browne, according to which the rivers Misselad, and Bar-Kullah, run from south to north. This fact, which is generally admitted, does not allow us to suppose any other communication between the Nile and the Niger, than one formed by canals which, like the Casiqui-

ari in Guiana, may wind along a table-land where the sources of the Misselad and Bar-Kullah are at a short distance from each other, and from those of the Nile. Perhaps some of our readers will content themselves with supposing that the sources of all these rivers are sufficiently near to communicate by means of temporary lakes during the rainy season.

The true Nile, whatever may be its origin, receives two large rivers from Abyssinia, and then forms an extensive circuit in the country of Dongola by turning to the southwest. At three different places a barrier of mountains threatens to interrupt its course, and at each place the barrier is surmounted. The second cataract, in Turkish Nubia, is the most violent, and most unnavigable. The third is at Syene, or Assooan, and introduces the Nile into Upper Egypt. The height of this cataract, singularly exaggerated by some travellers, varies according to the season, and is generally about four or five feet.

From Syene to Cairo, the river flows along a valley about eight miles^c broad, between two mountain ridges, one of which extends to the Red Sea, and the other terminates in the deserts of ancient Libya. The river occupies the middle of the valley, as far as the defile called Gibel-Silsili. In this space of about forty miles^d long, it has very little arable land on its banks. It contains some islands which from their low level easily admit of irrigation.

Below the defile of Gibel-Silsili,^e the Nile runs along the right side of the valley, which in several places has the appearance of a line of rock cut perpendicularly, while the ridge of the hills on the left side is nearly always accessible by a slope of various acclivity. These latter mountains begin, near the town of Sioot, to diverge gradually to the west, in a direction towards Faïoom,^f so that between them and the cultivated valley there is a desert space, becoming gradually wider, and which in several places is bordered on the valley side by a line of sandy downs lying nearly south and north.

The mountains which confine the basin of the Nile in Upper Egypt are intersected by defiles which on one side lead to the shores of the Red Sea, and on the other to the *Oâses*. These narrow passes might be habitable, since the winter rains maintain for a time a degree of vegetation, and form springs which the Arabs use for themselves and their flocks.

The stripe of desert land which generally extends along each side of the valley, parallel to the course of the Nile,

^f "Fayoum," Feium.

(and which must not be confounded with the barren ocean of sand which lies on each side of Egypt,) now contains two very distinct kinds of soil; the one immediately at the bottom of the mountain, consists of sand and rolled pebbles; the other, composed of light drifting sand, covers an extent of ground formerly arable. If a section of the valley is made by a plane perpendicular to its direction, the surface will be observed to decline from the margins of the river to the bottom of the hills, a circumstance also remarked on the banks of the Mississippi, the Po, part of the Borysthenes, and some other rivers.

Near Beni-sooef,^a the valley of the Nile, already much widened on the west, has on that side an opening through which a view is obtained of the fertile plains of Faïoom. These plains form properly a sort of table-land, separated from the surrounding mountains on the north and west by a wide valley, of which a certain portion, always laid under water, forms what the inhabitants call *Birket-él-Kârun*.

Near Cairo, the chains which limit the valley of the Nile diverge on both sides. The one, under the name of Gibel-al-Nairon, runs north-west towards the Mediterranean: the other, called Gibel-al-Attaka, runs straight east to Suez.

In front of these chains a vast plain extends, composed of sands covered with the mud of the Nile. At the place called Batu-el-Bakara, the river divides into two branches; the one of which flowing to Rosetta, and the other to Damietta, contain between them the present Delta; but this triangular piece of insulated land was in former times larger, being bounded on the east by the Pelusian branch, which is now choked up with sand or converted into marshy pools. On the west it was bounded by the Canopic branch, which is now partly confounded with the canal of Alexandria, and partly lost in lake Etko. But the correspondence of the level of the surface with that of the present Delta, and its depression as compared with that of the adjoining desert, together with its greater verdure and fertility, still mark the limits of the ancient Delta, although irregular encroachments are made by shifting banks of drifting sand, which are at present on the increase.

The different *bogaz*,^b or mouths of this great river, have often changed their position, and are still changing it; a circumstance which has occasioned long discussions among geographers. The following are the most established results. The seven mouths of the Nile, known to the ancients, were, 1. the *Canopic* mouth, corresponding to the present mouth of lake Etko; or according to others, that of the lake of Aboukir, or Maadée;^c but it is probable, that at one time it had communications with the sea at both of these places. In that case it is probable that these lakes existed nearly in their present state, except that the Nile flowed through them, and gave them a large proportion of fresh water, instead of the sea water with which they are now filled. We cannot believe that the bottoms of these lakes were formerly higher, as we know of no natural pro-

cess by which surfaces of such breadth could have been subsequently excavated. 2. The *Bolbitine* mouth at Rosetta. 3. The *Sebenitic* mouth, probably the opening into the present lake Bourlos.^d 4. The *Phatnitic*, or *Bucolic*, at Damietta. 5. The *Mendesian*, which is lost in lake Menzaleh, but its mouth is represented by that of Dibeh. 6. The *Tanitic*, or *Saitic*, which seems to leave traces of its termination towards the eastern extremity of lake Menzaleh, in that known by the modern appellation of Omm-Faredjeh. The branch of the Nile which conveyed its waters to the sea corresponds to the canal of Moez, which now loses itself in the lake. 7. The *Pelusiatic* mouth seems to be represented by what is now the most easterly mouth of lake Menzaleh, where the ruins of Pelusium are still visible.^e

The depth and rapidity of the Nile differ in different places, and at different seasons of the year. In its ordinary state, this river carries no vessels exceeding sixty tons burden, from its mouth to the cataracts. The bogaz of Damietta is seven or eight feet deep when the waters are low. That of Rosetta does not exceed four or five. When the waters are high, each of them has forty-one feet more, and caravels of twenty-four guns can sail up to Cairo.^f The navigation is facilitated in a singular degree during the floods: for, while the stream carries the vessels from the cataracts to the bogaz with great rapidity, the strong northerly winds allow them to ascend the river, by means of set sails, with equal rapidity. These winds are constant for nine months of the year, and, when the river is low, and the stream less rapid, vessels cannot often make their way downward even with their sails furled, the wind upward being more powerful than the stream, even under these circumstances. The regular practice at such times is, to row down with the stream during the night when the wind has subsided, and to halt somewhere during the day; while the vessels that are upward bound sail by day and halt by night. The passage from Cairo to the Mediterranean, occupies eight or ten days.^g When both voyages are practicable, it is an interesting sight to see the numerous boats passing one another on their way. The bogazes are difficult to navigate even during high Nile. Shifting sandbanks create unforeseen dangers in every part of the river. The cataracts are sometimes passed with the aid of a little address, combined with courage; the lowest cataract, in particular, being rather a rapid than a waterfall.^h

The celebrated plains of Egypt would not be the abode of perpetual fertility, were it not for the swellings of the river, which both impart to them the requisite moisture, and cover them with fertilizing mud. We now know for certain what the ancients obscurely concluded,ⁱ and what was asserted by Agatharchides, Diodorus, Abdollatif, and the Abyssinian envoy, Hadgi Michael,^k that the heavy annual rains between the tropics are the sole cause of these floods, common to all the rivers of the torrid zone, and which, in low situations, such as Egypt, occasion inundations.

^k Quoted by Wansleben in an unpublished account of a journey in Egypt. Collection de Paulus, I. 21.

The rise of the Nile commences with the summer solstice. The river attains its greatest height at the autumnal equinox, continues stationary for some days, then diminishes at a less rapid rate than it rose. At the winter solstice it is very low, but some water still remains in the large canals. At this period the lands are put under cultivation. The soil is covered with a fresh layer of slime of greater or less thickness.

The fertility and general prosperity of Egypt depend much on a certain medium in the height to which the Nile rises in its inundations; too little rise or too much is nearly equally hurtful. In September, 1818, M. Belzoni witnessed a deplorable scene, from the Nile having risen three feet and a half above the highest mark left by the former inundation.^a It was productive of one of the greatest calamities that had occurred in the memory of any one living. Rising with uncommon rapidity, it carried off several villages, and some hundreds of their inhabitants. Expecting an unusual rise, in consequence of the scarcity of water during the preceding season, the inhabitants had erected, as usual, fences of earth and reeds round their villages, to keep the water from their houses; but its force baffled their efforts, and the rapid stream carried before it men, women, children, cattle, and corn, in a moment. In Upper Egypt, the villages are not raised above the level even of the ordinary inundations, but depend for their safety on artificial fences. When a village is in danger, the boats are busily employed in removing the corn and the people, the former being first attended to, as more important to the Pasha; and, if the water breaks in before the inhabitants have been placed in security, their only resource is to climb the palm trees, and there wait till a boat comes to their rescue. Those who have it in their power repair with their property to a higher ground, others escape mounted on buffaloes or cows, or keep themselves afloat on logs of wood. Mr. Belzoni, in the course of his travels, came to the village of Agalta, between Luxor and Cairo, which he found four feet lower than the surface of the surrounding water; the caimakan, or guard, deploring his imminent danger of being swept away from a place in which honour and duty obliged him to remain. Some poor refugees were placed on spots of ground very little raised above the river, which had still twelve days to rise before reaching its utmost height, at which it remained stationary for other twelve.

The analysis of the mud of the Nile gives nearly one half of argillaceous earth, about one fourth of carbonate of lime, the remainder consisting of water, carbon, oxide of iron, and carbonate of magnesia.^b On the very banks of the Nile, the mud is mixed with much sand, which it loses in proportion as it is carried farther from the river, so that at a certain distance it consists almost of pure argil. This mud is employed in several arts in Egypt. It is formed into excellent bricks, and vessels of divers forms. It enters into the manufacture of tobacco pipes. Glass manufacturers employ it in the construction of their furnaces, and the country people cover their houses with it. This mud contains principles favourable to vegetation, and the cultivators consider it as sufficient manure.

The salubrity of the water of the Nile, so much extolled among the ancients, is acknowledged also by the moderns

under certain limitations. Being very light, it may deserve in this respect the character given of it by Maillet, that it is among other waters what Champagne is among wines. If Mahomet had tasted it, the Egyptians say, he would have supplicated heaven for a terrestrial immortality, to be enabled to enjoy it to eternity.^c It is said to be laxative, owing to certain neutral salts contained in it. But during the three summer months when it is in some places almost stagnant, it requires to be filtered, or otherwise clarified, before it can be used with safety. During the increase of the Nile, it first acquires a green colour, sometimes pretty deep. After thirty or forty days, this is succeeded by a brownish red. These changes are probably owing to the successive augmentations which it receives from different temporary lakes, or sheets of water, formed by the rains on the different table-lands of the interior of Africa.

The mountains on the west side of the Nile seem to consist of shell limestone. In those of the east side, serpentine and granite seem to form the highest ridges.

The stone of which the pyramid of Cheops, near Djizeh,^d is built, is a fine grained carbonate of lime, of a grayish white colour, and easily cut. The red granite, or rather syenite, of the ancient monuments, and which forms the coating of the pyramid called *Mycerinus*, is believed to be the *Pyropæcylon* of Pliny. In the neighbourhood of the Pyramids are found the Ethiopian jasper, the quartz rock with amphibole, and the Egyptian jasper, which is a quartz agate coarsely veined.^e From the ancient specimens preserved at Velletri, in Cardinal Borgia's museum, a Danish mineralogist, M. Wad, has published an essay on the fossils of Egypt. These specimens are, red granite, white granite, mixed with hornblende, (a character which distinguishes syenite from the proper granites,) green feldspar, and black hornblende. The porphyry seems to be formed of petrosilex, with crystals of feldspar. There is likewise found among them a small specimen of a dark brown micaceous schistus. The others are limestone, feldspar, breccia, serpentine, potstone, marble with veins of silvery mica, swinestone, jaspers of all varieties, the topaz or chrysolite of the ancients, amethyst, rock-crystal, chalcedony, onyx, heliotrope, obsidian, and lapis lazuli, but no emeralds. The greater part of the specimens are basalt, the Ethiopian stone of Herodotus and of Strabo.^f

The valley leading to Cosseir is covered with a sand partly calcareous, partly quartzose. The mountains are of limestone and sandstone. As we approach to Cosseir we find three sorts of mountains. The first consist of rocks of granite, of a small fine grain. The second chain comprehends rocks of breccia, or puddingstone, of a particular sort, known by the name of *breccia di verde*.^g To the mountains of breccia, for a space of thirty miles,^h a rock of a slaty texture succeeds, which seems to be of contemporaneous formation with the breccias, since it passes into them by gradual transitions, and contains rounded masses of the same substance.

Near the fountains of El-Aoosh-Lambageh, there rises a chain of schistose mountains, presenting in their composition petrosilex and steatitic rocks: but at a distance of eight milesⁱ from Cosseir the mountains suddenly change

their character; a great part of them are limestone, or gypsum, in strata almost always lying north and south. Here are found the fossile remains of the *ostrea diluviana*. Among these mountains of later formation, are found schists, and indistinct porphyries, with grains of feldspar. The bottom of the valley, covered with immense rocky fragments, presents a numberless variety of materials; sometimes serpentines, compound rocks in which actinote is the predominating ingredient, schists, gneiss, porphyries, and granites; sometimes a particular kind of steatite containing nodules of schistose spar. There is besides a new and peculiar substance in mineralogy, which is also found in several spots of the desert of Sinai, and which resembles thalite, or the green schorl of Dauphiné. It is not found in a separate state, but forms part of the granites, the porphyries, and other rocks.^a Towards the valley of Suez, the mountains are calcareous, and in several places composed of concreted shells.

In the valley of the wilderness,^b sea salt is found in thin compact layers supported by strata of gypsum. In many of the surrounding deserts this salt is very common, sometimes crystallized under the sand, sometimes on the surface.

In Upper Egypt, near Edfoo, the mountains are composed of slate,^c sandstone, white and rose-coloured quartz, and brown pebbles, mixed with white cornelians.^d Near the ruins of Silsilis, the granite rocks contain cornelian, jasper, and serpentine. A little higher in Upper Egypt, the rocks are granite alternated with decomposed sandstone, forming on the surface a friable crust, and presenting the appearance of a ruin.

But the most curious country undoubtedly, is that which is comprehended in the Bahr-bèla-Maié (the river without water) and the basin of the Natron lakes. These two valleys are parallel to each other. The mountain of Natron skirts the whole length of the valley of that name. That mountain contains none of the rocks which are found scattered about in the valley, such as quartz, jasper, and petrosilex.^{e,f}

There is a series of six lakes in the direction of the valley. Their banks and their waters are covered with crystallizations, both of muriate of soda, or sea salt, and of natron, or carbonate of soda. When a volume of water contains both of these salts, the muriate of soda is the first to crystallize; and the carbonate of soda is then deposited in a separate layer. Sometimes the two crystallizations seem to choose separate localities in insulated parts of the same lake.^g

This curious valley is only inhabited by Greek monks. Their four convents are at once their fortresses and their prisons. They subsist only on vegetables. The vegetation in these valleys has a wild and dreary aspect. The palms are mere bushes, and bear no fruit.

Caravans come to this place in quest of natron. According to Andreossy, the farming of the tax on this substance, which is in demand for divers manufactures, was on the same footing with the old gabelle on salt in France.

The valley parallel to that of Natron is called Bahr-

bèla-Maié,^h or "the Dry River." Separated from the valley of Natron by a small ridge of heights, it has for the most part a breadth of eight miles.ⁱ In the sand with which the surface is every where covered, trunks of trees have been found in a state of complete petrification, and a vertebral bone of a large fish. The same stones are met with here as in the valley of Natron. Some of the learned have thought that the stones have been brought to the place by a branch of the Nile which once passed in this direction. The valley of Bahr-bèla-Maié, is said to join Faïoom on the south, and to terminate in the Mediterranean in the north.

These countries have undoubtedly undergone violent revolutions, of a date prior to the present constitution of the globe. Their modern changes have, in extent and importance, been much exaggerated by authors attached to system. M. Reynier judiciously remarks, that the diminution of arable land must have been of older date than any historical records carry us. "Several spots which the ancients have delineated on the borders of the deserts are still in the same situation; the canal of Joseph, though neglected for ages, is not in any part obstructed." Reynier only found one encroachment of the sands on the cultivated land, which was well authenticated; "it is in the province of Djizeh, near the village of Ooardan, where the sands have advanced to the banks of the Nile, and occupy a league of land."^k

Others say that the canal of Joseph is partly choked up with accumulations of slime. This canal is eighty-four miles^l long. It was employed to conduct the water of the Nile into the district of Faïoom, and into lake Mœris, the modern Birket-el-Karoon. It afforded the double advantage of watering completely the lands of Faïoom, and of disposing of a superabundance of water when the overflow of the Nile was extraordinary and excessive. It is probable that this canal, dignified with the name of Joseph, like many other remarkable works, was executed by order of king Mœris. The waters then filled the basin of the lake Birket-el-Karoon, which received the name of the prince who effected this great change. We shall thus reconcile the different positions assigned to lake Mœris by Herodotus, Diodorus and Strabo, and give a reason why the ancients say that the lake was of artificial formation, while the Birket-el-Karoon gives no evidence of any such operation.^m

The maritime districts of Egypt present several lakes, or rather lagoons, which in the lapse of ages sometimes suffer diminution, sometimes enlargement. To the south of Alexandria is lake Mareotis. For many ages this lake was dried up; for though the bed is lower than the surface of the ocean, there is not sufficient rain to keep up any lake in that country in opposition to the force of perpetual evaporation. But in 1801, the English, in order to circumscribe more effectually the communications which the French army in the city of Alexandria maintained with the surrounding country, cut across the walls of the old canal which had formed a dyke, separating this low ground from lake Maadie,ⁿ or the lake of Aboukir on the east. In consequence of this easy operation, the water had a

sudden fall of six feet, and the lake of Mareotis which had so long disappeared, and the site of which had been occupied partly by salt marshes, partly by cultivated lands, and even villages, resumed its ancient extent. The inhabitants of the villages were obliged to fly, and bewail, from a distance, the annihilation of their gardens and their dwellings. This modern inundation from the sea indeed is much more extensive than the ancient lake Mareotis, occupying, probably, four times its extent. The lake of Aboukir has a physical history somewhat similar, having been for two centuries in a dry state, till in 1778, an irruption of the sea broke through the embankment by which it had been previously protected. Lake Etko, to the south-east, has a similar character, communicating with the sea by a narrow mouth, which would admit of being closed up, so as to convert the lake into a dry or a marshy salt plain.

The map of lake Menzaleh, constructed by General Andreossi, furnishes important corrections to the description given of Egypt by D'Anville. This lake is formed by the union of two large gulfs, and bounded on the north by a long narrow stripe of low land, separating it from the sea. The two gulfs are partially separated by the peninsula of Menzaleh, at the extremity of which are found the islands of Matharyéh, the only ones in the lake that are inhabited. D'Anville has also given too much breadth to the northern coast of this lake; and the measurements lately taken differ from his by more than 25,000 yards.^a Lake Menzaleh communicates with the sea only by two navigable mouths, those of Ybeh^b and Omfareddgié,^c which are the Mendesian and Tanitic mouths of the ancients.^d The breadth from the mouth of Ybeh to that of Pelusium is 95,920 yards.^e

It is impossible to fix the number of canals appropriated to the distribution of the waters of the river to the different parts of the country. When we find that one traveller gives 6000 to Upper Egypt alone,^f while another allows only about ninety large canals, viz. forty for Upper Egypt, twenty-eight for the Delta, eleven for the eastern, and thirteen for the western provinces,^g we perceive that a discrepancy so great must arise from the manner of reckoning the canals. One concerns himself only with the large ones, of which the maintenance is established, and the opening fixed, by the regulations of the country. Another extends his views to canals ramifying from these, which vary in number from one year to another. The Mameluke Beys applied to their private use the funds destined to the support of these public works, on which the fertility of Egypt depends. Many canals were even abandoned by these barbarians, who thus destroyed the resources of their own revenues. The most famous of these artificial rivers is the canal of Joseph, or the Calideh-Menhi, which is 110 miles^h long, with a breadth of from 50 to 300 feet. One part of this canal seems to correspond to the ancient canal of Oxyrynchus, which Strabo in sailing along mistook for the Nile itself.ⁱ

Another canal, which, however, was intended solely for navigation, viz. that of Suez, has furnished matter for many discussions; these we shall consider in the next

Book, in which we shall treat expressly of every thing relating to the celebrated isthmus which connects Africa with Asia.

The climate and fertility of Egypt have given rise to an equal number of discrepant opinions among authors. One French traveller finds in this country a terrestrial paradise;^k another assures us that it is a most unpleasant country to reside in.^l Observers of a more composed turn of mind show us how to reduce to their proper value the descriptions of these two volatile writers. The aspect of Egypt undergoes periodical changes with the seasons. In our winter months, when nature is for us dead, she seems to carry life into these climates, and the verdure of Egypt's enamelled meadows is then delightful to the eye. The air is perfumed with the odours of the flowers of orange and citron trees, and numerous shrubs. The flocks overspreading the plain, add animation to the landscape.—Egypt now forms one delightful garden, though somewhat monotonous in its character. On all hands it presents nothing but a plain bounded by whitish mountains, and diversified here and there with clumps of palms. In the opposite season this same country exhibits nothing but a brown soil, either miry, or dry, hard, and dusty; immense fields laid under water, and vast spaces unoccupied and void of culture, plains in which the only objects to be seen are date trees; camels and buffaloes led by miserable peasants, naked and sun-burnt, wrinkled and lean; a scorching sun, a cloudless sky, and constant winds more or less violent. It is not, therefore, surprising, that travellers have differed in their physical delineations of this country.^m

"A long valley," says M. Reynier,ⁿ "encircled with hills and mountains, presents no point in which the surface has sufficient elevation to attract and detain the clouds. The evaporations from the Mediterranean too, during summer, carried off by the north winds, which, in that season, have almost the constancy of trade winds in Egypt, finding nothing to stop their progress, pass over this country without interruption, and collect around the mountains of central Africa. There, deposited in rains, they swell the torrents, which, falling into the Nile, augment its waters, and under the form of an inundation, restore, with usury, to Egypt the blessings of which the defect of rain would otherwise deprive it. Thus, excepting along the sea shores, nothing is more rare in Egypt than rains, and this scarcity is the more marked in proportion as we go southward. The season in which any rain falls is called winter. At Cairo there are, at an average, four or five showers in the year; in Upper Egypt, one or two at most. Near the sea rains are more frequent." This last circumstance, however, shows that the want of rain does not arise solely from the flatness of the surface, but partly from its previous aridity; nothing can be more flat than the sea shores, and the surface of the sea itself, but the perpetual humidity in the latter has the effect of producing a deposition of rain, both on its own surface and on the adjoining-land, to which the more remote sandy expanse of territory is unfavourable. If Egypt were in the hands of a nation and government that cultivated the economical arts with spirit, perhaps the ex-

tension of herbage from the sea shore towards the interior would be followed by an extension of the domain of animating showers.

By a great proportion of the Egyptian farmers, however, the rains are considered as by no means beneficial occurrences, but as only occasioning the springing of a multitude of weeds which prove hurtful to the corn crops.

From the nature of the surface, and the universal aridity of the surrounding deserts, Egypt is much hotter than most other countries under the same parallel of latitude. The heated and rarefied state of that portion of air which is in immediate contact with the sand through the day, is productive of a refraction of the rays of light, giving origin to the surprising appearance called the *mirage*, presenting on the dry surface an exact representation of a lake of water, sometimes ruffled into waves, at other times still and smooth, and appearing to reflect like a mirror the images of houses and other objects situated beyond it. Such is its most common appearance when seen from a distance. This phenomenon is the more striking, as water is generally much in request with the thirsty traveller, in a country where it is so scanty, and so dependent on the vicinity of the Nile, and when the illusion vanishes on his arriving at the spot, he feels a cruel disappointment, especially if not much used to the phenomenon.

The winds are very regular during the months of June, July, August, and September, blowing almost without interruption from the north, and the north-east. In the day the sky is clear, without clouds or mists. But the cooling of the atmosphere consequent on the setting of the sun condenses the vapours. These are then observed to pass with a hurried motion from north to south, and this motion continues till after sunrise on the following day, when the solar heat rarefies them anew and renders them invisible.

The epoch of the decrease of the Nile, which generally takes place in October, is accompanied with intermitting winds. These winds blow from the north, with intervals of calm weather. In winter the winds are changeable; the cloudless atmosphere opposes no obstacle to the action of the solar rays, and vegetation, then in all its strength, applies, with the best possible effect, the moisture contained in the earth. The only symptoms of moisture in the air are the abundant dews deposited in the night, which are always in proportion to the clearness of the atmosphere,^a and some mists which make their appearance in the morning. The latter, however, are comparatively unfrequent.

The approach of the vernal equinox changes the face of the country; the hot south wind begins to blow, but seldom lasts more than three days at a time. When this south wind, called the *khamseen*^b in Egypt, *samiel* in Arabia, and *samoon*^c in the desert, begins to blow, the atmosphere grows thick and hazy, sometimes acquiring a purple tinge; the air seems to lose its power of supporting life and vigour; a dry burning heat reigns universally, and whirlwinds, resembling the blasts of a heated furnace, sweep along the country in frequent succession. They often

raise the sand and even small stones to a considerable height, so as to form a black cloud; and deposit it in large heaps on particular spots of ground. The fine sand is forced into the houses through every cranny, and every thing is filled with it.

The season of the *khamseen* is the only one in which the atmosphere of Egypt is generally unhealthy.^d It is then that the plague makes its appearance in all its dreadful power; a disease, the nature and origin of which still escape the researches of medical science. To us it seems proved that the plague is indigenous in Egypt, and not brought to it from other countries.^e Ancient Egypt was not exempt from this scourge. It is without reason that some modern writers have accused the ancients of exaggerating the salubrity of Egypt. Certain passages in the works of Aretæus of Cappadocia show that a disease nearly allied to the plague was in his time considered as endemic in Egypt and Syria.

The ophthalmia makes greatest ravages during the inundations, a circumstance which shows that it is not entirely owing to the glare of the sun and the heat of the scorching winds. As it attacks principally persons who sleep in the open air, it is natural to look for one cause of it in the copious night dews.^f Some have ascribed it to the natron with which the soil is impregnated, communicating pungent qualities to the air,^g a cause altogether fanciful. It is now well substantiated that this disease is cherished by a specific contagion existing in the country, and singularly favoured by different causes which bring it into frequent activity. Some of these causes are apparently opposite to one another, such as the solar glare, and the nocturnal cold, both of which are known with certainty to be frequent immediate causes of it in individuals.

To an atmosphere thus singularly constituted, and to the regular inundations of the Nile, Egypt is indebted for the advantage which it enjoys of uniting almost all the cultivated vegetable species of the old continent. The culture of Egypt may be divided into two great classes. The one class belongs to the lands watered by the natural overflowings of the Nile, and the other to those which the inundation does not reach, and which are supplied by artificial irrigations.

In the first we include wheat, barley, spelt, beans, lentils, sesamum, mustard, flax, anise, carthamus or bastard saffron, tobacco, lupins, chiches, *barsim* or Egyptian trefoil, fenugreek, pumpkins, melons, cucumbers of different kinds, and lettuce. The best wheat grows at Maraga, in Upper Egypt.^h The district of Akminⁱ produces the largest crops. Barley, with six rows of grains in the ear, (*Hordeum hexastichon*), forms a large proportion of the food given to cattle and horses. The cucurbitaceous vegetables, and also tobacco, and lupins, generally cover the banks of the river in proportion as the water subsides, and the islands which it leaves uncovered. The melons and cucumbers grow almost visibly. In twenty-four hours they gain twenty-four inches of volume,^k but are generally watery and insipid,^l the tobacco is weak, but reckoned

much pleasanter to smoke than that of America. The woad is almost always cultivated in the canals when the water has retired. The flax in several districts is also cultivated on lands artificially irrigated. These cultures are not laborious. After a slight preparatory tillage, the seed is committed to the earth, still moist and slimy: it sinks by its own weight to a due depth, needing no harrowing to cover it; but, if the tillage and sowing are delayed, the soil cracks and hardens to such a degree as not to admit of being cultivated without great toil.^a In Upper Egypt the grain is pulled when ripe; and in some parts of Lower Egypt it is cut with a sickle. The plough used here is simple and better contrived than that of the Arabians.^b

The second kind of culture requires more attention and labour. It is that of lands which, from their elevation, or from the means which localities afford for protecting them from the inundations of the river, are appropriated to plants that require repeated waterings during their growth. These cultures are chiefly on the very banks of the Nile, in Upper Egypt, in Faïoom, and in the lowest part of Egypt, where the waters already exhausted are not in sufficient abundance to cover all the lands. In Upper Egypt, these lands are chiefly sown with the *Holcus dourra*, which forms the prevailing food of the people. The grain is sometimes eaten like maize in a green state, being previously roasted on the fire. The stalk is eaten green like sugar-cane: the dried pith is used for tinder; the leaf is the food of cattle. The stalk is used as fuel for heating ovens. The grain is ground into meal, of which thin cakes are made in the manner of muffins, or crumpets, which eat tolerably well when newly made, but are extremely stale in a short time after. None of the preparations of this grain, in short, are agreeable to a European taste.^c Upper Egypt produces also in this sort of lands the sugar-cane, the growth of which is completed there in a single season, as in Mazanderan on the shores of the Caspian Sea. Indigo and cotton^d are cultivated in the same situation, and in the neighbourhood of the towns some pot-herbs. Faïoom is distinguished for the cultivation of rose bushes, from which is obtained the rose-water, which is in so great request over the East. Pot-herbs are also produced there, and a little rice in the immense ravines which go off from Illahoon, to the north of that province. The lowest part of the Egyptian territory abounds in rice and pot-herbs. The best rice grows in the province of Damietta. The rice culture was introduced under the Caliphs, and was probably borrowed from the Hindoos.^e Doura and maize are still cultivated in the Sharkieh,^f or ancient Eastern Delta, where now a little sugar-cane, indigo, and cotton, are produced.

All lands under the second sort of culture are laid out in artificial squares, separated by low dykes, on the tops of which a small channel is formed. These channels communicate with one another. The water is raised by means of a long lever provided with a weight behind, which assists the ascent of the bucket hung to the extremity of the

longest arm, and which a man depresses by a slight exertion: at the moment of its ascent the water is emptied into a reservoir from which it flows by the channels to the spot to which the person who manages the irrigation chooses to direct it. The motion of the lever not being capable of raising the water more than six feet, the cultivators are obliged to provide themselves with a succession of basins and levers, in proportion to the height of their land above the level of the river. Various other machines are used for raising water,^g particularly the Persian wheel, driven by an ox. In Faïoom, a method of watering the land is in use similar to that which prevails in certain districts of China and Japan. The waters intended for irrigating lands, situated on the sides of the hills and at the bottom of a valley, are first raised to the top by a balance called *deloo*, or *shadoof*. They are received into horizontal channels, and then descend from one channel to another to the lower terraces, which are arranged like the seats of an amphitheatre on the sides of the hills. It must be acknowledged, however, that an injudicious waste of labour is incurred by raising any portion of the water higher than is requisite for diffusing it over that terrace for which it is ultimately designed.

Some European species of fruit trees do not grow in Egypt. This is the case with the almond, the walnut, and the cherry.^h The pear, the apple, the peach, and the plum, are neither plenty nor of good quality;ⁱ but the citrons, lemons, oranges, pomegranates, and apricots, prosper along with the banana, a single tree of which sometimes produces 500.^k The sycamore, or fig of Pharaoh, less valued for its fruit than for its deep and broad shade, the carob, the jujube, the tamarind, and other trees, are cultivated, but none of them are equal in number and usefulness to the date palm, which is cultivated both in lands of natural and those of artificial irrigation. Groves are to be seen consisting of 300 or 400, sometimes of several thousands; the produce of each is valued at one piastre.^l The olive tree is only met with in gardens, but there are some olive plantations in Faïoom, where the inhabitants preserve the fruits in oil, and sell them all over Egypt. The vine, in ancient times, formed an interesting branch of culture. Antony and Cleopatra inflamed their voluptuous imaginations by drinking the juice of the Mareotic grapes. In the days of Pliny, Sebennytyus furnished the Roman tables with their choicest wines.^m At present the vine is not cultivated in Egypt except for its shade and its grapes. Some Christians, who manufacture an indifferent wine in Faïoom, form a very insignificant exception. The vines of Foua, mentioned by former travellers, are no longer in existence.

A large and beautiful fruit tree, celebrated among the ancients, the *persea* of the Greeks, and the *lebakh* of the Arabians, seems to have disappeared from the Egyptian soil;ⁿ at least, naturalists cannot recognise it in any of the species now existing in that country. It has been supposed to be the aguacate or *avocatier*^o of St. Domingo, to which, in consequence of this conjecture, botanists have given the

name of *Laurus persea*.^a Others have attempted to prove the identity of it with the sebesten,^b but the differences are too glaring to allow this hypothesis to be tenable. We are only assured by positive testimony that this tree had become more and more rare, and at last disappeared before the year 700; and that having come from Persia, where its fruit was crude and bitter, it acquired by culture those excellent qualities for which it was so celebrated; these circumstances ought to have led naturalists to look for this tree in the East Indies.

Another production of Egypt, which makes a great figure in the writings of antiquity, is the *lotus*. This word was taken in different acceptations.^c The plant properly called the lotus is a species of *nymphaea*, or waterlily, which, on the disappearance of the inundation, covers all the canals and pools with its broad round leaves, among which the flowers, in the form of cups of bright white or azure blue, rest with inimitable grace on the surface of the water. There are two species of the lotus, the white and the blue, both known to the ancients, though the blue kind is most frequently mentioned. The rose-lily of the Nile, or the Egyptian bean, which is frequently carved on the ancient monuments of Egypt, is not at present found in that country. This plant would have been unknown to naturalists if they had not found it in India. It is the *Nymphaea nelumbo* of Linnæus. It was on this plant that the lotus-eating^d Ethiopians lived. But the fruits of the lotus, praised by Homer, and which so much delighted the companions of Ulysses, were those of the modern jujube, or *Rhamnus lotus*. This same tree is described by Theophrastus under the name of the lotus, and is perhaps the *dudaïm*^e of the Hebrew writings. Lastly, the plant called by Pliny *Faba græca*, or *lotus*, is the *Diospyros lotus*, a species of guayacana^f or ebony. The *papyrus*, equally celebrated in ancient times, and which was believed to have disappeared from the banks of the Nile, has been re-discovered in the *Cyperus papyrus* of Linnæus. The *colocasia*, so renowned in antiquity, is still cultivated in Egypt for the sake of its large esculent roots.

Egypt, so rich in cultivated plants, is destitute of forests. The banks of the river and of the canals sometimes present us with coppices of *acacias* and *mimosas*. They are adorned with thickets of rose laurel, of willows,^g (the *Salix ban*, of Forskal,) cassias, and other shrubs. Faïoom contains impenetrable hedges of *cacti*. This illusory appearance of forests furnishes the Egyptians with no firewood, and all that they make use of is brought from Caramania.^h The peasants burn cow-dung, which they collect with an almost ludicrous solicitude. Scarcely does one of these animals show a disposition to part with any refuse, when the peasant stretches out his hand to receive it.ⁱ

The economical year of Egypt presents a perpetual circle of labours and enjoyments. In January, lupins, the dolichos, and cummin, are sown, while the corn shoots into ear in Upper Egypt; and in Lower Egypt the beans and flax are in flower. The vine, the apricot, and the palm tree, are pruned. Towards the end of the month, the

orange, the citron, and pomegranate trees, begin to be covered with blossoms. Sugar cane, senna leaves, and various kind of pulse and trefoil, are cut down. In February all the fields are verdant; the sowing of rice begins; the first barley crop is harvested; cabbages, cucumbers, and melons, ripen. The month of March is the blossoming season for the greater part of plants and shrubs. The wheat sown in October and November is now gathered. The trees which are not yet in leaf are the mulberry and the beech. The first half of April is the time for gathering roses. Almost every sort of corn is cut down and sown at the same time. Spelt and wheat are ripe, as well as the greater part of the leguminous crops. The Alexandrian trefoil^k yields a second crop. The harvest of the winter grain continues during the month of May; *Cassia fistula* and henné are in flower; the early fruits are gathered, such as grapes, Pharaoh's figs, carobs, and dates. Upper Egypt has its sugar cane harvest in June; the plants of the sandy grounds now begin to wither and die. In the month of July, rice, maize, and canes, are planted; flax and cotton are gathered: ripe grapes are abundant in the environs of Cairo. There is now a third crop of trefoil. The nenuphar and jessamin flower in August, while the palm trees and vines are loaded with ripe fruits, and the melons by this time have become too watery. Towards the end of September, oranges, citrons, tamarinds, and olives, are gathered. This is the season of the principal rice harvest. At this time, and still more in October, all sorts of grain and leguminous seeds are sown; the grass grows tall enough to hide the cattle from the observer's view; the *acacias* and other thorny shrubs are covered with odoriferous flowers. The sowing continues more or less late in November, according to the degree in which the waters of the Nile have retired. The corn begins to spring before the end of the month. The narcissuses, the violets, and the colocasias, flower on the dried lands; the *nenuphar* disappears from the surface of the waters; dates and the sebesten fruit are gathered. In December, the trees gradually lose their foliage; but this symptom of autumn is compensated by other appearances: the corn, the long grass, and the flowers, every where display the spectacle of a new spring. Thus in Egypt the land is never at rest. Every month has its flowers, and all the seasons their fruits.^l

The animal kingdom of Egypt will not detain us long. The want of meadows prevents the multiplication of cattle. They must be kept in stables during the inundation. The Mamelukes used to keep a beautiful race of saddle horses. Asses, mules, and camels, appear here in all their vigour. The numerous buffaloes often attack the Franks on account of their strange dress, and frequently bright colours, particularly when they happen, as in the instance of the British soldiers, to be dressed in scarlet. In Lower Egypt there are sheep of the Barbary breed. The large beasts of prey find, in this country, neither prey nor cover. Hence, though the jackal and hyena are common, the lion is but rarely seen in pursuit of the gazelles which traverse the

deserts of the Thebaid. The crocodile and the hippopotamus, those primeval inhabitants of the Nile, seem to be banished from the Delta, but are still seen in Upper Egypt. The islands adjoining the cataracts are sometimes found covered with flocks of crocodiles, which choose these places for depositing their eggs. The voracity of the hippopotamus has, by annihilating his means of support, greatly reduced the number of his race. Abdollatif, with some justice, denominates this ugly animal an enormous water-pig. It has been long known that the ichneumon is not tamed in Egypt, as Buffon had believed. The ichneumon is the same animal which the ancients mention under that name, and which has never been found except in this country. Zoology has lately been enriched with several animals brought from Egypt, among which are the jerboa, *Dipus meridianus*, a new species of hare, a new fox, a hedgehog, a bat, and four species of rats, two of which are bristly. The *Coluber haje* has also been found, an animal figured in all the hieroglyphical tables as the emblem of providence; and the *Coluber vipera*, the true viper of the ancients.

The Nile seems to contain some singular fishes hitherto unknown to systematic naturalists. Of these the *Polypterus bichir*, described by Geoffroy-Saint-Hilaire,^a is a very re-

markable example. That able naturalist observes, in general, that the birds of Egypt do not much differ from those of Europe. He saw the Egyptian goose represented in all the temples of Upper Egypt, both in sculptures and in coloured paintings, and entertains no doubt that this bird was the *Chenalopex* of Herodotus, to which the ancient Egyptians paid divine honours, and had even dedicated a town in Upper Egypt, called *Chenoboscion*. It is not peculiar to Egypt, but is found all over Africa, and almost all over Europe. The *Ibis*, which was believed to be a destroyer of serpents, is, according to the observation of Cuvier, a sort of curlew, called at present *Aboohannes*. Messieurs Grobert and Geoffroy-Saint-Hilaire have brought home mummies of this animal, which had been prepared and entombed with superstitious care.^b

The Egyptians keep a great quantity of bees, and transport them up and down the Nile, to give them the advantage of the different climates, and the different productions of Upper and Lower Egypt. The hives are kept in the boats. The bees spread themselves over both banks of the river, in quest of food, and return regularly on board in the evening.

BOOK LXI.

EGYPT.

PART II.

Inquiries relative to the Isthmus of Suez, and the extremity of the Arabian Gulf.

IN taking a general view of Africa, and tracing the physical geography of Egypt, an interesting and curious subject must have suggested itself to the minds of our well informed readers. We have deferred the examination of it till now, that we might render it more complete by making it the subject of a separate book.

Has the isthmus of Suez always existed? Has Africa ever been an island? Or at least has the neck of land which connects it with Asia been at any time much narrower than now? These questions have, since the publication of the labours of the Egyptian Institute, even divided intelligent men who have visited the country.

Let us begin with an account of the facts. The isthmus in its present state is a low lying land, composed of shell limestone rocks, mixed with strata of sandstone, and partly covered with sands, or with pools of brackish water. In several places the solid strata are with difficulty perceivable by their slight undulations; in the northern part, in particular, there is a vast plain, varied only by the inequalities created by sand hills. In the middle of its breadth, ridges of hills show their bare heads at certain distances, like a series of large steps. To the east, the south-east, and the south-west, the mountain chains of Arabia Petraea and of Egypt skirt at a distance the table land of the isthmus, which is terminated at the Red Sea.^a The lake Birket-el-Ballah, adjoining lake Menzaleh, Temsah or Crocodile Lake, and the almost dry basin of the Bitter Lakes, form, from north to south, a series of depressions, interrupted only by stripes of low land. This line, prolonged on one side to the mouth of Tineh, and on the other to the extreme point of the Gulf of Suez, marks the natural boundary of Africa. The breadth of the isthmus, in a straight line, is 378,844 feet, or nearly seventy-two miles.^b

The surface of this isthmus generally declines from the shores of the Red Sea towards those of the Mediterranean. The level of the latter sea is thirty feet lower than that of the Gulf of Suez.^c There is a similar descent towards the Delta and the bed of the river Nile. The level of the water of the Nile at Cairo at its lowest, in 1798, 1799, and 1800, was nine feet lower than the surface of the gulf at low water. But the Nile rising sixteen cubits by the Nilometer, is nine feet higher than the Red Sea at high water, and fourteen higher than the same sea at low water.

Besides these leading inclinations of the surface, there is a particular one in the middle of the isthmus. The deep basin of the Bitter Lakes is more than fifty-four feet lower than the level of the Red Sea, the waters of which would enter and fill it, if they were not prevented by a little sandy isthmus from one to three feet above the level of the sea. In another direction the valley of Sababhyar, and that of Ooady-Toomylat,^d open to the waters of the Nile, during its rise, an entrance into the basin of the Bitter Lakes.

From this account, it follows that the Red Sea never could have occupied the basin of the Bitter Lakes in a constant manner, because its waters, if raised sufficiently high to form such a communication, would have found no barrier to the north of that basin: they would have flowed all the way to the Nile by the Ras-el-Ooadi, and to the Mediterranean by the Ras-el-Moyah. The two seas thus brought into mutual contact would have reached a common level, and the strait would have become permanent. We do not deny the possibility of a sudden violent irruption, but only that of a permanent communication.

But it will be said, the Mediterranean may have been formerly thirty or forty feet higher than now; in that case it must have covered, in a great measure, the Delta and the isthmus; it must have penetrated into the basin of the Bitter Lakes, which is now only separated from the Gulf of Suez by a tongue of low land, which perhaps has not always existed. This is the only rational hypothesis that can be advanced in favour of the existence of an ancient strait in this situation. But it is evidently a hypothesis which goes back to an epoch anterior to history, for no authentic testimony of such a state of things is now in existence. The vague traditions mentioned by Homer and Strabo on the separation of the isle of *Pharos* from the continent, would not even on the system of those who believe them,^e afford proof of so great a change. But these traditions, when duly weighed, prove, in fact, nothing at all; for the removal of *Pharos* from the river of Egypt to a distance of seven days' sail, may be found, along the present coast, taking the Sebennitic mouth for that by which *Meneleus* entered. It is also possible that the Delta, inhabited by savage shepherds, was not yet a part of the kingdom of Thebes, or Egypt properly so called. At all events, an account so vague cannot be received as a historical proof.

Shells, crystals of sea salt, and brackish waters, are found

^d "Ooady-Toomylat," the *Wadi* or valley of Toomylat.—P.

^e Dolomieu, Journal de Physique de Delamétherie, t. XLII.

every where, even to the centre of Africa. These remains of ancient catastrophes, have nothing in common with events belonging to historical epochs.

One plausible geographical proof has been brought forward to show that the limits of the Red Sea have been contracted. This is the position of *Heröopolis*.^a We shall discuss anew this important question, and in defending, with certain modifications, and by some new arguments, the hypothesis of M. d'Anville, against the opinions of Messrs. Gosselin and Rozière, we shall show that this hypothesis does not lead to the consequences which Messrs. Lepère and Dubois-Aymé have drawn from it with regard to the contraction of the gulf.

Some insurmountable arguments concur to place the city of *Heröopolis*, mentioned by Strabo, Eratosthenes, and the Itineraries, at Abookesheyd, in the valley of Sababhyar, to the north-west of the Bitter Lakes. We do not indeed believe this city to be identical with the *Patumos* of Herodotus,^b and the *Pithom* of the sacred Scriptures.^c The Seventy interpreters, and the Coptic translator, not only agree indeed in considering Pithom and *Heröopolis* as identical, but in confounding them with *Rameses*, the capital of the land of Goshen, the abode of the Israelites. But, as Herodotus makes *Patumos* the site of the beginning, and not of the termination of the canal of the two seas,^d it is evident that this place cannot be at a great distance from the Nile. We think that Pithom corresponds to the fortified place called Thou in the Itinerary of Antoninus, and Tohum in the Account of the Empire, a place situated at the very point at which the canal enters the desert, and where the inundations generally terminate. Herodotus having seen these places while the waters were at their height, may have believed that the canal began here; but *Heröopolis* is certainly the same city with that called *Hero*^e in Antoninus's Itinerary, and in Stephen of Byzantium. This last lexicographer gives us a formal assurance of it. The measurements of the Itinerary, in the most authentic manuscripts, correspond well with the situation of the very remarkable ruins discovered at Abookesheyd, among which is recognized a caravansera, an evidence of the busy trade which must have been carried on at that place.

In order to assist our readers in forming a proper idea of the argument, we have reduced the distances of the ancient and modern places to the form of a table.

The places, according to the ancient and modern names.	Distances in the Itinerary.		Distances measured on the hydrographic chart of Lower Egypt.
	In Roman miles.	In English feet.	
Babylonia (Old Cairo) - - -			
Heliou (Ruins of Heliopolis) -	XII	57,994	53,136
Scenæ Veteranorum (Menair) -	XVIII	86,992	68,880
Vicus Judæorum (Belbeis) -	XII	57,994	54,120
Thou or Tohum (Pithom. Ab- basah) - - - - -	XII	57,994	65,600
Hero or Heröopolis (Cherosh. Abookesheyd) - - - - -	XXIV	115,990	118,080
Serapeum (Ruins to the north of the Bitter Lakes) - - -	XVII	96,832	75,440
			229,600 by the west side of the lakes.
Clyasma (Ruins of Kolzoom to the north of Suez) - - -	L	241,647	239,440 by the east of the lakes.
	CXLVI	715,443	664,856 by the west side. 674,696 by the east side.

If it is considered that we do not know the windings of the road, and can only form an imperfect estimate of them, the coincidence between the sums total of the measurements will appear very striking. But it is farther possible to remove the disagreement of some of the partial numbers; for the Itinerary in another passage gives the distances from Heliopolis to Thou in the following manner.

Names of Places.	Distances in the Itinerary.		Distances by the Chart.
From Heliou to Scenæ Veteranorum - - - - -	XIV m. p.	67,650	
From Scenæ to Thou, - - - - -	XXVI	125,719	119,720
	XL	193,378	188,600

The testimony of Strabo, or of the authors whom he has followed, is perfectly reconciled with that of Stephanus and of the Itinerary. This geographer adopts expressly a passage of Eratosthenes, which runs thus: "After the city of *Heröopolis*, which is on the Nile, we find the extremity of the Arabian Gulf."^f Thus *Heröopolis* must be situated in a place which the waters of the Nile can reach, consequently on a canal connected with that river. How could Messrs. Gosselin and Rozière overlook an authority so formal and so worthy of confidence?

The other passages of Strabo and of Pliny do not contradict one another. Sometimes it is asserted that *Heröopolis* is near *Arsinoe*, or *Cleopatris*, which is on the gulf,^g but we are not to conclude with confidence that these authors place *Heröopolis* itself immediately on the gulf. Sometimes we are told that the Heröopolitan gulf derives its name from this city, which is in its neighbourhood. But we must not give these words a meaning in contradiction with other more positive expressions. The example of the gulf of Lyons shows that it is not necessary that a city should be on the very shores of a gulf to which it gives its name.

Some mythological traditions brought forward in this discussion may furnish a subject for fresh local research. "*Hero* or *Heros*, is a city of Egypt, called also Haimos, (blood) because *Typhon* being there struck with a thunderbolt,^h stained the ground with his blood." But Herodotus tells us of a place called *Erythré-Bolos*, that is, "Red clay."ⁱ Now *Typhon* was called by the Egyptians *Rosh*, or the red, and the words "red earth," or "earth of *Typhon*," were in their language translated into *Cherosh*.^k Is it not probable that Herodotus has given a simple, and Stephanus a poetical translation of the Egyptian name of the city of *Typhon*? The true name of this city, *Cherosh*, preserved in the Itineraries, has thus been transformed by the Greeks into *Heröopolis*, or "the city of heroes." To give these connections of circumstances the force of an argument, it would be sufficient to find near the locality

which we assign to *Heröopolis*, a soil composed of red clay.

The position of *Heröopolis*, or rather *Heros* or *Cherosh*, being fixed by the Itinerary to the north-west of the Bitter Lakes, it is evident that this city never could, at least not in the time of Strabo, be found on the shores of the Red Sea. For, as the levels of the ground demonstrate, if the waters of that sea had filled the basin of the lakes and the valley Sababhyar, they would also have come in contact with those of the Nile. There would have been a real strait, and the execution of a canal would have been superfluous. But as the basin in Strabo's time communicated with the Red Sea by a canal, and could at pleasure be filled with the waters of that sea, the basin might with some reason be considered as a prolongation of the gulf, and *Heröopolis* spoken of, as the place where the navigation of small vessels commenced, as the seat of a great trade both maritime and inland, and as a city worthy of giving its name to the gulf.

Having hitherto intentionally kept Ptolemy out of view, we now proceed to comment on his evidence, which appears to be at utter variance with all the attempts at conciliation in which we have been engaged.

When the canal, neglected and deserted, no longer supported the commerce of *Heröopolis*, it is probable that the inhabitants transferred their abode to a place near the gulf itself, or rather were removed to another city which may have taken the name of *Heröopolis*, on becoming the capital of the district^a or prefecture.

This new *Heröopolis*, the only one known to Ptolemy, may have been properly placed by that geographer in a latitude a little north of Suez. We think that this second *Heröopolis*, marked in Ptolemy's tables,^b occupied a place marked by some ruins, to the north-east of the end of the gulf: which agrees sufficiently well with M. Gosselin's opinion, in the other parts of which we do not acquiesce.^c These ruins cannot belong to *Arsinoë*, surnamed *Cleopatris*, as the engineers of the French army of Egypt believed; for that city was, according to one who was probably an actual observer, situated at the end of the canal of the two seas;^d and it was in its harbour that *Ælius Gallus* collected the war galleys intended to act against the Arabians. This passage, overlooked in recent discussions, seems to fix the position of *Arsinoë-Cleopatris* to the north of Kolzoom. The small creek which forms the inner harbour of Suez, corresponds to the Charanda Gulf^e of Pliny, where this Roman geographer seems to place also the small place *Aennum*;^f probably Bir-Suez, and the *Daneon*, or lower harbour,^g which may represent the town of Suez itself.

The whole of the obscurity attached to the *Heröopolis* of Ptolemy will not be removed unless we can also fix the position of *Clyisma*, which was at first only a strong hold.^h The hypothesis of the learned M. Gosselin, of there being two places called *Clyisma*, falls to the ground with the false version of M. De Guignes, on which it was founded: it is proved that no Arabian author has said what this oriental-

ist has ascribed to Ibn-al-Vardi.ⁱ All the oriental writers acquiescing in a tradition universal among the inhabitants of the country, place Kolzoom, or Klisma, a little to the north of Suez, where Niebuhr saw its ruins. The meaning of the Greek name also shows that this fortress^k must have been situated near the sluice which dammed up the canal. The same position is assigned to it by the measurements of the Itinerary, if from *Serapéum* we follow the sinuosities of the west bank of the Bitter Lakes. The table of Peutinger seems, indeed, to place *Clyisma* beyond the canal, and also beyond the gulf; but, as the distance given in the tables would remove its situation to Arabia Petræa, twice as far south as the fountains of Moses, this obscure passage can neither support the one nor the other side of the questions now under discussion.

The name of the fortress seems to have been afterwards given to the town which it commanded. But was this town still after the Arabian conquest, the ancient *Arsinöe*, to the north of *Clyisma*, or the modern city of Suez, to the south of it? The passages quoted from the Arabian authors furnish no data on the question. At all events, in the fifth century, the name of *Clyisma* was, from the city, given also to the gulf.^l It was in imitation of the Greeks, that the Arabians said, the *sea* of Kolzoom, an observation which escaped the learned commentator of Edrisi. The name, then, might naturally be given to the chain of mountains bounding the west side of the Gulf of Suez; though we must not look there for a city of the same name.

This discussion leaving no doubt respecting the position of the city of *Clyisma*, we ask, why Ptolemy has removed it so far to the south, by placing it at least forty minutes (miles) from his *Heröopolis*? The answer is easy. He only knew the position of *Clyisma* by its distance from the *old Heröopolis*, which is not much less than forty minutes, and he transferred this same distance to the south of the *new Heröopolis*.

Ptolemy's text, thus explained, furnishes no argument for or against the contraction of the sea: It does not oppose it, for the position of the old *Heröopolis*, the principal proof of the hypothesis of the contraction, is independent of that which Ptolemy gives to the new city of that name. Nor does it favour the hypothesis; for new *Heröopolis* and *Arsinöe* were of contemporaneous existence with the fortress of *Clyisma*; the one was the capital of the nome or district, the other, like the port of Suez now, was the point of departure for ships. We have no evidence that the new *Heröopolis* was on the very shore of the gulf, and that the latter must, therefore, have retired 5970 yards,^m as Gosselin maintains.ⁿ

Having shown that the topography of *Heröopolis*, agreeable to the system of d'Anville, does not lead necessarily to the inference of a change in the shores of the Red Sea, we should now discuss the actual measures which the ancients have left us of the breadth of the isthmus. But our uncertainty respecting the value of the *stadium* renders the discussion fruitless. If the thousand stadia as-

^k Κλύσμα, irrigation, inundation, sometimes signifies the same as κλύσση, a gutter, a syringe. Lucian, in the *Pseudomantis*, speaking of this place, couples with it the article, τῷ κλύσματος ἰ. e. the dam or flood-gate. Strabo speaks of a κλείστος Ἐθιοπίας.

^l Philostorg. Hist. Ecclesiast. III. chap. 6.

^m 2800 toises.

ⁿ Recherches sur la Géographie, II. p. 184

signed by Herodotus were Egyptian stadia of 108 yards,^a they would bring the extremity of the gulf only to the south end of the Bitter Lakes. But these lakes being considerably lower than the surface of the gulf, the latter could not have stopped at this point, where no barrier was presented to it. The 900 stadia of Strabo, and the 817 of Marinus Tyrius, considered as Egyptian stadia, favour somewhat more the contraction of the isthmus, but without being decisive. If we reckon them as stadia of 700 to the degree, these measures support the opinion that the state of the isthmus has not altered.^b

As we must take every fact into view, we acknowledge that the march of the Israelites in leaving Egypt, has furnished an argument for a contraction of the gulf.^c This line of march would appear more probable, if we should suppose that the Red Sea extended as high as Sababhyar; we should then conceive that this fugitive tribe, coming from the neighbourhood of Abbaseh and of Belbeis, and bending their course to the desert, fell in with the sea in the neighbourhood of Heröopolis, and, in consequence of an extraordinary tide, or a violent wind, found the isthmus dry, which at present separates the Gulf of Suez from the basin of the Bitter Lakes.

This view of the matter would be very favourable to an improved interpretation of a passage^d in which the translators have made the author of the Books of Moses say, (Exodus, chap. xiv. verse 22d and 29th) that the waters stood up on the left and on the right of the Israelites like a wall, but where the text only says that the waters were like a wall, or a rampart, on their left and on their right. An army, in fact, passing between the Gulf and the Bitter Lakes would have both flanks covered in this manner.

Another argument is furnished by the pretended identity of Heröopolis with the Baal-Zephon of the Hebrew text.^e Sefhon, or Sophon, we are told, is one of the names of Typhon; and the city of Cherosh, Heros, or Heröopolis, is the city of Typhon. The Israelites, before passing the sea, encamped opposite to Baal-Zephon: that town must, therefore, have been only a short way from the shores of the gulf.

This argument, drawn from etymology, however, admits of a corresponding reply. Baal-Zephon^f literally signifies "the Lord of the North;" and may be applied to any city to the north of the termination of the gulf opposite to Ajerood, or Hagirood, which to us appears identical with the *Hachiroth* of Moses.

The narrative of the Hebrew legislator, though simple, and carrying conviction along with it, is not sufficiently circumstantial to allow us to entertain a hope of explaining it. The poetic hymn with which it is accompanied, and which contains the most important details, does not admit of a precise interpretation. All the information that these records give us in physical geography is, that in former times, as in our own, the level of the gulf was liable to considerable variation from the influence of the tides and the winds.

If the isthmus of Suez has not undergone any change within the limits of history, particularly no remarkable contraction, if a natural communication between the two

seas has never existed within the periods of human record, we know that industry has attempted to open by art, a passage which nature had denied. The forming of a canal between the two seas has been the subject of many projects and many discussions. The engineers of the French army of the east ascertained the traces and remains of a canal, with a most satisfactory precision. The canal goes from Belbeis (*Vicus Judæorum*) on the ancient Pelusiæ branch of the Nile, now the canal of Menedji, to Abbaseh, the ancient *Thou*. There it enters the narrow valley of the Toomylat Arabs,^g the level of which is from two to thirty-three feet lower than that of the Red Sea. Several portions of the bed of the canal are still in such a state of preservation as to require nothing except cleaning. It passes on to Abookesheyd, which is considered as identical with the old Heröopolis. The basin of the Bitter Lakes might have been filled at pleasure from the waters of the Nile: beyond this basin, the traces of the canal reappear in the isthmus which separates the lakes from the Red Sea, and show that the canal was continued the whole way.^h But to what age and to what potentate is this great work to be referred? We do not speak of the fabulous times of Sesostris and Menelaus. Two kings, better known in history, Necho and Psanmetichus, do not appear to have completed it. They, like Darius, were prevented by the dread of seeing Egypt inundated by the bitter waters of the Red Sea, which were known to have a higher level than the Nile. It would have been a sacrilegious act to have thus admitted the malignant Typhon into the happy empire of Osiris. The use of locks and floodgates was unknown, which would have protected the Egyptian fields from this imaginary danger. The Ptolemies, according to Strabo,ⁱ who had travelled in Egypt, completed the canal. According to Pliny, they only carried it as far as the basin of the Bitter Lakes.^k The former of these authors makes Phacusa the point at which the canal communicated with the Nile, which would suppose this canal to be a different one from that which has been recently traced. The latter gives, in Roman paces, the exact measure of the length of the canal from Belbeis to the Bitter Lakes, as well as that of the total distance of the Gulf of Suez from the Nile, both of which measurements are found correct. If so well-informed a writer believed that the canal did not extend to the Red Sea, which its vestiges show it to have done, we here find a proof that the navigation of it had been relinquished. Perhaps the sluices had not been well constructed, or it had been found more convenient and profitable to convey merchandise by the harbours of *Myos-Hormos* and *Berenice*. The emperor Adrian, who caused a canal to be formed to the east of the Nile, called *Trajanus Annis*, and which went off from Babylonia, seems to have intended it solely for irrigations, by means of which the province of Augustamnica was rendered a flourishing country.

But the Arabians, particularly El-Magrizi and El-Makyn, attest that this canal was opened again by order of the Caliph Omar, and was used for navigation from the year 644 to 767. At this time another caliph caused it to be shut up, in order to deprive a rebel chief of his supplies of provi-

sions. The Ottoman emperors have oftener than once contemplated the re-establishment of this canal. While the French army was in Egypt, some learned discussions were maintained on the practicability and advantages of such a re-establishment. A steady and enlightened government could execute the project at a moderate expense. The value of the lands which by means of it would be brought into cultivation, would be more than sufficient to cover it. But, as the navigation would, on the one side, depend on the rising of the Nile, and, on the other, on the monsoons which prevail in the Arabian gulf; and as these two conditions do not coincide to such a degree as to allow an uninterrupted navigation, it is very probable that this canal, though highly useful and necessary for the commercial prosperity of Egypt, would produce no great revolution in the East Indian trade.

BOOK LXII.

EGYPT.

PART III.

Topographical and Political Details.

IN our physical sketch of Egypt, we traced the influence of a monotonous territory and an unchanging climate. A certain gloom will also be attached to our accounts of the cities and towns of a country which has been so often described. We must always sail along the river or its canals, always admire antique monuments which we are unable to explain, always cast a mournful look on modern towns fast hastening to destruction, surrounded by palms and sycamores. On every hand oppression, misery, distrust and discord hold possession of a country so well fitted to become the abode of happiness and prosperity.

In order to give some interest to this account, it is necessary to call to mind at every step the nations which have successively ruled this country, and have left monuments behind them. In the history of every age Egypt holds a conspicuous place. Under her Pharaohs she derived strength from the stability of her laws, and was often the successful rival of the greatest monarchies of the world. Invaded and devastated by Cambyzes, she was for 193 years either the subject or the vassal of Persia, and frequently in a state of open rebellion. The Greeks lent her their assistance, and Alexander the Great was received by her as a deliverer; perhaps he intended to make this country the seat of his empire.

For three centuries the Ptolemies made Egypt a flourishing country in commerce and the arts, and her cities under them were almost converted into Grecian colonies. Augustus united this fertile kingdom to the Roman empire, and for 666 years it was the granary of Rome and Constantinople. It formed one of the earliest conquests of the successors of Mahomet. About the year 887, the power of the caliphs was succeeded by the reign of the Turcomans, their own janissaries, whom they had called to their aid. The dynasties of the Tolonides, the Fatimites, and the Aioobites, ruled over Egypt till the year 1250.

The Mamelukes, or military slaves of the Turcoman sultans of Egypt, then massacred their masters, and took possession of the sovereignty. The Turkish dynasty, or that of the Bassarite Mamelukes, reigned till 1382. The Circassian race, or that of the Bordjite Mamelukes, ruled here till within these very few years; for Selim II. emperor of the Ottomans, after taking possession of Egypt, only abolished the monarchical form of government of these Mamelukes; he allowed an aristocracy of twenty-four Beys to remain, subjected to a stated tribute. After his death, the Mamelukes more than once threw off the authority of the Ottomans.

In 1798, the French abolished the Mameluke aristocracy, and made themselves masters of the whole of Egypt. A

great European colony now seemed to spring up in this fine country, and a fair hope was cherished for the progress of civilization. The sciences, and especially that of geography, would have derived inestimable accessions from the success of that noble project. But it was attempted during the bloody wars and jealousies by which enlightened Europe was distracted. Far from being concerted by the combined wisdom of the civilized world, and supported by its united energies, it was undertaken in subserviency to the paltry object of gratifying the selfish glory of Buonaparte, and the aggrandizement of the French nation, which had tarnished the liberal character of her revolution, and lost the confidence of every philanthropic mind by the barbarous pillage of Sierra Leone. The rival selfishness of Great Britain, aiding the views of the Sublime Porte, poured from the British Isles, from the Bosphorus, and the Ganges, numerous armies to exterminate the French army, which was too happy to take shelter under the wing of the civilized maxims of war, and return safe to Europe, to avoid falling under the ruthless sabre of the Turks. In 1801 this evacuation was effected, and barbarism again took possession of her prey. Perfidious assassinations, and merciless massacres, have signalized the contests between the Turkish government and the Mamelukes, and between the latter and the now almost independent Pasha of Egypt. A ray of improvement in the arts, and of encouragement to industry, has unexpectedly begun to glimmer amidst the arbitrary sway of the ruffian masters of Egypt; but under such patronage, permanent advancement in civilization cannot be expected.

The ancients divided Egypt according to a principle afforded them by the course of the river; into Upper Egypt, called the Thebaid, because Thebes was its capital; Middle Egypt, called also the "Seven Governments," or the Heptanomis; and Lower Egypt, or the Delta, extending to the sea.

The Arabs and Ottomans have only changed the names of these divisions:

1. Upper Egypt is called the Saïd, and includes the provinces of Thebes, Djirdjeh, and Sioot.
2. Middle Egypt is called the Vostani, consisting of the provinces of Faioom, Benissoef, and Minyet.
3. Lower Egypt is called the Bahari, or "the Maritime Country," and includes the provinces of Bahyreh, Rashid or Rosetta, Gharbyeh, Menoof, Massoorah, Sharkieh, and the Cairo district, consisting of the subdivisions of Keliobieh and Atfihieh.^a

^a These were the divisions of the country at the time of the French invasion.—M. B.

The appellation of Upper Egypt is sometimes taken in a strictly physical acceptance, and made to include all the provinces above Cairo.^a On this principle Abulfeda and Ebn-Haukal divide Egypt into two parts, the *Rif* and the *Saïd*, that is, the coast and the high country.^b Another Arabian calls these divisions Kibli and Bahari, or the south and the coast.^c But the most recent observations, by making us acquainted with a defile or contraction, separating the Vostani from the Saïd proper, incline us to prefer the usual threefold division.

We shall first take a view of the towns and remarkable localities of Lower Egypt.

The ancient glory of Alexandria is still attested by the extensive ruins by which the present city is surrounded, and in a manner concealed. It is built on a sandy stripe of land formed by the sea, along the ancient mole which once connected Pharos with the continent. Of its two harbours the most easterly seems to have lost its former advantages by the changes which the coast has undergone. The ancient promontory, the situation of the modern Pharillon, has been worn away and destroyed by the waves; its ruins have been carried into the interior of the harbour, where the vessels have also been long in the habit of discharging their ballast. The famous Pharos, built on the island (now a peninsula) of the same name, serves as a light-house at the entrance of the harbour, or rather roadstead, where vessels are frequently lost. The other extremity of the peninsula surrounds in part the western or old harbour, which is possessed of great advantages, but shut against Christians. To the south of the modern city and of the two harbours is the site of old Alexandria.

Here, among heaps of rubbish, and among fine gardens planted with palms, oranges, and citrons, are seen some churches, mosques, and monasteries, and three small clusters of dwellings, which form as it were three towns, one of which is surrounded with a wall, and called the fort. Traces are seen of ancient streets, in straight lines, and some ruins of colonades mark the sites of palaces. One of the obelisks, called Cleopatra's Needle, still stands upright. All this confused mass of ruins, gardens, and houses, is in the greater part of its circumference, surrounded with a high and double wall. The commission of the French Institute of Egypt seemed to regard this inclosure as the work of the Arabians. Such also is the opinion of Niebuhr, Wansleb, and the greater part of travellers. Pococke, however, thinks that the Arabians only built the inner wall; and Baron de Tott believes that nothing about it is modern, except some local reparations. To us this inclosure appears to represent precisely the space of thirty stadia in length, and ten in breadth, which Strabo assigns to the dimensions of the city of Alexander and the Ptolemies. Only that part of the wall which extends from the Rosetta Gate towards the Roman Tower, in a direction from east-south-east to west-north-west, seems to pass through the ancient quarter of Bruchium, which, filled with palaces and monuments, extended quite round the

New Harbour. Might not this part of the wall be the work of Caracalla, when, according to the expression of Dion the historian,^d that ferocious beast of Ausonia came to devastate and drench with blood the beautiful city of Alexandria? Even the forts which exist to the north and south of the ancient city seem to be those erected by that tyrant. We also think that many of the ruins date from the epoch of the capture of the city by the cruel Aurelian.

On the outside of the southern gate, a detached column eighty-eight feet high, forms the most commanding object connected with the city and its environs. It has been erroneously called "Pompey's Pillar," and "the Pillar of Severus." It is the great column which served as the principal ornament of the famous Serapéum, a vast building consecrated to the worship of an Egyptian divinity, and which, after the destruction of the Museum of the Ptolemies, became the receptacle of the Alexandrian library, and the resort of men of letters. Here, as in a place of safety, Caracalla feasted his eyes with the massacre of the people of Alexandria; a circumstance which, added to many others, leads us to think that both the Serapéum and the Circus were situated in a suburb without the walls of the ancient city.^e

Reduced to a population of 16,000 souls, Alexandria before the French invasion carried on a trade in which the south of Europe had a considerable share. It was the medium of all the exchange of commodities that took place between Egypt and Constantinople, Leghorn, Venice, and Marseilles.

Near Aboukir, the roadstead of which makes so conspicuous a figure in history, the coast ceases to be composed of calcareous rocks; and the alluvial lands begin. The city of Rosetta is desecrated at a distance in the midst of groves of date trees, bananas, and syeamores. It is situated on the banks of the Nile, which annually washes, without injury, the walls of the houses. Its population, like that of Alexandria, progressively declines. The houses, though generally better built than those of Alexandria, are so crazy that they would go to ruin in a few months, if they were not favoured by a climate which destroys nothing. The stories projecting successively beyond one another, render the streets dark and dismal. An island in this part of the river, a league in length, presented to M. Denon the appearance of a most delicious garden,^f but is described by Hasselquist as an insupportable place, full of musquitos and buffalos.^g

From Rosetta to Damietta the low sandy coast was not long since infested by robbers, or occupied by rude shepherds and fishermen living without law. Lake Bourlous, filled with islets, extends over a part of this country. Bety, a town situated on the side of the lake, seems to correspond to the ancient Buto. Here a learned man, well versed in Egyptian antiquities, places Elearchia or Bucoliæ, that is, the country of marshes and of buffalo-herds.^h This district bore in the Egyptian language, the name of Bashmoor, which has also been given to the third dialect of

the ancient language of Egypt. The savage Bashmuriens lived sometimes in their boats, and sometimes among the reeds which covered their marshy shores. Such appears still to be the condition of the people who live round Lake Bourlos. The same picture is applicable to the neighbourhood of Lake Menzaleh, where Elearchia was placed by other writers.

All the country round Damietta is filled with large rice fields, on which great attention is bestowed. The rice of Damietta is the most esteemed of any in the Levant. But the city, which according to Binos contains 30,000, and according to Savary 80,000 souls, is very dirty, almost all the inhabitants delighting in the most filthy habits of living. Their health, especially that of the females, soon languishes, and multitudes, blind of one or both eyes, are met in every corner. This city, one of the keys of Egypt, carries on a great trade in rice and other provisions. It was built in 1250, five miles and a half^a south from the site of the ancient Thamiatis, which was destroyed in the time of the crusades.^b

The coast of the ancient eastern Delta is still lower and more marshy than that between Rosetta and Damietta. Menzaleh would not deserve particular attention, were it not for its very large lake, in the bosom of which are the islands of Matharyeh, which are very populous, and covered with houses, some of brick, and others of clay. In that which is called Myt-el-Matharyeh, the hovels of the people and the tombs of the dead form one promiscuous assemblage. The houses seem rather to be dens than human dwellings.

The fishermen of Matharyeh allow none of their neighbours to fish in the lake. Constantly naked, wading in the water, and engaged in their severe labours, they are hardy and vigorous, but almost perfect savages.

On the east side of the lake are the ruins of *Pelusium*; on the south side those of the ancient *Tanis*; and on an islet in the middle those of *Tennis*. Ascending higher in the province of Sharkieh, we find the sites of *Mendes* and of *Thmuis*, ancient cities now in ruins.

Lofty minarets point out from a distance the city of Mansoorah, famous for the battle fought under its walls in 1250, in which Louis IX. was taken prisoner. We have also Mit-Gamar on the Damietta branch of the Nile; Tell-Bastah on the canal of Moez; Belbeis on that of Menedjé; Salehieh, an important military post; and El-kankah, on the borders of the desert which lies between Cairo and the Red Sea. Having passed these different places we arrive at the point of the ancient Delta, forming now the small country of Kelyoûbéh,^c rich in grain, in pastures, and in different species of trees. Its villages are large, its flocks numerous, and its inhabitants peaceable and comparatively happy. To the north of Kelyoûbéh, the ground is intersected by an infinity of small canals for irrigation. The roads, though difficult, are very pleasant; several of them are skirted with rich gardens, others lead through thick groves and immense nurseries.

The interior of the modern Delta contains the large and populous city of Mehallet, surnamed el Kebir, or "the Great." Lucas, Sicard, and Pococke, considered it as, next

to Cairo, the most important in all Egypt.^d It is built of brick on a navigable canal, and surrounded with fertile fields always under crop. Aboosir, the ancient *Busires*, formerly occupied the central point of the Delta. Samannood, or Djemnooti, the ancient *Sebennytus*,^e a large town on the river of Damietta, is famous for producing numerous and excellent pigeons.

The city of Tentah is at present one of the most considerable places in the interior of the Delta. It is the resort of pilgrims from different parts of Egypt, Abyssinia, the Hedjaz, and the kingdom of Darfoor. The inhabitants estimate the annual number of these pilgrims at 150,000. The object of these meetings is to pay their respects at the tomb of a saint called Seyd Ahmed-el-Bedaoui. Commerce derives from them some advantages.^f Kenof^g is the capital of the smiling and fertile province of Menoofieh, which contains also the city of Shiquin-el-Koom.

In the north of the Delta we must take notice of the monastery of Saint Germinian, a place of pilgrimage both for Christians and Mahometans. The surrounding plains are covered with tents; horse races are held; wine and good living animate the pilgrims; the festival continues for eight days; it brings to the place a great number of dancing women, who contribute much to the pleasures of the occasion, pleasures which are kept up day and night. In this country, the night, being cooler than the day, is more favourable to amusements.

In the corner of the Delta, adjoining to Rosetta, amidst a great number of flourishing villages, and fields covered with excellent produce, we remark the towns of Berimbal and Fooah. This last was, in the sixteenth century, the seat of that trade which has since been transferred to Rosetta.

At the place where the canal of Alexandria joins the Nile, we find the large town of Rahmanie. On another canal is situated the small town of Damanhoor, a mart for the cottons produced in the neighbouring country, and a place where, in the time of the fairs, the coarse rejoicings of the peasantry sometimes remind the spectator of the noisy orgies of ancient Egypt. Terraneh, which derives prosperity from the natron trade, is situated on the western bank of the Nile, and above it Wardan, which is twenty-four hours distant from the port of Cairo.

At last the plain no longer displays its uniform luxuriance. Mount Mokattan raises on one side its arid head, on the other we find Djizeh, with its eternal pyramids. Opposite to these monuments, the eye descries in succession, on the eastern bank of the great river, the cities of Boolak, New Cairo, and Old Cairo.

Boolak^h is the port of Cairo, where the vessels lie that come from the lower part of the Nile. It extends along the banks, and exhibits all the bustle and confusion of commerce. In the harbour of Old Cairo the vessels lie that have arrived from Upper Egypt. Some of the most distinguished inhabitants of Cairo have here a sort of country seats, to which they retire during high Nile. Between these two cities is New Cairo, called by the orientals,

^a 2 French leagues.

Grand Cairo, by way of eminence. The name *Kaheerah*,^a signifies "the victorious." This city lying about a mile and a half from the Nile, extends to the mountains on the east, nearly three miles.^b It is surrounded by a stone wall, surmounted by fine battlements, and fortified with lofty towers at every hundred paces. There are three or four beautiful gates built by the Mamelukes, and uniting a simple style of architecture with an air of grandeur and magnificence. According to Abd-el-Rashid; El-Kaherah, or Cairo, was built in the 360th year of the hegira, the 970th of our common era, by the caliph Almanzor, (él-Moèz-le-Dym illah ébn él Manssour,) the first of the Fatimite caliphs who reigned over Egypt. This city was afterwards joined to that of Fostat, built also by the Arabians. Ssâlahh-éd-Dyn, or Saladin, about the year 572 of the hegira, (A. D. 1176,) built the ramparts with which it is surrounded, which are 18,116 yards^c in length. But in this vast extent we find only narrow and unpaved streets. The houses, like all others in Egypt, are badly built of earth or indifferent bricks, but differ from most others, in being, like those of Rosetta, two or three stories high. Being lighted only by windows looking into back courts or central squares, they appear from the street like so many prisons. The aspect of Cairo is a little relieved by a number of large but irregular public squares, and many fine mosques. That of sultan Hassan, built at the bottom of the mountain containing the citadel, is very large, and has the form of a parallelogram; a projecting cornice goes all the way round the top of the wall, adorned with sculptures which we call gothic, but which were introduced into Europe by the Spanish Arabians.

The inhabitants of Cairo, fond of shows like all the people of large cities, amuse themselves chiefly with feats of bodily exercise, such as leaping, rope dancing, and wrestling matches; also singing and dancing. They have buffoons, whose rude pleasantries and stale puns excite the ready laugh among an ignorant and corrupt people. The *almehs*, or female improvisatores, who amuse the rich with the exercise of their talent, differ from such as exhibit to the common people. They come to relieve the solitude of the harem, where they teach the women new tunes, and repeat poems which excite interest from the representations which they give of Egyptian manners. They initiate the Egyptian ladies in the mysteries of their art, and teach them to practise dances of rather an unbecoming character. Some of these improvisatrici have cultivated minds and an agreeable conversation, speaking their native language with purity. Their poetical habits make them familiar with the softest and best sounding expressions, and their recitations are made with considerable grace. The *almehs* are called in on all festive occasions. During meals they are seated in a sort of desk, where they sing. Then they come into the drawing room^d to perform their dances or pantomimic evolutions,^e of which love is generally the ground work. They now lay aside the veil, and along with it the modesty of their sex. They make their appearance clothed with a light transparent gauze, and the spirit

of the scene is kept up by tabors, castanets, and flutes. Thus we find, in all countries, dancing and music made subservient to voluptuous indulgence, and employed as the allies of licentiousness.

On the west bank of the Nile, we find the city of Djizeh, pleasantly shaded by sycamores, date trees, and olives. To the west of this city stand the three pyramids, which, by their unequalled size and celebrity, have eclipsed all those numerous structures of the same form which are scattered over Egypt. The height of the first, which is ascribed to Cheops, is 477 feet, that is forty feet higher than St. Peter's at Rome; and 133 higher than St. Paul's in London. The length of the base is 720 feet.^f The antiquity of these erections, and the purpose for which they were formed, have furnished matter of much ingenious conjecture and dispute, in the absence of certain information. It has been supposed that they were intended for scientific purposes, such as that of establishing the proper length of the cubit, of which they contain in breadth and height a certain number of multiples. They were, at all events, constructed on scientific principles, and give evidence of a certain progress in astronomy; for their sides are accurately adapted to the four cardinal points. Whether they were applied to sepulchral uses, and intended as sepulchral monuments, had been doubted; but the doubts have been dispelled by the recent discoveries made by means of laborious excavations. The drifting sand had, in the course of ages collected round their base to a considerable height, and had raised the general surface of the country above the level which it had when they were constructed. The entrance to the chambers had also been, in the finishing, shut up with large stones, and built round so as to be uniform with the rest of the exterior. The largest, called the pyramid of Cheops, had been opened, and some chambers discovered in it, but not to so low as the base, till Mr. Davison, British consul at Algiers, explored it in 1763, when accompanying Mr. Wortley Montague to Egypt. He discovered a room before unknown, and descended the three successive wells to a depth of 155 feet.^g Captain Caviglia, master of a merchant vessel, has lately pursued the principal oblique passage 200 feet farther down than any former explorer, and found it communicating with the bottom of the well. This circumstance creating a circulation of air, he proceeded twenty-eight feet farther and found a spacious room sixty-six feet by twenty-seven, but of unequal height, under the centre of the pyramid, supposed by Mr. Salt to have been the place for containing the *theca*, or sarcophagus, though now none is found in it. The room is thirty feet above the level of the Nile. The upper chamber, 35½ feet by 17¼, and 18½ high, still contains a sarcophagus. Herodotus erred in supposing that the water of the Nile could ever surround the tomb of Cheops. In six pyramids which have been opened, the principal passage preserves the same inclination of 26° to the horizon, being directed to the polar star. M. Belzoni, after some acute observations on the appearances connected with the second pyramid, or that of Cephrenes, succeed

^a "El Qâhirah." ^b Nearly 5 kilometers, or 21 2-3 furlongs.

^c 29,300 cubits or 8500 toises French measure.

^d "Salle du festin."

^e "Ballets-pantomimes."

^f These measures differ from those in the original. "The largest pyramid, (Description des pyramides de Ghizeh, par le Colonel Grobert,) is 474 $\frac{1}{6}$ $\frac{2}{3}$ [French] feet perpendicular height, and the length of its base on the present surface is 716 feet 6 inches; but with its ancient coating, [this is denied by Belzoni,] the height of its summit, (ter-

minating in a point,) must have been 505 $\frac{3}{8}$ $\frac{6}{8}$ $\frac{9}{8}$ feet, and the length of its base 734 feet 6 inches." In the English edition, the height is given 447 feet. I have taken 477 from the Ed. Encyc. where it is compared with St. Peter's and St. Paul's, in the same proportions. Now, the height of St. Peter's is 437 feet, and that of St. Paul's 344 feet; consequently 447 feet must be an error.—P.

PLATE 250. 44

ed in opening it. The stones, which had constituted the coating, (by which the sides of most of the pyramids which now rise in steps had been formed into plain and smooth surfaces,) lay in a state of compact and ponderous rubbish, presenting a formidable obstruction; but somewhat looser in the centre of the front, showing traces of operations for exploring it, in an age posterior to the erection. On the east side of the pyramid he discovered the foundation of a large temple, connected with a portico appearing above ground, which had induced him to explore that part. Between this and the pyramid, from which it was fifty feet distant, a way was cleared through rubbish forty feet in height, and a pavement was found at the bottom, which is supposed to extend quite round the pyramid; but there was no appearance of any entrance. On the north side, though the same general appearance presented itself after the rubbish was cleared away, one of the stones, though nicely adapted to its place, was discovered to be loose; and when it was removed, a hollow passage was found, evidently forced by some former enterprising explorer, and rendered dangerous by the rubbish which fell from the roof; it was therefore abandoned. Reasoning by analogy from the entrance of the first pyramid, which is to the east of the centre on the north side, he explored in that situation, and found at a distance of thirty feet the true entrance. After incredible perseverance and labour, he found numerous passages all cut out of the solid rock, and a chamber forty-six feet three inches by sixteen feet three, and twenty-three feet six inches high, containing a sarcophagus in a corner, surrounded by large blocks of granite. When opened, after great labour, this was found to contain bones, which mouldered down when touched, and, from specimens afterwards examined, turned out to be bones of an ox. Human bones were also found in the same place. An Arabic inscription, made with charcoal, was on the wall, signifying that "the place had been opened by Mohammed Ahmed, lapicide, attended by the Master Othman, and the King Alij Mohammed," supposed to be the Ottoman emperor, Mahomet I. in the beginning of the fifteenth century. It was observed, that the rock surrounding the pyramid on the north and west sides, was on a level with the upper part of the chamber. It is evidently cut away all round, and the stones taken from it were most probably applied to the erection of the pyramid. There are many places in the neighbourhood where the rock has been evidently quarried, so that there is no foundation for the opinion formerly common, and given by Herodotus, that the stones had been brought from the east side of the Nile, which is only probable as applied to the granite brought from Syene. The operations of Belzoni have thrown light on the manner in which the pyramids were constructed, as well as the purpose for which they were intended. That they were meant for sepulchres cannot admit of a doubt. Their obliquity is so adjusted as to make the north side coincide with the obliquity of the sun's rays at the summer solstice. The Egyptians connected astronomy with their religious ceremonies, and their funerals; for zodiacs are found even in their tombs. It is remarkable that no hieroglyphical inscriptions are found in or about the pyramids as in the other tombs, a circumstance which

is supposed to indicate the period of their construction to have been prior to the invention of that mode of writing; though some think that the difference may be accounted for by a difference in the usages of different places and ages. Belzoni, however, says that he found some hieroglyphics in one of the blocks forming a mausoleum to the west of the first pyramid. The first pyramid seems never to have been coated, and there is not the slightest mark of any coating. The second pyramid showed that the coating had been executed from the summit downward, as it appeared that it had not in this instance been finished to the bottom.^a—The following are the dimensions of the second pyramid: The basis, 684 feet; the central line down the front from the apex to the basis, 568; the perpendicular, 456; coating from the top to where it ends, 140.^b These dimensions being considerably greater than those usually assigned even to the first or largest pyramid, are to be accounted for by those of Belzoni being taken from the base as cleared from sand and rubbish, while the measurements of the first pyramid given by others, only applied to it as measured from the level of the surrounding sand.

The largest of the numberless sphinxes found in Egypt, is in the neighbourhood of the pyramids of Djizeh; it was, at an expense of 800*l.* or 900*l.*, (contributed by some European gentlemen,) cleared from the accumulated sand in front of it under the superintendance of Captain Caviglia. This monstrous production consists of a virgin's head, joined to the body of a quadruped. The body is principally formed out of the solid rock; the paws are of masonry, extending forward fifty feet from the body; between the paws are several sculptured tablets so arranged as to form a small temple; and farther forward a square altar with horns.

Ascending the Nile we come to Sakhara, near which are many pyramids, some of them formed of brick. They are dispersed over a line of eleven miles,^c and are known by the name of the pyramids of Aboosir.^d At the foot of this chain of mausolea, lay the ancient Memphis, which has left some of the rubbish of its immense buildings at Mitrahenuo,^e and probably extending to Mohannan.^f The inhabitants carry on a traffic in mummies, the embalmed bodies of men and of sacred animals found in the excavations of the rocks. On the eastern bank is seen the famous mosque called Atsar-en-Neby, which is much frequented by the mussulmans of Cairo, who perform a pilgrimage to pay their respects to a stone marked with a perfect impression of the feet of the prophet. It is covered with a very rich veil, which the priests of the mosque raise only for the gratification of those true believers who evince their piety by means of certain offerings. Atfieh, the capital of the province of Atfieheli, is situated on the east bank, as Savary has observed, in opposition to the greater part of geographers.

At a distance of fifteen miles to the west of the Nile, the mountains open to form a valley leading into the Fai-oom, the ancient province of *Arsinoë*. The Bahr Yoosef coming from the Nile, passes through the centre of the valley in various serpentine turns till it reaches the Fai-oom. In the north part of this extensive and fine district is lake Mœris, round which the soil is barren and wild:

^a Belzoni's Narrative of Operations and recent Discoveries in Egypt and Nubia, second edition, vol. I. p. 395. 425.

^e Mitrahénue.

^f Compare Pococke, Description, I. p. 39—293. D'Anville, Mémoires, p. 136. Larcher, Herodotus, II. 362—366.

This lake, which is now called Caroon, is much inferior in size to what it was in ancient times, when described with enthusiasm by Strabo, as resembling the sea in its extent, in the colour of its water, and in the nature of the surrounding shores; but it is still about thirty leagues in circumference, its length being between thirty and forty miles, and its greatest breadth about six.^a Its shore towards the Faïoom is flat and sandy. The water of the lake has a slight saline impregnation, but is very well fitted for human use. It contains some fish, and thus supports a few fishermen who send the fish to be sold in the different towns.

This lake has been believed to have been an artificial excavation executed by Mœris, an ancient King of Egypt, who most probably only formed the canal by which it is filled from the Nile. Belzoni thinks that the water was retained by a dam at its place of entrance, and a second irrigation thus produced. This at least is considered by that traveller as the only way in which it could have been rendered subservient to agriculture, and thus it would resemble the artificial tanks which at present abound in India, but to the first irrigation itself the canal was necessary.^b This canal, however, has been much neglected, and the depositions of earth brought by the Nile have elevated the surface of the whole Faïoom, which, though displaying traces of its former fertility, has by the circumstances now specified, and the encroachments of the sand of the desert, been reduced to one third of its former extent. All the villages in it, except four, pay a fixed *miri*, independent of what is due at the rise of the Nile. This financial arrangement must be very ancient, and appears to have been established in consequence of the great expense at which the kings of Egypt had rendered this country habitable. At the entrance of the Faïoom is the town of Medineh, or Medinet-el-Faïoom, (the word Medineh signifying "the City;") near to which are the ruins of the ancient *Arsinoë*. These ruins contain granite columns which are only found in this place and at the pyramids, and many of them are seen among the materials of which the town of Medineh is built. In this town there are manufactures of linen, cotton, and woollen stuffs; of oil and rose water. The last article supplies the immense consumption which takes place among the great people, who keep their divans covered with it, and are in the habit of offering it to strangers. Wines also are made, but much inferior to those formerly produced in this Arsinoitic district. In this district was situated the Labyrinth so celebrated in antiquity, consisting of 3000 chambers, one half above ground, and the other half below. These have left no corresponding marks, at least none visible above ground, to render its exact situation certain. It is generally supposed to have been in the place where the ruins of the town and palace of Caroon are now found, about three miles from the western extremity of the lake. Here are to be seen the remains of a town wall, fragments of columns, and blocks of stone of middling size. The town is a mile in circumference. In the middle is the temple, which is in tolerable preservation, and is of a singular construction, different from the Egyptian, having probably been at some period altered or rebuilt. It contains no hieroglyphics. Mr. Belzoni did not believe this to be the situation of the labyrinth. That traveller visited some other

ruins of ancient Greek towns, situated in the same neighbourhood. He found among the blocks some fragments of Grecian statues and other specimens of sculpture. When the sand is removed the roofs of habitations are found, with their wooden materials in a state of preservation. This traveller thinks that the remains of the labyrinth might perhaps be discovered if it were practicable to remove the sand, but at the same time states that several ancient remains are beneath the present level of the water, that many of them must be now deeply covered by the annually accumulating depositions from the waters of the Nile, brought by the canal of Joseph, and that the celebrated labyrinth may possibly be utterly out of the reach of discovery.^c All along the west side of the lake, this traveller found a great number of stones, and columns of beautiful colours, of white marble and of granite. The Faïoom contains a town called Fedmin-el-Kumois, or "the Place of Churches," from a tradition that it once consisted of 300 Christian churches, which the Mahometans converted into a town. One part of it is inhabited by Mahometans, and the other by Copts, who live on very tolerant terms with one another; but the latter are poor, and destitute of the means of educating their children.

Vostani, or Middle Egypt, contains also Benisooef, where there is a manufacture of coarse carpeting; Minieh, the capital of a province, the territory of which is elevated above the adjoining lands; Ansana, or Ensineh, where the statues found among the ruins of Antinopolis have given rise to a notion among the Arabs that human bodies had been petrified;^d Mellavi, a prettily situated town, which annually exports 400,000 sacks of wheat; and Momfaloot, known for its manufactures.

At the town of Sahoodi is the beginning of the caverns of the Thebaid. These are quarry holes, to which the anchorites, in the first ages of Christianity, retired. They extend through a space of fifty-six miles;^e and the hieroglyphics found in them prove them to have been the work of the Egyptians, who took their marble from this place at a very remote period.

The grottos, near the city of Sioot, contain very curious antique paintings in a good state of preservation. The city, one of the largest in the Saïd, is the resort of the caravans of Nubia. Its vicinity, and that of Abootishe, produce the best opium.^f

Among other villages, we remark on the east bank Gau-Shenkieh, which has succeeded to Antæopolis. Here was a magnificent temple in honour of Antæus. The porch still remains, which is supported, according to Norden, by columns, and which appears to be of one stone, sixty paces in length, and forty in breadth. This splendid work now forms the entrance of a stable, where the Turks keep their flocks.

Akmin,^g the residence of an Arab prince, has succeeded to the ancient *Chemmis* or *Panopolis*. The ruins of the ancient city are found on the outside of the present town. Abulfeda mentions a temple built of stones of astonishing size, which he ranks among the most celebrated ancient monuments. Mere fragments, however, are all that now remain. The modern town is handsome, very commercial, and has manufactures of cotton cloth and of pottery. It

^g "Akhmym," Ekmin.

has a regular and strict police, and its territory is fertile in all sorts of produce.

Opposite to Akmin, on the west bank of the river, is the large town of Meshieh.^a Here all the boats which go from Cairo to the cataracts, or from the cataracts to Cairo, stop to take in provisions, which are plenty and cheap.

Seventeen miles^b to the south-east of Meshieh, we find Djirdjeh,^c the capital of Upper Egypt, lately the residence of a Bey, and the seat of a Coptic bishop. The city is modern, and owes its origin and name to a convent dedicated to St. George.^d It has public buildings and squares, but no monuments. It is a place of trade and industry, and the territory belonging to it is fertile.

Denderah is a place of little consequence in itself, but travellers visit it with great interest on account of a great quantity of magnificent ruins found three miles^e to the west of it. Bruce, Norden, and Savary, agree in identifying them with the ancient *Tentyra*.

The remains of three temples still exist. The largest is in a singularly good state of preservation, and the enormous masses of stone employed in it, are so disposed as to exhibit every where the most just proportions. It is the first and most magnificent Egyptian temple to be seen in ascending the Nile, and is considered by Mr. Belzoni as of a much later date than any of the others. From the superiority of the workmanship, he inclines to attribute it to the first Ptolemy, the same who laid the foundation of the Alexandrian library, and instituted the philosophical society of the Musæum. Here, Denon thought himself in the sanctuary of the arts and sciences. The columns which form the portico are twenty-four in number, divided into four rows. Within the gate, the square is surrounded with columns with square capitals; the shafts and every part of the wall are closely covered with hieroglyphics and figures in basso-relievo. On each side there is a colossal head of the goddess Isis, with cow's ears, with a simple and almost smiling expression. The ceiling contains the zodiac, inclosed by two female figures, which extend from one side of it to the other. The walls are divided into several square compartments, each containing figures of deities, and priests in the act of offering, or immolating victims. On the top of the temple the Arabs had built a village which is now deserted and in ruins.^f

As for the zodiacs or celestial planispheres found here, and their high antiquity so much boasted of, an able antiquary has shown that they could not have been prior to the conquest of Alexander.^g ^h

From Djirdjeh to Thebes, the Nile forms a great bending to the east. At the elbow nearest to the Red Sea, stands Kenneh,ⁱ the ancient *Cenopozis*, a town which once carried on an active commerce with Cosseir. According to Irwin, an English traveller, this city, which is still of considerable size, retains traces of many ancient customs. In the funeral processions, the women dance to the sound of dolorous music, and utter hideous cries. The festivals here, as in the Saïd in general, are held during the night,

and on the river. They are concluded with a spectacle, partaking of a mythological character. The dancing women plunge almost naked into the water, where they swim about like so many nymphs or naiads.^k

Keft seems to be the port of the ancient city of Kopt or Koptos, from which, according to some authors, the Copts derive their name.^l In all that country the inhabitants manufacture vessels of light and porous clay, which by allowing the water slowly to transude so as to keep up an external evaporation, communicate a refreshing coolness to that which remains. These are used through the whole of Egypt.

The village of Luxor, that of Karnak, and some others on the eastern bank, contain more ruins. The case is the same with the western side. Savary, Bruce, Norden, Browne, and Denon, concur in speaking with admiration of the ancient ruins of these places. New researches have proved that they belong to ancient Thebes, the city with a hundred gates, known to Homer, and which was 400 Egyptian stadia in circumference.^m Diodorus, who speaks of Thebes as of a city already in ruins, takes particular notice of four principal temples. He speaks of sphinxes, colossal figures decorating the entrances, porticoes, pyramidal gateways, and stones of astonishing magnitude which entered into their structure. In the descriptions given by the travellers now mentioned, and by others who preceded them, these monuments cannot be mistaken. Browne tells us, that "there remain four immense temples, yet not so magnificent nor in so good a state of preservation as those of Denderah." "It is surprising," says Norden, "how well the gilding, the ultramarine, and various other colours, still preserve their brilliancy." He speaks also of a colonnade of which thirty-two columns are still standing, of ceilings, galleries, and other remains of antiquity, which he has represented in his plates, and which he thinks the more worthy of attention that they appear to be the same that are mentioned by Philostratus in his account of the temple of Memnon.

No description can give an adequate idea of these wonders of antiquity, both in regard to their incredible number and their gigantic size. Their form, proportions, and construction, are almost as astonishing as their magnitude. The forests of enormous columns, towering high above the palm trees of the country, with their capitals gracefully adorned with the *lotus*, and the shafts covered with ornamental figures, the avenues of sphinxes miles in length, the colossi placed at the numberless gates, all produce a most bewildering impression on the mind of the admiring traveller. The temple of Tentyra, being in high preservation, pleases by the beauty of its workmanship and sculpture; but at Thebes the mind is lost in a mass of colossal objects, every one of which is more than sufficient to absorb its whole attention. On the east side of the Nile, at Karnak, and Luxor, amidst the multitude of the temples there are no tombs; these are confined to the west bank. An iron sickle was lately found under one of the buried statues nearly of the shape of those which are now in use,

though thicker ; it is supposed to have lain there since the invasion of Cambyses, when the idols were concealed by the superstitious to save them from destruction. Mr. Belzoni, and others, have been busily employed in uncovering and carrying away specimens of these antique remains, such as sphinxes, obelisks, and statues. On the west side of the river, at Goornoo, Medinet Aboo, and Beban-el-Malook, are numberless tombs in the form of subterranean excavations, and containing many human bodies in the state of mummies, sometimes accompanied with pieces of papyrus, and other ancient curiosities. These have been the subjects of ardent research ; and the trade of digging for tombs and mummies being found gainful, has been resorted to by numerous Arabs belonging to the place. The tombs and mummies of persons of condition are easily distinguished from those of the common people, by the care and expense displayed in preparing them ; and from the state in which they are found many interesting conclusions are drawn illustrative of the manners and customs of the ancient Egyptians, who employed their wealth in nothing more lavishly than in their mode of disposing of the bodies of their deceased kindred.

On the east side of the river, no palaces or traces of ancient human habitations are met with ; but at Medinet Aboo there are not only *Propylææ*, and temples highly valued by the antiquarian, but dwelling houses which seem to point out that place to have been once a royal residence. Mr. Belzoni found at Goornoo the ruins of a temple with octagonal columns abounding in hieroglyphics, yet so completely unique in its style, that he was led to consider it as of later date than the works of the ancient Egyptians.

With respect to the mummies, some are found in wooden cases shaped like the human body. These belonged to persons superior to the lowest rank, but differing from one another in the quantity and quality of the linen in which the body had been wrapped. The mummies of the poorest classes are found without any wooden covering, and wrapped in the coarsest linen. These differ from the former also in being often accompanied with pieces of papyrus, on which Belzoni supposes that an account of the lives of the deceased had been written, while a similar account was carved on the *cases* of the more opulent. The cases are generally of Egyptian sycamore, but very different from one another with respect to plainness or ornament. Sometimes there are one or two inner cases, besides the outer one. Leaves and flowers of acacia are often found round the body, and sometimes lumps of asphaltum, as much as two pounds in weight. The case is covered with a cement resembling plaster of Paris, in which various figures are cast. The whole is painted, generally with a yellow ground, on which are hieroglyphics and figures of green. The tombs of the better classes are highly magnificent, consisting of different apartments adorned with figures representing the different actions of life, such as agricultural operations, religious ceremonies, feasts, and funeral processions, these last being generally predominant. Their paintings, which are described by Mr. Hamilton, contain numerous articles illustrating the domestic habits of the Egyptians. Small idols are found lying about, and sometimes vases containing the intestines of the mummies, generally of baked clay painted, some few of alabaster ; there is much pottery

besides, and many wooden vessels. Mr. Belzoni found some leaf-gold beaten nearly as thin as ours. No instruments of war are found in these places. This gentleman only found an arrow with a copper point, well fixed in one end, while the other end had a notch. Figures of the scarabæus or beetle, a highly sacred animal among the Egyptians, are sometimes found executed in alabaster, verde antico, and other materials.

From the garments in which the mummies are sometimes wrapped, it appears that linen manufactures were brought to equal perfection among the ancient Egyptians as they are now among us.^a They understood the tanning of leather, of which some shoes are found. Some of the leather is stained with various colours, and embossed. The art of gilding is proved to have existed among them in a state of great perfection. They knew how to cast copper, as well as how to form it into sheets. A few specimens of varnishing are found, which show that this art, and the baking of the varnish on clay, were in such perfection, that it appears doubtful whether it could now be any where imitated. In the art of painting, they were a little behind in not giving their figures relief by shading ; but their colours, particularly the red and green, are well disposed, and produce a splendid effect, especially by candle light.^b Their drawings are always in profile. Some drawings are found preparatory to sculpturing on the walls, and others in different stages of their execution. Mr. Belzoni observed some drawings executed by learners, and afterwards corrected in faulty places by a master with a different coloured chalk. This gentleman saw in some brick buildings of the highest antiquity, evidences that the Egyptians understood the building of arches with the keystone, though their predilection for numerous columns in the construction of their large temples led them in these buildings to neglect the arch.^c Their sculptures are executed in four kinds of stone ; sandstone which is comparatively soft, a hard calcareous stone, breccia, and granite. This last is more finely polished than it could be by our present tools.

The Arabs of Goornoo lead the lives of troglodytes in the entrance of the tombs, where they choose a place of convenient dimensions, and shut up the entrance between them and the tomb with clay, leaving only a hole to creep through. Here their sheep, as well as themselves, are housed. They use lamps of sheep's tallow : the walls are black like chimneys, and human bones and pieces of mummies lie every where about them unheeded. They live almost naked, their children entirely so. They are oppressed and prevented from accumulating wealth, yet are reconciled by custom to their situation, and on the whole happy. Their women are very ambitious of such jewellery as beads, coral, and pieces of coin, and look down with pity on those who have none. A mat, a few earthen pots, and a grinding stone, are all the household furniture they require. They are exceedingly expert in the art of cheating strangers, which constitutes the height of their virtue and a great part of their industry.^d The researches of Mr. Belzoni have had the effect of enriching the British Museum with some interesting specimens of Egyptian antiquity, among which are a fine obelisk from the island of Philæ, and a colossal bust called younger Memnon. The model which he has made of an Egyptian tomb is par-

ticularly gratifying to antiquarian curiosity. While he was in Egypt, he made moulds of every individual sculptured figure, and other objects in the tomb, and a tomb is built on the same scale as the original, with *fac similes* of all its contents executed with correctness in form, relief, and colouring. It is seen by candle light, and gives precisely the same effect with the original excavation.

The ancient Hermonthis is represented by the village of Erment. In its vicinity is to be seen a large temple in a very good state of preservation, and the paintings of which represent, among other animals, the giraffe, an animal at present unknown in Egypt.^a A learned discussion has recently confirmed D'Anville's conjecture, according to which the ancient Latopolis corresponds to the modern town of Esneh,^{b c} where a temple of very high antiquity is found. This town, situated on elevated ground, where vegetation is supported by artificial irrigation, was enriched by the residence of some Mameluke beys, who spent there the money which they extorted from the cultivators of the neighbourhood. Esneh displays more luxury, and a more refined industry, than the other towns of Upper Egypt. Among other things, a great quantity of very fine cotton stuffs, and shawls called Malayéh, much used in Egypt, are manufactured here. The caravan from Senaar brings hither also the different articles of its commerce, particularly gum arabic, ostrich feathers, and ivory. Wood in this place is extremely rare.

Esneh is the last large town in Egypt. But higher up we find some interesting ruins. At Elethya there are two caverns, containing a great number of paintings, representing the customs and occupations of the ancient Egyptians, and particularly the various forms of ploughs, and other agricultural implements.^d At Edfoo is a large temple, the corridors and mysterious passages of which are still to be seen. At an elbow of the Nile, forming a harbour, we find the ruins of *Ombos* on a hill called Koom-Ombo. In the great temple, some paintings which have not been finished show that the Egyptians employed in their drawings the same geometrical methods with the moderns. They divided the surface into small squares,—a method which they also no doubt employed in geography.^e

Near Assooan are found the remains of the ancient *Syene*, consisting of some granite columns, and an old square building, with openings at top. The researches made here have not confirmed the conjecture of Savary, who conceived it to be the ancient observatory of the Egyptians, where, with some digging, the ancient well might be found, at the bottom of which the image of the sun was reflected entire on the day of the summer solstice. The observation of the French astronomers place Assooan in lat. $24^{\circ} 5' 23''$ of north latitude. If this place was formerly situated under the tropic, the position of the earth must be a little altered, and the obliquity of the ecliptic diminished. But we should be aware of the vagueness of the observations made by the ancients, which have conferred so much celebrity on these places. The phenomenon of the extinction of the shadow, whether within a deep pit, or round a perpendicular gnomon, is not confined to one exact mathematical position of the sun, but is common to a certain ex-

tent of latitude corresponding to the visible diameter of that luminary, which is more than half a degree. It would be sufficient, therefore, that the northern margin of the sun's disc should reach the zenith of Syene on the day of the summer solstice, to abolish all lateral shadow of a perpendicular object. Now, in the second century, the obliquity of the ecliptic, reckoned from the observations of Hipparchus, was $23^{\circ} 49' 25''$. If we add the semidiameter of the sun, which is $15' 57''$, we find for the northern margin $24^{\circ} 5' 22''$, which is within a second of the actual latitude of Syene. At present, when the obliquity of the ecliptic is $23^{\circ} 28'$ the northern limb of the sun comes no nearer the latitude of Syene than $21' 3''$, yet the shadow is scarcely perceptible. We have, therefore, no imperious reason for admitting a greater diminution in the obliquity of the ecliptic than that which is shown by real astronomical observations of the most exact and authentic kind. That of the well of Syene is not among the number of these last, and can give us no assistance in ascertaining the position of the tropic thirty centuries ago, as some respectable men of science seem to have believed.^f

Syene, which, under so many different masters, has been the southern frontier of Egypt, presents in a greater degree than any other spot on the surface of the globe, that confused mixture of monuments which, even in the destinies of the most potent nations, reminds us of human instability. Here the Pharaohs and the Ptolemies raised the temples and the palaces which are found half buried under the drifting sand. Here are forts and walls built by the Romans and the Arabians, and on the remains of all these buildings French inscriptions are found, attesting that the warriors and the learned men of modern Europe pitched their tents, and erected their observatories on this spot. But the eternal power of nature presents a still more magnificent spectacle. Here are the terraces of reddish granite of a particular character,^g hence called Syenite, a term applied to those rocks which differ from granite in containing particles of hornblende. These terraces, rising perpendicularly, cross the bed of the Nile, and over them the river rolls majestically his impetuous foaming waves. Here are the quarries from which the obelisks and colossal statues of the Egyptian temples were dug. An obelisk, partially formed, and still remaining attached to the native rock, bears testimony to the laborious and patient efforts of human art. On the polished surfaces of these rocks hieroglyphic sculptures represent the Egyptian deities, together with the sacrifices and offerings of this nation, which more than any other has identified itself with the country which it inhabited, and has in the most literal sense engraved the records of its glory on the terrestrial globe:

In the midst of this valley, generally skirted with arid rocks, a series of sweet delicious islands covered with palms, date trees, mulberries, acacias and napecas, has merited the appellation of "the Tropical Gardens." The one called El-Sag, opposite to Syene, is the *Elephantina* of the ancients; while the ancient *Phila* is recognized in the El-Heif of the moderns. Both of them, especially the latter, filled with beautiful remains of temples, quays, and other

monuments,^a attest the ancient civilization of which they must have been the seat.

It is probable that the two names of *Philæ* and *Elephantine* were originally one, for *Fil* in the Oriental languages, signifies an elephant, and these islands, fertilized by the deposited slime of the river Nile, must, in ancient times, have attracted elephants by their rich vegetation. This ingenious conjecture explains the reason why Herodotus has not named *Philæ* in describing *Elephantine*,^b so as to give the idea that he placed it to the south of the first cataract. It explains the possibility of a former kingdom of Elephantine, a kingdom which could not be confined to a single island 1400 yards^c long and 400 broad. Julius Africanus bears testimony to its existence and duration. The Augustine history^d speaks of a king of Thebes, an ally of Zenobia. These facts, taken altogether, show that the narrow valley of Upper Egypt has, in all ages, been the treat of small and almost independent states.

From the ever memorable scenes of the valley of the Nile, we cross narrow gorges and sterile plains covered with sand, bordered by naked rocks, where even the serpent and the lizard cannot find subsistence, and where no bird dares to extend his flight,—and arrive at the no less arid shores of the Red Sea. The coasts of this sea are rich in coral, madrepores, and sea sponges. Among the reefs of coral is found the port of Cosseir. The town of this name is only a collection of old houses, and large storehouses occupied from time to time by the caravans, but without any fixed inhabitants. It labours under a want of fresh water, and the only produce of the vicinity is the coloquintida.^e

But the vast desert of the Thebaid, lying between this portion of the valley of the Nile and the Red Sea, is not equally sterile in every part. Mr. Irwin, who travelled from Kenneh to Cairo by a route which passes obliquely the northern part of this desert, found, by the sides of frightful ravines and black chasms, some valleys in which acacia bushes, covered with white and fragrant blossoms, furnished a delightful shade to the timid antelope. Some tufts of wild wheat, a date tree, a well, and a grotto, called to mind the old anchorets, who chose in these solitudes to relinquish their intercourse with a perverse world. Two similar verdant spots near the shores of the Red Sea, somewhat nearer to Suez than Cosseir, contain the monasteries of St. Anthony and St. Paul, surrounded with handsome orchards of date trees, olives, and apricots. The first of these convents has a vineyard which produces good white wine.^f

A route somewhat less gloomy leads from Cairo to Suez, a town situated on the isthmus of that name. The port of Suez has only a bad quay at which small boats can scarcely land at high water, while the vessels lie at anchor in the roads. The only supply of water that the inhabitants have is one brackish spring. The sea abounds in fish, but they are neglected by the people. All the necessaries of life are wanting in this wretched place, which is situated in a parched sandy plain, about a league from the roadstead. The fortress is of a piece with the town, consisting of some towers in a half ruinous condition.

In the most southerly part of this desert, about the latitude of Assouan or Syene, is the site of the ancient city of Berenice, delightfully situated in a plain almost surrounded by mountains, at a distance of five miles. Its ruins are still perceptible, even to the arrangement of the streets, and in the centre is a small Egyptian temple, which, as well as the insides of the houses, is nearly covered by the sand. The temple is built of soft calcareous stone, and sandstone. Mr. Belzoni found it adorned with Egyptian sculpture, well executed in basso-relievo, and carried away a tablet of breccia covered with hieroglyphics and figures. The soil of the plain is sandy, but appears susceptible of cultivation for pasture and other purposes. It contains some bushes which make good firewood. Mr. Belzoni calculated from the apparent extent of the ruins and the size of the houses, that this seaport had contained a population exceeding 10,000. It has a fine harbour with a northern entrance entirely formed by nature.

Not far from this place are the famous mountains of emeralds, the highest of which is called Zubarah, and which were visited by Mr. Bruce and Mr. Belzoni. The present Pasha of Egypt made an attempt to work the emerald mines, and had about fifty men employed as miners in the year 1818, but the mines appear to have been exhausted by the ancients. The miners were exposed to great inconvenience and risk, being supplied with all their food by caravans from the Nile, at a distance of seven days' journey. From the negligence of the purveyors it was often late in arriving; and the caravans were liable to be interrupted by the inhabitants of the desert. These miners sometimes rose against their leaders and killed them. The old excavations consisted of low galleries much obstructed with rubbish, and rendered dangerous by the looseness of the roof. The passages went very far into the mountain, along the strata of mica and of marble, and emeralds were found at a great distance from the surface, and chiefly at the place where two marble strata inclosing the mica between them, met one another.

The deserts of eastern Egypt are inhabited by some tribes of Arabs, who call themselves its sovereigns. Those who occupy the countries between the isthmus and the valley of Cosseir, receive the general name of Atonis, or Antoonis, which to us seems a corruption of that of Saint Antony, which was given to a part of these deserts. The tribes whose real names are known, are the Hooatal, who occupy the isthmus and the vicinity of Suez; the Mahazeh, who live about the latitudes of Benisooef and the monastery of St. Antony; and the Beni-Wassel who live in the latitude of Monfaloot and Minieh. All these Arabs are enemies to the Ababdeh, who rule over all the deserts from Cosseir to a distant part of Nubia.

In the topography of Egypt we must include the *oases*, which have always formed part of this kingdom. Strabo gives an excellent definition of the word *oases*. "This," says he, "is the name given in the language of the Egyptians, to inhabited cantons, which are entirely surrounded by vast deserts, in which they resemble so many islands in the midst of the ocean." The Arabs call them *Ooâhh*,^g and

in a Coptic dictionary in the royal library of Paris, we are told that, in the Coptic language, this word signifies an inhabited place.^a There are three to the west of Egypt to which this name is particularly applied. The term oâsis is somewhat ambiguous from being indiscriminately used to signify either one of these islands, or a collection of them.

The great and the small oâsis of the ancients are each composed of a certain number of spots generally separated by spaces larger than their own diameters. These places have, like Egypt itself, been described in very opposite colours by different writers. The Greeks called them "the islands of the blessed," (*Μακαρων νησοί,*) and they certainly appear delightful in the eyes of the traveller who has for days been traversing the parched and sterile desert. But the inhabitants of extensive cultivated countries have habitually viewed them with horror. They were often assigned as places of banishment. They have, for the most part, been described by grave writers in terms unusually poetic, and leaning to the lively or the dismal according to the prevailing bent of the respective authors. Even the physical delineations of them have often laboured under essential errors. Their physical character, as distinguished from the surrounding deserts, is chiefly derived from subterranean springs, by means of which vegetation is created and maintained, and a vegetable mould formed. The springs are accounted for by the high lands with which these oâses are universally surrounded. Wells are often dug to a depth of 300 and sometimes 500 feet, and the water is drawn up from them for irrigation. M. Maillet, in describing these spots, allows his imagination to be so far deceived by what he knew of the Faïoom, as to say that these oâses are watered by canals connected with the Nile. Their fertility has always been deservedly celebrated. Strabo mentions the superiority of their wine; Abulfeda and Edrisi, the luxuriance of the palm-trees; and Vansleb, the Dominican traveller, states that they exported sweeter and finer dried dates than were to be found any where else. Sir Archibald Edmonstone states that, in one of them, he passed through a beautiful wood of acacias far exceeding in size any he had ever seen, the trunks of some of them measuring more than seventeen feet in circumference.^b

The Great Oâsis, which is most to the south and the east, is formed of a number of fertile isolated spots, which lie in a line parallel to the course of the Nile, and to the mountains which bound the valley of Egypt on the west. These patches of fertile land are separated from one another by deserts of twelve or fourteen hours journey; so that the whole extent of this oâsis is nearly 100 miles,^c the greater proportion consisting of a desert. M. Poncet visited it in 1698. He says it contains many gardens watered with rivulets, and that its palm groves exhibit a perpetual verdure. According to a more recent account, it contains Egyptian ruins covered with hieroglyphic inscriptions.^d The principal town is called El-Kargeh. Here are the remains of a temple, beautifully situated in the midst of a rich grove of palm trees.^e The temple stands east and west, and a rich cornice runs all round the top. The front is covered with colossal figures and hieroglyphics.

There are several chambers still entire, containing hieroglyphics in stucco, with marks of red and blue paint; but the roof of a great part has fallen in. It seems to have been protected by a triple wall; each wall had its propylon or door way, and these are all standing. One of the *propyla* is covered over with a Greek inscription, consisting of a long rescript, published in the reign of Galba, respecting a reform in the administration of justice in this and other Egyptian territories.^f

Near El-Kargeh there is also a regular Necropolis, or cemetery, containing 200 or 300 buildings of unburned brick, chiefly of a square shape, and each surmounted by a dome similar to the small mosques erected over the graves of sheiks. One of them is divided into aisles, and has been used at one time as a Christian church, as appears from the traces of saints painted on the wall. Sir A. Edmonstone found them to be very different in form from any other cemeteries that he had seen, and represents in a plate the general aspect of this curious group of buildings.^g At distances of a few miles some other remains of ancient temples are found. This whole oâsis has always been, and still is, dependent on Egypt. It serves as a place of refreshment for the caravans, being on the route from Abyssinia and from Darfoor to Egypt. Its distance from Egypt is five days' journey, by the route from the Faïoom to the Great Oâsis, and about two days' journey west from the nearest part of the valley of the Nile. Mr. Belzoni found in the adjoining desert about thirty tumuli, some large enough to contain 100 corpses: he supposes them to contain the bodies of that part of the army of Cambyses which was sent to conquer the Ammonii in the deserts of Libya, and who were left to perish in the desert, in consequence of being betrayed by their guides. But that is a mere surmise. The question naturally arises, What set of people can we suppose to have so far interested themselves about these unfortunates as to give them interment, and collect stones over their graves? Edmonstone considers them as natural hillocks.

At the distance of 105 miles to the west of the great Oâsis, there is another which was never visited by any European before Sir A. Edmonstone in 1819, and is not even mentioned by any ancient or Arabian geographer excepting Olympiodorus. The chief town of that Oâsis is El-Cazar, beautifully situated on an eminence at the foot of a line of rocks rising abruptly behind it, and encircled by extensive gardens filled with a great variety of trees. It contains a strong sulphureous chalybeate spring, on which the inhabitants set a high value. There are some mummy pits in the caverns of the neighbouring rocks. A few miles from El-Cazar are the remains of a temple called Daer-Al-Hadjar, very much choked up with sand, like other Egyptian antiquities. But some chambers, covered with hieroglyphics, and blackened with the lamps of the ancient worshippers, are accessible, and their roof still entire. This oâsis contains in all twelve villages. The climate is extremely variable in winter. The rains are sometimes very abundant, though some seasons pass without any. Violent winds are frequent, and the khamseen in May and June is severely felt. The plague is unknown, but intermittent fevers are very common during

the intense heats of summer. The soil is a very red light earth, fertilized entirely by irrigation, and producing chiefly barley and rice. The inhabitants are Bedouins. They are much exposed to the incursions of the Barbary or Mogrebbin Arabs. From this to Tripoli is thirty days' journey of ten hours each. Lions and hyænas are not uncommon. At a village called Bellata, indigo is manufactured. The dry plant is put into an earthen jar with hot water, and stirred round and worked till the colour is pressed out. The liquor is then strained through the bark of a tree into another jar, where it is left for eight or nine days. The sediment is poured afterwards into a broad shallow hole in the sand, which absorbs the water, and leaves the indigo in solid cakes. It is one of the few manufactures which the pasha of Egypt has not monopolized. This western oâsis is connected with the great oâsis to the east by a low chain of mountains, with a tableland on the top, along which travellers proceed from the one to the other. The elevation of this table land makes it comparatively cold. In the course of this track are found the dilapidated remains of a very ancient temple, called Ennamoor. The inhabitants have some vague reports about other oâses to the west and to the north, which, however, are otherwise alike unknown to them and to geographers.

The Little Oâsis is on a road that is very little frequented; Ptolemy makes its latitude $28^{\circ} 45'$. Such is the position probably of its principal place. This oâsis produces the best dates known in Egypt. According to Browne, it is a kind of head quarters for the Mogrebbin, or western Arabs, who extend as far as Fezzan, and even to Tripoli. Towards the isthmus of Suez, there is an oâsis called Korayn by the inhabitants of the country. It contains eight or ten hamlets with their gardens, and about 4000 inhabitants. In the same direction is Salehyed, another oâsis shaded by a wood six miles^a long. It contains ten villages, and about 6000 inhabitants.

Egypt, which we have described in a physical and topographic point of view, has in modern times been considered as forming part of the Ottoman empire, and, like all the great divisions of that empire, has had a pasha at the head of the government. This situation did not confer much authority, but was very lucrative. It was an object of keen solicitation at Constantinople, and generally well paid for to the intriguing characters of the Seraglio. The pasha held his place only for a year or two. When he arrived in Egypt he received great honours. He presided over the divan at certain public ceremonies; yet was only the idle spectator of the acts of the Mameluke Beys, those military chiefs who held the efficient authority in their own hands, and even dismissed the pashas if they were not satisfied with their conduct. The Porte has repeatedly submitted to this indignity. The pasha had a feeble guard of ill equipped janissaries, and undisciplined Arnauts.

The lands of Egypt were possessed as fiefs of the Grand Signior, by the *multecyms*, a sort of nobility who in Turkey Proper are called *timariots*. Almost all the fiefs of Egypt were till lately in the hands of the Mameluke soldiery and their Beys. In its internal administration, Egypt was divided into twenty-four provinces, called *Kirrats*. The command of the provinces was every year

distributed among the Beys. They made their respective circuits to enforce the payment of taxes, keep the Arabs in subjection, and maintain the police. The Bey possessed of most influence generally resided at Cairo, with the title of Sheik-el-Beled, (Sheik of the country.)

The revenues were of two descriptions; those which belonged to the government, and those which belonged to the Mamelukes. The first comprehended the *miri*, or territorial tax, paid either in money or in produce; the customs; the duties on inland commerce; the rent of certain mines;^b and the kharadjeh, or capitation tax paid by foreigners. These revenues were charged with the expenses of government, and the surplus was required to be sent to Constantinople; but the different agents, from the receivers up to the Beys, managed so well, that the Grand Signior seldom touched any part of all these imposts. They even charged to his account expenses incurred by repairs of buildings and canals which never were executed.

The revenues of the Beys were composed not only of whatever they received from the villages assigned to them, but also of what they could extort in numberless ways. It is generally believed that the Mamelukes drew from Egypt in public and private revenues, about a million and a half sterling.^c While the French were in possession of the country, they varied from year to year according to the state of the war. General Reynier valued them at from twenty to twenty-five millions of francs, (from 833,333*l.* to 1,041,666*l.*)

The population of Egypt has often been rated at two millions and a half: but it has never been numbered, and we do not even know whether this estimate includes the Arabs who occupy so great a part of the country.

The power of the Mamelukes received from the French invasion a serious shock, from which it has not been able to recover. The Arnauts, or Albanian troops, who came to subjugate the country to the Turks, sought to seize it as a sovereignty for themselves. Egypt was distracted by numerous parties, and seemed to long for another European invasion. But a pasha of energetic character arrived, who stuck at no cruelty or perfidy in the execution of his policy, and, having brought the Mamelukes together into his palace under the pretext of an entertainment, put them to the sword. Those who had the good fortune to escape fled to Nubia, where they established themselves first at Ibrim, and attempted to make a stand. Driven from that place by the arms of the pasha, they retreated to Dongola to the number of 500, where they armed 4000 or 5000 negro slaves, and surrounded their city with a wall. At their head was Osman Bey Bardisi, who is said to have made a vow never to shave his head or his beard till he should enter Cairo in triumph. It appears, however, that in consequence of the farther extension of the warlike operations of the pasha Mahomet Ali, they have been forced to leave that station, have been reduced to an insignificant number by war and hardships, and that their slender remains had found their way to the kingdom of Darfoor, where their restless character was likely to procure their speedy annihilation.

These famous Mamelukes, the tyrants of Egypt, were, as is well known, military slaves purchased by the Fatimite Caliphs, to form their body guard. Notwithstanding the influence which the Turks exercised on the civil ad-

^a More than 2 Fr. leagues.

^b "Exploitations

^c "35 to 40 millions of francs."

ministration, the Mameluke body maintained its own military organization, and was always recruited in the same manner. Turkish merchants brought to Egypt slaves collected from different countries. Some were Germans and Russians; the greater part were from the Caucasian countries, from Georgia and Circassia, and were generally from fifteen to seventeen years old. The Mameluke chiefs always purchased some of them. These children were employed in personal attendance on their masters, who gave them an education entirely military. Each styled his master father, and was regarded as a part of his family.

When a master in reward of their services gave them their freedom, they left his house, taking with them some property: often he married them to one of his slaves. They were always ready to obey him, and followed him in war. The great badge of their liberty was permission to let the beard grow.

The spirit of the corps quite extinguished the sentiment of parental affection. The children of Mamelukes only succeeded to the personal effects of the father, never to his rank and power. A child reared by the women in the harem was an object of contempt. Perhaps that mode of thinking arose from an observation verified by long experience, that in Egypt foreign races degenerate like exotic plants in the second or third generation.

In general, the wives of the Mamelukes lived like those of the Osmanlis; for their husbands were equally jealous. But, as the children could never succeed to the situations or the titles of their fathers, they were less addicted to the delights of maternal fondness, and all those who could dispense with the privilege of becoming mothers took the requisite means without attaching to the act any notion of criminality.

The government is now more completely Turkish in its character than under the Mamelukes. The pasha in many of his acts disregards the Grand Signior, in this respect resembling most other Pashas placed in his commanding situation; but he does not declare himself independent. On the contrary, he lays his conquests at the feet of the Sultan's throne, as in the instance of his victory over the Wahabees, and the deliverance of Mecca, when he sent the captive chief of that formidable sect to Constantinople to give the supreme powers the pleasure of beheading him. For this he received the distinguishing title of Khan, which carries with it a perpetual immunity from the risk of judicial decapitation. His troops are chiefly Albanians, and Syrian cavalry, and, like other Turkish armies, occasionally prone to formidable mutinies, one of which lately occurred among the Albanians, while Mr. Belzoni was in the country,^a and was attended by a dreadful state of lawless disorder, more especially at Cairo and in its neighbourhood. It arose from an attempt on the part of the pasha to introduce European discipline and tactics, and it was only on abandoning that design that the soldiers were appeased, and the pasha's own security for power and life restored. The energy of that ruler, however, has created a greater degree of order in the country than had ever before existed in modern times. His police is vigilant, and Europeans can consequently travel here with safety, without being subjected to those dangers and indignities which

formerly rendered a journey through Egypt a scene of perilous adventure and perpetual suffering. This regularity is kept up by a system of summary justice in cases of murder, and other lawless acts. The pasha encourages the introduction of European improvements, wherever the prejudices and the established and immediate interests of the natives do not present an unsurmountable obstruction; but that is not always the case even in the most civilized states. He has introduced the fabrication of gunpowder, the refining of sugar, the making of fine indigo, and the silk manufacture, from which he derives great advantage. He is always inquiring after novelties in experimental philosophy, as well as the economical arts. He is very active, and constantly in motion. His leisure time is mostly spent at Soubra, a pleasure-house furnished with delightful gardens, three miles from Cairo, where one of the quondam Mamelukes who had been faithful to him, and recommended himself by his knowledge of agriculture and his general intelligence, occupies the situation of governor.

The Copts may be regarded as the rightful proprietors of Egypt. They bear the same relation to the Arabs that the Gauls did to the Franks under the first race of the French kings. But the victors and the vanquished have not been amalgamated into one national body. The Arabs in their fierce intolerance reduced the unhappy Greeks and Egyptians to a state of oppression. They thus forced them to live separate from themselves, forming a different nation, ruined, and almost annihilated. They did not, however, peremptorily insist on the alternative of conversion or extermination and exile, as the Romish Christians did with the Arabian Mussulmans in Spain; and the talent for writing and keeping accounts which the Copts possessed proved the means of earning a livelihood, and thus keeping up the existence of their race.^b The Arab, who knew no art but that of war, saw that he had an interest in preserving them. The present number of Copts is estimated at 30,000 families, or according to other data 200,000 souls. They are scattered partly over the Delta; but they live principally in Upper Egypt. In the Saïd they are sometimes almost the exclusive inhabitants of whole villages. They are the descendants of the ancient Egyptians, mingled with the Persians left by Cambyzes, and the Greeks left by Alexander and the Ptolemies.

According to the concurring testimonies of travellers, the Copts are distinguished by a darker complexion than the Arabs, flat foreheads, and hair partaking of the woolly character; the eyes narrow, and raised at the angles; high cheeks; short, though not flat noses; wide unmeaning mouths, far from the nose, and surrounded with rather thick lips; thin beards, want of grace in their shape, bandy legs ill adapted for agility, and long flat toes.^c

Eight or ten centuries ago the Copts spoke a peculiar language, which is still employed in their worship. It is a relict of the ancient Egyptian, mixed with many Arabic and Greek words. Though generally superseded by the Arabic in common conversation, it is still commonly used in the Coptic town of Nagadeh.^d Two dialects of this idiom, the Memphitic or Bahiritic and the Sahidic, are known to us by different religious books written in them: a third, the Bashmooric, has occasioned great discussions among

philologists, and they are not yet agreed about its nature and origin.^a The general character of the Coptic language consists in the shortness of its words, which are often monosyllables, in the simplicity of their grammatical modifications, and in the circumstance of expressing genders and even cases by prefixed syllables, and not by terminations.^b Compared with all other known languages, it has only been found to have some feeble indications of an ancient connection with the Hebrew and the Ethiopian. Without any foreign derivation, or known affinities, it seems to have an origin and formation of its own. The theocracy of ancient Egypt perhaps created a new and arbitrary language for the nation, which it was the object of that body to isolate from all its neighbours. The Coptic alphabet, though evidently modelled on the Greek, contains some characters belonging to the ancient alphabet or alphabets of Egypt.^c The Copts, at first attached to the ceremonial of the Great Eastern Greek Church, were drawn off by the sect of the Eutychians or Jacobites, whose creed confounds under one the two natures of Christ. Circumcision, though not viewed as a religious ceremony, is practised among them as contributing to cleanliness. The patriarch of Alexandria gives himself out as the successor of St. Mark the evangelist, whose body, or the head at least, the Venetians pretended to have removed. Acute, sober, avaricious, and grovelling, the Copts of the towns succeed in matters of business, and make themselves useful to the ignorant Mameluke and Turkish governments.

These characters furnish evidences of the identity of this nation with the ancient inhabitants of Egypt, who under the Ptolemies and the Cesars, necessarily mingled with the Greeks, the Syrians, and the Romans. Some have derived the term Copt from the name of the city Koptos in Upper Egypt; but that city seems never to have enjoyed any distinction, being only one of the nine residences of their bishops. Others have identified the term with a Greek word signifying circumcised.^d But it is not probable that the Copts themselves would adopt a nickname of that kind. The most probable opinion is, that it is identical with *Ægyptius*, which was also written *Ægyptios*,^e and in which the first syllable is an article. It is the same with the term *kypt*, *kibt*, or *kebt*, employed by the Copts as a designation for their country.^f Homer seems to have given the name of *Ægyptos* to the Nile;^g and, according to Herodotus, Thebes, the ancient capital, was called *Ægyptus*;^h which at least serves to prove that this term was equally indigenous with that of *Chymi* or *Chemi*, by which the Egyptians habitually designated their country.ⁱ

After the Copts come the Arabs, the most numerous of the inhabitants of modern Egypt; distinguished by a lively and expressive physiognomy, sunk, dark, and sparkling eyes, a general angularity of form, short pointed beards, thin lips habitually open and showing fine teeth, muscular arms, the whole body more remarkable for agility than

beauty, and more nervous than handsome. Such is the pastoral and more civilized Arab.^k The Bedouin, or independent Arab, has a wilder physiognomy. The Arab cultivators, including all who live in the country, such as the sheiks or heads of villages, the fellahs or peasants, the boufakirs or beggars, and the artisans, being more mixed and of different professions, present a character less distinctly marked.^l—The Turks have graver features and sleeker forms, thick eyelids allowing little expression to the eyes, large noses, handsome mouths, good lips, long bushy beards, lighter complexions, full necks, a grave and indolent habit of body; and in every thing an air of weight which they associate with the idea of nobleness. The Greeks, who must now be classed as foreigners, give us an idea of the regular features, the delicacy, and the versatility of their ancestors: they have the character of shrewdness and roguery in their transactions. The Jews, who have the same physiognomy as in Europe, but among whom some handsome individuals, particularly among the young, remind us of the head consecrated among painters as a representation of Jesus Christ, are, as every where else, devoted to the pursuits of commerce. Despised and incessantly buffeted about without being expelled, they compete with the Copts in the large towns of Egypt for situations in the customs, and the management of the business of the wealthy.

Nothing could be more curious than to see alongside of Arabs, who are a people rigidly attached to the distinctions of hereditary rank, a numerous class whose respect was all reserved for the purchased slave whose relations were unknown, and whose bravery, or other personal qualities, raised him to the first honours in the country. “I have heard,” says General Reynier, “both Turkish and Mameluke officers say of persons who occupied great posts, ‘He is a man of the best connections; he was purchased.’”^m On the contrary, the sheiks of villages, as soon as they are rich enough to have a household, and a certain number of horsemen, get a genealogy made out, which makes them to descend from some illustrious personage.

Besides the various alliances which subsist among tribes, the Arabs have leading parties, which may be considered as so many confederacies, and are headed by powerful sheiks. Some of these are found even in the heart of the Delta. “The inhabitants of the villages,” says M. Girard,ⁿ “form two hostile parties, who do every thing in their power to injure each other. They are distinguished by the appellations of the Saad and the Hharam. In the civil wars which desolated Arabia in the 65th year of the hejira, under the caliph Yezyd-ebn-Ma’ouyeh, the two armies used these words as their respective watchwords during the night. They were the family names of their respective chiefs. The combatants and their posterity adopted them ever after, and under them perpetuated their discords. The Arabs, who have at different times come to settle in Egypt, brought along with one or other of these names a blind hatred towards the opposite faction.

Some particular traits distinguish the Egyptians from the other Orientals. A country frequently laid under water makes the art of swimming a valuable acquisition. The children learn it at play, even the girls become fond of it, and are seen swimming in flocks from village to village with all the dexterity of the fabled nymphs.^a At the festival of the opening of the canals, several professional swimmers publicly exhibit their skill in presence of the pasha. Their evolutions are executed with surprising vigour. They sometimes float down the river on their backs with a cup of coffee in one hand, and a pipe in the other, while their feet are tied together with an iron chain.^b The Egyptians are well acquainted with the art of training animals. Saddled goats are seen carrying monkeys on their backs, and asses as well trained and as docile as English horses. Carrying pigeons were more common here than in any other part of the east. In the 17th century the governor of Damietta corresponded with the pasha of Cairo by means of these winged messengers.^c Mallet mentions this as a practice which had fallen into disuse.^d The most astonishing phenomenon of this description is the power which certain persons have of handling and governing the most venomous serpents. The modern *Psylli* are not inferior to the ancient. They suffer vipers to twine round their bodies; they keep them in the folds of their shirts; they make them go into bottles, and come out again: sometimes they tear them with their teeth, and eat their flesh.^e The secrets on which these practices depend are unknown: they are founded on address and observation, though the Orientals ascribe them to magic.^f

In order to complete our picture of modern Egypt, we shall give a brief view of its trade and manufactures.

It is chiefly at Balass in Upper Egypt that the earthen jars, hence called balasses, are manufactured. These manufactures supply not only the whole of Egypt, but Syria and the islands of the Grecian Archipelago. They have the property of allowing the water to transude gradually, and thus keep up a refreshing coolness by its evaporation. The manufacture not being expensive, they are sold so very cheap that the poorest person can command as many as he wants, and they often enter among the materials for building the walls of houses; nature furnishes the raw clay in a state ready for use, in the adjoining desert. It consists of a fat, fine, saponaceous and compact marl, which only requires moistening and working up to become pliable and tenacious, and the vessels which are turned from it, after being dried and half baked in the sun, are in a few hours completed by the heat of a slight straw fire. They form rafts of them, which are described by all the travellers in Egypt. Such is the stability of the habits, customs, and arts in this singular country, that M. Denon observed jars of the same sort, of the same shape, employed for the same purposes, and set on the same tripods, in hieroglyphic paintings, and in representations contained in manuscripts.

In Sioot and the neighbourhood, a considerable quantity of linen is manufactured; at Djirdjeh, Farshyoot, and Kenneh, cotton stuffs and shawls of a much closer fabric. The cotton manufactured in these three places is brought from Syria and the Delta, that which is produced in the

country being only employed at Esneh, where the hand-somest cotton cloths of Upper Egypt are made. From this part of the country there is a considerable exportation of grain, linen, and cotton stuffs, and different sorts of oil. It receives in exchange rice and salt from the Delta, soap, silks, and cotton stuffs from Syria, and different European articles, such as iron, lead, copper, woollen cloths, and tar.

It is only in Faïoom that rose water is made. When the roses are plenty, thirty sets of apparatus are employed at Medineh for distilling them. The apparatus is very simple. The same place also contains manufactures of woollen, cotton, and linen stuffs, and shawls. Sometimes 8000 shawls are exported from this place in a month.

The caravans from Abyssinia travel northward through the desert, on the east of the Nile, as far as Esneh. They bring ivory and ostrich feathers; but their principal trade consists in gum and young slaves of both sexes. Cairo is their ultimate destination, and the place where their sales are completed. They carry home Venetian glass manufactures, woollen robes, cotton and linen stuffs, blue shawls, and some other stuffs which they purchase at Sioot and at Kenneh.

The Ababdeh and Bisharieh tribes also come to Esneh for metals, utensils, and such grain as they require. They sell slaves, camels, acacia gum which they gather in their deserts, and the charcoal which they make from the acacia trees; but the most valuable commodity which they bring is senna, which they gather in the mountains between the Nile and the Red Sea, in the latitude of Syene, and farther south, where it grows without culture. The inhabitants of Goobanieh, a village four hours' journey below Syene, on the left bank of the Nile, form, every year, in company with the Ababdehs, a caravan, which goes into the interior of the deserts which lie south-west from the first cataract, to collect alum, which was formerly a considerable part of the exports of Egypt.

The trade to Cosseir, on the shore of the Red Sea, is only a feeble remnant of that by which Egypt was once enriched. The exports are wheat, flour, barley, beans, lentils, sugar, carthamus flowers, oil of lettuce, and butter. The importations are coffee, cotton cloth, Indian muslins, English silks, spices, incense, gums, and Cashmere shawls. This trade is conducted by persons going on their pilgrimage to Mecca.

Two caravans arrive every year from Darfoor, each composed of 4000 or 5000 camels, led by 200 or 300 persons, who bring to Sioot and to Cairo elephants' teeth, rhinoceros' horns, ostrich feathers, gum-arabic, tamarinds, natron, and slaves, the number of which averages 5000 or 6000 annually, chiefly young girls or women. One author says that the number of slaves sometimes amounts to 12,000, and that of the camels to 15,000.

Egypt also receives caravans from Syria, from Barbary, and from Sennaar. Those from Syria bring cottons, tobacco, silk and woollen stuffs, wax, honey, dried raisins, and other objects of consumption. The caravans from Sennaar are smaller than those from Darfoor, and bring nearly the same articles, together with civets, and the teeth and skins of the hippopotamus.^g

We shall not undertake to give a comparative tabular view of the ancient and modern divisions of Egypt. For such a task we have not sufficient data. The reader who wishes for such information as history affords on this subject, may consult a work by the learned M. Champollion, entitled, "l'Égypte sous les Pharaons."

BOOK LXIII.

NUBIA, ABYSSINIA, AND THE COASTS OF BEJA AND HABESH.

WE have described the region of the lower Nile, with a minuteness corresponding to its great celebrity. Our survey of the countries situated on the higher parts of the course of this river will be somewhat more rapid. In the present state of our knowledge, it is proper to exclude from this division the countries yet unknown which are watered by the Bahr-el-Abiad, before it joins the Nile of Abyssinia. The region now to be described, being thus restricted, will correspond to the *Æthiopia supra Ægyptum* of the ancients, a country concerning which ancient history furnishes us with some scattered lights, such as the accounts contained in the history of Herodotus, the researches of Strabo, the travels of Artemidorus and Agatharchides, to which are to be added the inscriptions of Adulis, which are monuments of the expeditions of one of the Ptolemies, or of an Abyssinian king,^a and the information given by Pliny the naturalist, as stated in our History of Geography.

The first country which is entered by a person ascending the Nile, above the first cataract, is NUBIA, a most extensive region, the boundaries of which are vague and uncertain. Bakooi makes it thirty days' journey in length, along the east bank of the Nile.^b Edrisi, who most probably includes Sennaar under the same name, says that two months are required for crossing Nubia,^c an account which in that case coincides with the journals of Poncet and Bruce.

While authors differ widely in several other particulars relative to Nubia, they all agree respecting the physical character of the country. From January to April it is scorched up with insupportable heats. The rainy season lasts from June to September, but with frequent irregularities. The thermometer sometimes reaches 119 degrees of Fahrenheit, and the burning sands render travelling impracticable except by night.^d The high lands consist entirely of frightful deserts. That which is called the Desert of Nubia extends on the east of the Nile from Syene to Gooz. The traveller constantly journeys either over deep sand or sharp stones. In several places the ground is covered with a stratum of rock-salt, or strowed with masses of granite, jasper, or marble. Now and then we find a grove of stunted acacias, or tufts of colocynth and of senna. The traveller often finds no water to allay

his thirst, except what is brackish and putrid, for the murderous Arab, the sanguinary Bishareen, the fanatical Jahalee, the Takakee, and the Shaigee, lie in ambush near the few springs which the country contains.^e The western desert, less arid and less extensive, is known by the name of Bahiooda. Between these two solitudes, condemned by nature to an unvarying and utter sterility, lies the narrow vale of the Nile, which, though deprived of the advantages of regular inundations in consequence of the height of the surface above the river, has some districts, and more particularly some islands, in which a high degree of fertility rewards the industry of those who raise by artificial means^f the waters of the river.^g The southern parts of Nubia, watered by the Tacazzé, the Bahr-el-Azrek, and the Bahr-el-Abiad, present a very different appearance. Under the shade of close forests, or on the verdant surface of vast meadows, are seen sometimes the heavy buffalo, sometimes the fleet gazelle. Frequently, however, the extreme heat, the rains, and the formidable swarms of the tsaltsalya fly, spread desolation over those countries, which belong to the kingdom of Sennaar. The dourra and the bammia, (the last of which is described by Prosper Alpinus,) are the principal sorts of grain, though wheat and millet are also cultivated. Two sorts of senna are exported; but the sugar cane, which abounds along the course of the Nile, is not turned to any account. The ebony tree predominates in the forests,^h which also contain many species of palms.

The *Acacia vera*, (*Mimosa nilotica*,) from which the gum is obtained, extends from Egypt to Darfoor. Pliny seems to reckon the large wild cotton tree among the trees of Nubia.ⁱ About the ancient Meroë apple trees, according to Strabo, ceased to prosper, and the sheep were covered with hair instead of wool.^k Elephants, rhinoceroses, gazelles, ostriches, and all the African animals, perhaps even the giraffe,^l are to be seen in Nubia. The gold of Sennaar is sometimes mentioned; but, though Ibn-al-Ooardy says that there are mines of this metal in Nubia, it is impossible to determine their situation. The famous mountain of emeralds, which was said to be in Nubia, belongs to its northern part, or rather to the south of Egypt. It is called Zubarah, and is not far from the Red Sea. Of these mines, in their present state, we have already given an account. Strabo and Diodorus tell us that the ancient *Meroë*, which

corresponds with Southern Nubia, contained mines of gold, of copper, and of iron.^a

It would be vain to attempt to give any precise account of the political subdivisions of a country so little known, and involved in so wild a state of anarchy. We shall merely give a few rapid sketches on the subject. Turkish Nubia extends from Assooan, or *Syene*, to the fort of Ibrim, (or Ibrahim,) which Father Sicard dignifies with the title of its capital.^b The power of the beys or pashas of Egypt over this remote district, has always been uncertain and temporary. At present the energetic and enterprising pasha Mahomed Ali has extended his arms to a great distance up the Nile, having subdued the whole of Nubia Proper, and even taken Sennaar.

Egyptian Nubia contains, along the banks of the Nile, numerous monuments of ancient art, as temples, obelisks, and statues. Some of these monuments are Egyptian, others Grecian.

At Taffa, the granite rocks rise prurupt on each side of the Nile, the chain crossing it at this place, and appearing as if a passage had been cut through it for the river. At Katabishé there are ruins of some Sarazenic houses, and an elegant Egyptian temple, thought to have been built in the time of the Ptolemies; in that neighbourhood the ruins of a small Grecian temple are observed, which has been overturned by violence. Lately a golden Grecian lamp was found buried under the ruins.

Deir, the capital of lower Nubia, consists of several groups of houses, built of earth intermixed with stones.

Ibrim is built on a rock at the river's edge, but the houses have been deserted ever since the Mamelukes left the place on their retreat to Dongola.

Mr. Belzoni is the first recent traveller who has ascended the river beyond Ibrim. He found the remains of a well-constructed tower on the island of Hogos. The people here are exceedingly poor and dirty, sometimes eating the raw entrails of animals, after dipping them once slightly in water. At Ebsambool are some temples and colossal statues. Some of the latter cut out of the solid rock, are thirty feet high. The inhabitants of the place and neighbourhood lead the most abject lives that can be imagined. The Cachef and his servants make the freest use of the property of the people, taking without ceremony whatever they want. If refused they use force, and if resisted they murder the opponent. In this manner all the time of the rulers is spent; and in this manner they live. Their purchases and sales are entirely conducted by barter, and Mr. Belzoni found it almost impossible to convince them that money could procure dourra or other articles from Syene and other distant places.

At Ooadi-Halfa, above Ebsambool, is the second cataract. The rock forming it is black, probably basaltic. It seems not to be navigable at any season.

The high lands of northern Nubia are inhabited by two almost independent nomade tribes. One of them lives on the west side of the Nile, and is called the Barabras. They are a very lean race of men, apparently destitute both of fat and of flesh, and made up of nerves and tendons, with a few muscular fibres, more elastic than strong. Their

shining skin is of a transparent black and brown.^c They have no resemblance to the negroes of the west of Africa. Their hollow eyes sparkle under an uncommonly projecting eye-brow,^d their nostrils are large, the nose sharp, the mouth wide, yet the lips thin; the hair of the head and beard is thin and in small tufts. Wrinkled at an early age, but always lively, always nimble, they only betray their age by the whiteness of their beards. Their physiognomy is cheerful, and their dispositions lively and good-humoured. In Egypt they are generally employed to watch the magazines and wood-yards. They dress in a piece of white or blue woollen cloth, earn very little, subsist on next to nothing, and are always attached and faithful to their masters.^e

The deserts situated to the east of the Nile, from the valley of Cosseir till we proceed far south in Nubia, are occupied by the Ababdeh. They are enemies to all the tribes which live eastward of the Nile, between the valley of Cosseir and the isthmus of Suez. The Ababdeh differ entirely in their customs, language, and dress, from the Arabs found in Egypt. They are black, but have the same form of head as the Europeans.^f Their heads are uncovered, but their hair is worn long. Their clothing consists of a piece of cloth fastened above the haunches. They anoint their bodies, and particularly their heads, with mutton suet. They have no fire-arms, and few horses. They rear a sort of camel which they call *aguine*, which is smaller, slenderer, and more active than the common kind. Their warlike amusements are animated by a music less pensive and monotonous than that of the Egyptians. The same individual is both poet and musician, and he accompanies his song with a sort of mandoline. They are Mahometans, but not rigid. They bury their dead by covering the bodies with stones.

The middle part of Nubia contains a state or kingdom concerning which we have little recent information. It goes under the name of Dongola, which is also the name of the capital,—a city rich and commercial, and containing 10,000 families, according to the Arabian authors of the middle age.^g Poncet found the city ill-built, the cabins formed of clay,^h and the intervening spaces encumbered with sand-hills.ⁱ The castle which stands in the centre of the city is spacious but poorly fortified, though sufficient to keep the Arabs in check. The fields, watered by the Nile, exhibit in the month of September an agreeable verdure. The people conjoin great ferocity with great cunning. The palace, like those of all the kings of Africa, is a vast cottage. According to Thevenot, the king of Dongola paid a tribute in cloth to the king of Sennaar. The inhabitants export slaves, gold dust, and ostrich feathers, and, according to Leo, musk and sandal wood. They are Barabras, or, as Thevenot calls them, Barberins. Persons of rank here go bareheaded, their hair being disposed in tresses, and their whole clothing consists in a rude vest without sleeves. They are very skilful riders, and have beautiful horses. They profess the religion of Mahomet, and continually repeat its brief and comprehensive creed, but know nothing farther. Their lives are extremely dissolute. The Mamelukes, when they

fled from Egypt, lately took possession of Dongola, but subsequently Mahomed Ali, Pasha of Egypt, carried his victorious arms to this part of Nubia, and added it to his dominions.

Ascending to the confluence of the great Nile with the Nile of Abyssinia, we enter the territories of the kingdom of Sennaar, which occupy the space assigned by the ancients to the famous empire of *Meroë*, the origin of which is lost amidst the darkness of antiquity. Many writers, both ancient and modern, have considered it as the cradle of all the religious and political institutions of Egypt,^a and it must at least be admitted to have been a very civilized and a very powerful state. Bruce thought that he saw the ruins of its capital below the village of Shandy, opposite to the isle of Kurgos. The distances given by Herodotus and Eratosthenes coincide very well with that position; and the island which, according to Pliny, formed the port of Meroë, is found to correspond with equal probability.

The *Nubæ* of Ptolemy lived more to the west. They probably settled in the countries adjoining the Nile, after the fall of Meroë. These people are a gentle sort of Negroes, with small features, woolly hair, flat noses, speaking a soft sonorous language totally distinct from that of their neighbours. They are idolaters, or rather, according to Bruce, they appear to have preserved some traces of the ancient religion of the Sabæans. They worship the moon, and always do homage to that luminary while she shines during the night. At new moon they issue from their dark huts and pronounce some forms of religious words. They seemed to Bruce to show less respect to the sun. The *Nubæ* resemble the Mahometans in being circumcised, but they keep herds of swine, and eat pork freely. They probably were once subdued by the Arabs; for, according to Bakooi,^b the Nubians had a king of the ancient family of the Homerites. It is possible, however, as this same author affirms, that they may have been Christians. The Christian religion was lost for want of priests, which they could no longer procure from Egypt, and with which the Abyssinians refused to supply them.^c

In 1504, a negro nation, till then unknown, leaving the west bank of the White River, or Bahr-el-Abiad, embarked on this river, and came down to invade the lands of the Nubian Arabs. The event of a very bloody battle proved favourable to their cause. These negroes called themselves Shillooks. They demanded that the Arabs should give them every year one half of their flocks. On this condition, they allowed the Arabs to retain their own chief, under the title of *wed-agid*, and lieutenant of their *malek*. On the Blue River, or Abyssinian Nile, the Shillooks founded the city of Sennaar, which, according to Poncet, contained 100,000 inhabitants.^d It is a commercial place, and sends caravans to Egypt, to Nigritia, and to the port of Jidda in Arabia. The brick walls of the *malek's* palace, and some Persian tapestry displayed in the interior, announce the magnificence of a great sovereign for this country. The town is nearly on the same level with the river, being only as high above it as to prevent the danger of being flooded. The soil of the adjoining district, for a breadth of

two miles on each side of the river, is uncommonly rich and fertile, and produces great abundance of food. But the country is unhealthy to men, and no domestic animals can live in it. The latter are reared on the neighbouring sands. The king of Sennaar cannot maintain a single horse, while the sheik of the desert has a regular establishment of cavalry.

To the north of Sennaar we find Gherri, the ancient capital of the Nubians; Halfaya, which is built of hewn stone; Harbagi, in a wooded country, where the yellow and blue flowers of a very thorny acacia exhale their perfumes, and where the scene is animated with paroquets, and a thousand other birds. To the south we find Gisine, in the midst of a forest of *doomy* palms, the leaves of which are used for making sails and cordage, while their fruit contains a juice very pleasant to drink;^e then Deleb; and, after crossing a forest of tamarind trees, we find Serke, a town of 700 houses on the frontier of Abyssinia.

The Shillooks were originally idolaters, but their intercourse with the Egyptians brought them over to Mahometanism. Their government is despotic, yet mild. They attach to the title of slave the same honour which in Europe is connected with that of a nobleman. The kingdom is hereditary, descending to the eldest son, and all the other sons are put to death. A council of the *grandees* of the state has the power of deposing the sovereign, or condemning him to death. During his reign, one of his relations whose office it is to put him to death in case of his condemnation, has the title of the royal executioner. It is a place of great distinction; and the individual who holds it lives on terms of sufficient cordiality with the prince to whom he stands in so singular a relation. Some of them have had repeated occasion to exercise their function. The army consists of 1800 Shillook cavalry, and 12,000 Nubians armed with lances. The name of Fungi, by which the Shillooks are called, is, according to Bruns, only an honourable title of Arabic derivation,^f signifying victors. But it is worthy of remark, that the Portuguese give the name of Funchens to a nation in the neighbourhood of Congo. Sennaar, however, is included among the recent conquests of the Pasha of Egypt; and if the former government, with its laws and arrangements, is permitted to remain, it is only as the vassal of that Turkish power.^g

According to some geographers, we must also comprehend in Nubia three provinces situated to the south of Sennaar. The first is El-Aice, situated on both sides of a great river, a country peopled by fishermen, who in their small barks boldly pass the cataracts.

Kordofan extends along the Bahr-el-Abiad.^h There a trade is carried on in slaves, brought from Dyre and from Tegla, unknown countries of the interior.

Lastly, the country of Fazuelo is bounded on the east by the Bahr-el-Azrek, or the Nile of Abyssinia. The public revenues here are paid in gold or in slaves. These three countries, however, seem to undergo a frequent change of masters, and, according to Browne, Kordofan was about twenty years agoⁱ subject to the sultan at Darfoor.

We might have now given a sketch of the coast of Nubia on the Arabian Gulf, but several reasons, both geogra-

phical and historical, have determined us to connect that territory in the same description with the coast of Abyssinia, which will be found in a subsequent part of the present Book.

To the south of Nubia are situated the extensive provinces which belong, or have belonged, to the kingdom of Ethiopia, more generally known by the name of ABYSSINIA. We have not much certain and authentic information respecting this country. The accounts given by the Arabian geographers, Bakooi, Edrisi, and more particularly by Macrizi,^a show us that the Mahometans had little connection with this Christian empire. The modern geography of the country is almost entirely derived from the travels of the Portuguese, Alvarez, Bermudez, Payz, Almeida, and Lobo, whose accounts have been carefully collected and abridged by their countrymen Tellez, and learnedly commented on by the German Ludolf, the Strabo of these countries. To this we must add a few notices furnished by Thevenot and Poncet. An important narrative by Petit-la-Croix, dated in 1700, partly drawn up from information furnished by Abyssinians whom the author had known in Egypt, exists in manuscript in the library at Leyden.^b At last in the eighteenth century appeared the famous work of Mr. Bruce, the best known, though not the purest of all our sources of information. It has since received confirmation in some points, and correction in others, from Mr. Salt.

It is with these insufficient materials that geography has to make out a description of Abyssinia. This description must therefore be vague and incomplete. Our account of the situation and extent of the country does not admit of rigorous precision; for the limits which separate the Abyssinians from Nubia on the north, from the Gallas on the south-west and south, and from the kingdom of Adel on the south-east, constantly depend on the uncertain issue of frequent appeals to arms. If we include in it the coasts of the Red Sea, and the provinces occupied by the Gallas, we may give Abyssinia a length of 560 miles from the 15th to the 7th parallel of north latitude, and a breadth of 640 miles^c from the 32d to the 42d degree of east longitude.^d Taken in this geographical and historical acceptation, Abyssinia would have an extent of 322,000 square miles.^e This country corresponds to the most southern part of the *Æthiopia supra Ægyptum* of the ancients, and, although we are certain that the denomination of Ethiopians is of Greek origin, and has been employed to signify every people of a deep complexion, the Abyssinians still call themselves *Iiopiawan*, and their country *Iiopia*. But they prefer the name of Agazian for the people, and that of Agazi, or Ghez, for the kingdom. The name of Habesh, given to them by the Mahometans, and from which the Europeans have coined such names as *Abassi* and *Abyssini*, is an Arabic term, signifying "a mixed people," and the Abyssinians scornfully disclaim it.^f

Considered as a whole, Abyssinia forms a table land gently inclined to the north-west, and having two great declivities on the east and on the south; the first towards

the Arabian Gulf, and the second towards the interior of Africa. Do these two declivities consist of regular chains? or are they only crowned with isolated mountains, like Lamalmon and Amba-Gideon? These are questions which we are not yet prepared to answer. Travellers only speak in a general way of the extraordinary configuration of these mountains. They are almost every where perpendicular, and are ascended by means of ropes and ladders. The rocks resemble the ramparts and towers of ruined towns. Father Tellez pretends that these mountains are higher than the Alps,^g but we find them nowhere capped with snow, except perhaps, the Samen mountains in the province of Tigre, and that of Namera in Gojam.^h

The number of rivers which take their rise in this country is one evidence of its great elevation. Beginning in the west, the Maleg, the Bahr-el-Azrek, or Abyssinian Nile, (the *Astapus* of the ancients,) the Rahad, which receives the Dender, and the Tacazzé, which receives the Mareb, all contribute to form or to augment the great Nile, while the Hanazo and the Hawash disappear under the sand before reaching the Arabian Gulf. The Zeebe flows perhaps to the coast of Zanguebar. According to Petit-la-Croix, it is lost in the sands of the southern plateau.ⁱ We must also take notice of the great lake Dembea, which, like all those of the torrid zone, changes its size with the revolutions of the seasons.

In general, the rivers, the rains, and the elevation of the surface, render the temperature much cooler than that of Egypt and of Nubia. The heat of the atmosphere, judging by the feelings of the human body, is much less than that indicated by the thermometer.^k Some of the provinces are even more temperate than Portugal or Spain; but in the low valleys, the effects of a suffocating heat are combined with those of the exhalations of stagnant water, to give origin to elephantiasis, ophthalmia, and many other diseases.^l

The winter in Abyssinia, in so far as weather is concerned, begins in June, and continues till the beginning of September. The rain, often attended with thunder and dreadful hurricanes, obliges the inhabitants to intermit all their labours, and puts a stop to all military operations.^m The other months of the year are not entirely exempt from inclement weather. The finest are those of December and January. This is the general character of the climate, particularly in the interior of the country. But the mountainous surface of Abyssinia gives rise to many variations. In the east, on the borders of the Red Sea, between the shore and the mountains, the rainy season begins when it is over in the interior. This singularity greatly surprised Alvarez, a Portuguese, who at Dobba, found himself transported at once from winter to summer.ⁿ

Abyssinia, being full of mountains, cannot be destitute of minerals. According to the manuscript of Petit-la-Croix, it contains many mines of iron, copper, lead, and sulphur,^o but no mention is made of them by travellers. The washing operations at Damot, and the shallow mines of Enarea, produce a gold of extreme fineness.^p Bruce

informs us that the finest gold is found in the western provinces, at the feet of the mountains of Dyre and Tegla. The great plains, covered with rock-salt, at the foot of the eastern mountains, have excited the admiration of travellers. The salt there forms crystals of uncommon length.^a

In a mountainous humid country, warmed by a vertical sun, the vegetable kingdom naturally displays a magnificence which botanists are sorry they have not an opportunity of surveying. On this, as on many other points, Mr. Bruce has deceived our hopes. He gives little information that is really new. The *cusso* tree, for example, which he has named *Banksia Abyssinica*, had been previously described by Godigny.^b Messrs. Blumenbach and Gmelin had been long acquainted with the *girgir*, a gramineous plant, which the English traveller considered as a discovery of his own. The trees of Abyssinia hitherto described, though probably not the principal ones of the country, are the sycamore-fig, the *Erythrina corallodendron*, the tamarind, the date, the coffee tree, a large tree used for building boats which Bruce calls the *rak*, and two species of gum-bearing *mimosas*. The arborescent *Euphorbia*^c is found on some of the arid mountains. A shrub called in the language of the country *wooginoos*, the *Brucea antidysenterica* of Bruce and Gmelin, is justly praised by the English traveller for its medicinal powers.

The chief alimentary plants are millet, barley, wheat, maize, and teff, besides which there are many others. All travellers concur in praising the fine wheaten bread of Abyssinia; but it is only eaten by people of rank.

The *teff* or *tafo* is a grain smaller than mustard seed, well tasted, and not liable to the depredations of worms.^d Blumenbach thinks that it is the same with the *Poa Abyssinica*. The gardens of Abyssinia contain many species of fruit trees, and of leguminous and oily plants which are unknown to us.^e

There are generally two harvests, one during the rainy season, in the months of July, August, and September; the other in spring. At Adowa and in the neighbourhood, there are three crops. Here, as in Egypt, the grain is trodden out by the feet of cattle. Some vines are cultivated, and wine is made, though in very small quantity; for this liquor is not much relished by the inhabitants, who prefer a sort of hydromel mixed with opium. The natives cultivate great quantities of a herbaceous alimentary plant resembling the banana, which serves them for bread, and which Lobo calls *ensete*.^f The *Cyperus papyrus* is found in the marshes of Abyssinia as well as in Egypt. Mr. Bruce asserts, that the tree which produces the balm of Judea, and myrrh, is indigenous in Abyssinia, or more properly speaking, on the coast of Adel, from the Straits of Bab-el-mandeb to Cape Guardafui. He expresses his apprehensions that the odoriferous forests of that country, which were known even to Herodotus,^g were cut down so fast that they were in danger of soon disappearing. The whole of Abyssinia

is scented with the perfumes exhaled from the roses, jesamines, lilies, and pinks, with which the fields are covered.

The animal kingdom displays equal variety and abundance. The cattle are numerous and of large size, with horns of enormous length. There are wild buffaloes, which sometimes attack travellers. The ass and the mule supply in this country the place of the camel. The horses, which are small but extremely lively, as in all mountainous countries, are only used for the purposes of war. The two-horned rhinoceros is seen wandering in numerous flocks. This animal differs essentially from the one-horned rhinoceros of Asia. Lobo and Bruce both think, in opposition to the general opinion of naturalists, that the one-horned rhinoceros is also found in Abyssinia. But Lobo says that he has found, in the accounts given by some of his own countrymen, another animal quite different from the rhinoceros. This, he supposes to be the famous unicorn, which resembles the horse, and is furnished with a mane.^h Very probably these Portuguese had seen the same animal which has lately been seen, and authentically described, by Mr. Campbell, in exploring the south of Africa, and of which we shall give an account in a subsequent Book.

It is unnecessary to name the lions, panthers, and various other animals of the cat kind, of which Africa is the native country. The giraffe extends to Abyssinia. Marco Polo and Bakooi, an Arabian author, long ago spoke of it in such a way as to leave no doubt of its existence. Browne says that it is found in Darfoor.ⁱ So numerous, so ferocious, and so bold are the hyænas in Abyssinia, that they sometimes prowl in the streets of the towns during the night. There are also wild boars, gazelles or antelopes, and monkeys: among the last is a small green kind which commits serious ravages among the corn. Lobo and Petit-la-Croix^k describe the zebra so minutely as to show that this animal is found in Abyssinia. The *Ashkoko*, described by Mr. Bruce, is the *Cavia capensis*,^l according to Blumenbach, and the booted lynx, according to Gmelin.^m There is also a great number of serpents of remarkable species, and enormous in size. The lakes and rivers swarm with hippopotami and crocodiles. The species of birds are no less numerous. One of these is the great golden eagle. Alvarez and Lobo mention many singular birds resembling the birds of paradise, the ostrich, and other species peculiar to the torrid zone; but aquatic birds are rare.

Travellers speak of many species of wild bees, which build their combs under ground, and produce excellent honey.ⁿ The most remarkable insect is a fly, the sting of which is dreaded even by the lion, and which forces whole tribes to change their residence, a circumstance which Agatharchides had anticipated Bruce in remarking.^o The locusts are still more destructive. Their numberless swarms devastate whole provinces, and involve the inhabitants in the miseries of famine.^p

This general description of so extensive a country, must

be subject to many local gradations and modifications, depending on the different positions of its component parts. But our topographical information respecting Abyssinia is so limited and obscure, that we cannot even give a complete enumeration of the provinces. Ludolf speaks of nine kingdoms and five provinces. Thevenot, from the information of an Ethiopian ambassador, says there are seven kingdoms and twenty-four provinces. Bruce mentions nineteen provinces, and, lastly, Petit-la-Croix enumerates thirty-five kingdoms and ten provinces, which have belonged to the Abyssinian monarch, of which he retains only six kingdoms and a half, with the ten provinces.^a

Reserving the maritime parts of Abyssinia for another place, we must begin our tour with the kingdom of Tigré, which forms the north-eastern extremity of Abyssinia. This large and very populous province contains the city of Axum, which is 120 miles^b from the Red Sea.^c It is the ancient residence of the Abyssinian monarchs, who still go thither for the ceremony of coronation. The learned are not agreed respecting the antiquity of this city, which was not known to Herodotus or Strabo. The first author who mentions it is Arrian, in his *Periplus of the Erythrean Sea*. In the second century, when he wrote, it was a place of great trade in ivory.^d Its flourishing condition in the fourth, fifth, and sixth centuries, is attested by the descriptions left us by Procopius, Stephanus Byzantinus, Cosmas, and Nonnosus.^e The Portuguese travellers found in it magnificent ruins, the remains of temples and palaces, obelisks without hieroglyphics, one of which was sixty-four feet in height, consisting of a single block of granite, terminated by a crescent; also mutilated figures of lions, bears, and dogs, and inscriptions in Greek and Latin characters.^f According to Mr. Salt, the obelisk, which is still standing, is eighty feet high. There were fifty-four others which had been thrown down by the misguided zeal of a Christian princess. The seat on which the kings used to sit when the crown was put on their head, in front of the great church, has an Ethiopic inscription. Another Greek inscription, on a monument, the original purpose of which is unknown, attests the victories of King Aezanes. The existence of that inscription establishes the authenticity of the one seen by Cosmas at Adulis. But the one which Bruce pretended to have discovered at Axum appears to have been a mere fabrication.^g The modern town of Axum reckons 600 houses, but no remarkable buildings. It contains manufactories of good parchment, and of coarse cotton stuffs. This last branch of industry is also carried on to a great extent at Adowa, a town of 300 houses, which has, since 1769, become the capital of the province. The neighbourhood of Adowa, though containing steep mountains, yields three crops in the year.—In the northern part of this province, on the road from Masuah to Axum, is Dixan, a considerable town, with flat-roofed houses, on the tops of which two earthen pots are stuck up instead of chimneys. The inhabitants are said to be idle and dirty. The women perform the drudgeries of agriculture, to which they go out carrying their children on their backs. The people are very ignorant, and the few who can read

are considered as fully qualified for the priesthood. It is an emporium for the sale of white cloths, tobacco, pepper, looking-glasses, and spirits. Many children are also sold and sent to the Arabians of Mecca.—At Abuhassubba, between Dixan and Axum, there is a large church cut entirely out of the solid rock. One of its rooms is fifty feet by thirty: another has a dome forty feet high. The walls are carved, adorned with crosses, Ethiopic inscriptions, and paintings, representing Christ, the apostles, and St. George. On the eastern frontier of Tigré is the town of Antale, which, during the visit of Mr. Salt, was the seat of government, being the residence of the viceroy, Ras Wellata Sella. It consists of about 1000 hovels of mud and straw, together with the palace. In this province is the monastery of Fremona, which has always been the chief establishment of the Jesuits. It is about a mile in circumference, surrounded by walls, flanked with towers, and pierced for musketry. It appeared to Mr. Bruce to have more the air of a castle than of a convent, and to be the most defensible place that he saw in Abyssinia. The province of Tigré in general is extremely fertile, but the inhabitants are a ferocious, blood-thirsty, corrupt, and perfidious race.^h

The provinces adjoining Tigré on the west are called Wogara, Sireh, and Samen. Wogara is one of the granaries of Abyssinia. The humid plains of Sireh produce numerous palms, and a variety of fruit trees. The banks of the Tacazzé, on its borders, are very beautiful, from the number of fine trees with which they are decorated. In Samen we find several mountain chains, the most celebrated of which are Lamalmon and Amba-Gideon. The last is properly a table-land, which has so steep a descent all round as to be rendered almost inaccessible, but sufficient, both in size and fertility, to support a whole army. It was the fortress of the Falasja or Abyssinian Jews, who were formerly masters of the province of Samen.

To the south-west of Tigré, in the fertile plains surrounding lake Tzana, lies the province or kingdom of Dembea, where we find Gondar, the modern capital of Abyssinia.

This city, according to the report of a native, almost equals Grand Cairo in extent and population.ⁱ But Bruce reduces the number of its inhabitants to 10,000 families.^k The houses are built of red stone, and roofed with thatch. It contains a hundred Christian churches. One quarter of the city is peopled with Moors. The king's palace resembles a Gothic fort. The trade, which is extensive, is carried on in a vast open space, where the goods are daily exposed on mats. The current media of exchange are gold and salt; sometimes, also, the woollen cloths manufactured at Adorya. The province of Dembea contains also the town of Emfras, consisting of 300 houses, and agreeably situated. This province is remarkably fertile in grain.

To the south of Dembea the Nile winds round the kingdom of Gojam, forming thus a sort of peninsula. This part of the river has a most magnificent waterfall, the whole river falling down from a height of forty feet with tre-

with part of the Lake Tana.

mendous force and noise, into a basin, where it wheels round in numerous eddies. Abounding in all sorts of productions, this province derives its chief riches from its herds of cattle.

To the east of Gojam are found the provinces of Amhara and Begamder; the name of the latter of which signifies "the Sheep Country." It also contains horses, and its inhabitants are very warlike. The mountainous country called Lasta, inhabited by a tribe which is generally independent, contains some iron mines. Amhara, to the south of Begamder, has always passed for one of the principal provinces of Abyssinia, and contains a numerous and brave nobility.^a Here is the famous state-prison of Geshen, or Amba-Geshen, which is now succeeded by Wechneh in the province of Begamder. It seems to consist of steep mountains, which contain either a natural cavern or an artificial excavation, into which the prisoners descend by means of a rope. Here the Abyssinian monarch causes to be kept under his own eye all those princes of his family from whom he thinks he has any thing to apprehend. It is often to this tomb of living beings that the grantees of the kingdom come to select the prince whom, from a regard for his birth, or from pure affection,^b they call to the throne. These barbarous usages, however, vary according to the character of the monarch, and according to the anarchical or comparatively peaceful state of the country.^c

When we have added to these provinces that of Xoa, or Shoa, formed by a large valley very difficult of access,^d and that of Damot, rich in gold, in crystal, and in cattle with monstrous horns;^e we have gone over the Abyssinian empire properly so called. Lobo, who resided for a time in Damot, extols it as the most delightful country he had ever beheld. The air is temperate and healthy, the mountains beautifully shaded with trees, without having the appearance of wild and irregular forests. Vegetation here is perpetually active: the operations of sowing and reaping are common to all seasons of the year, and the whole scene has the aspect of a pleasure-garden. As for Shoa, its ruling prince is stated by Bruce to be rather an ally to the king of Gondar than a vassal.

The more remote provinces are mostly under the yoke of the ferocious Gallas, and other savage tribes hostile to the Abyssinians. To the east are the countries of Angot and Bali: to the south we are told of those of Fatgar, of Yvat, of Cambat, and more especially the kingdom of Enarea, which, from Bruce's account, seems to be a table land watered by several rivers which have no outlet, and deriving a temperate climate from its elevation. The inhabitants, who in the mountains have pretty clear complexions, trade with the people of Melinda on the Indian ocean, and with those of Angola on the Ethiopic. The hilly district of Caffa must be conterminous with Enarea on the south. All the heights are there covered with coffee trees. But this report, from a traveller in other respects not very scrupulous, requires further confirmation.^f

In the topographical sketch of Abyssinia now given, we

observe the mixed nature of the population of this country. We shall first take a glance of the Abyssinians, or, as they call themselves, the Agazians. In their handsome forms, their long hair, and their features, they approach to the European; but they are distinguished from all known races, by a complexion altogether peculiar, which Mr. Bruce compares sometimes to pale ink, sometimes to an olive brown, and which, according to the French Institute of Egypt, seems to partake of a bronze colour. The portraits of the Abyssinians, given by Ludolf and Bruce, betray, however, some traits of similarity to the negroes. When we attend to their language, we find that the Gheez, which is spoken in the kingdom of Tigré, and in which the books of the Abyssinians are written, is regarded by all the learned as a dialect derived from the Arabic.^g The Amharic language, used at the Abyssinian court since the 14th century, and spoken in most of the provinces, has also many Arabic roots, but carries in its syntax evidences of a peculiar origin. The Gheez language, harder than the Arabic, contains five consonants which, to the organs of a European, are unutterable. The Amharic is much softer, but has not that variety of grammatical forms which characterizes the Asiatic languages.^h It would appear, therefore, that Abyssinia, first peopled by an indigenous and primitive race, has received, more especially in its northern and maritime parts, a colony of Arabs, and probably of the tribe of Cush, whose name is, in the prophetic books of Scripture, applied both to a part of Arabia and to Ethiopia.ⁱ This Arabian origin of a part of the Abyssinians explains the reason why several of the Byzantine authors have placed the country of the *Abaseni* in Arabia Felix.

The intimate relations which Abyssinia has maintained with the nations of Asia confirm the opinion of their descent from the Kushite Arabs. The indigenous history of the Abyssinians, so far at least as it is known to us, goes no farther back than the famous Queen of Sheba, who travelled to Judea to admire the magnificence of Solomon. The son whom she bore to the king of the Jews had the two names of David and Menihelc. His descendants continued to reign till the year 960 of the Christian era. Under the two brothers, Abraha and Azbaha, in the year 330, the Christian religion was introduced into Abyssinia. In 522, king Caleb, called also Elesbaan, in alliance with the emperor Justin, fought several campaigns in Arabia against the Jews and the Koreishites. The Zogaic dynasty reigned for 340 years. The most celebrated king of that family, Lalibala, caused several edifices to be cut in the rocks, and among others, ten churches, of which a traveller of the 16th century has given representations in plates. In 1268, the grantees of Shoa reinstated a branch of the old Solomonic dynasty on a throne, of which, twenty years ago,^k it continued in possession. Among the princes of this dynasty, Amda Sion, at the beginning of the 14th century, was a warlike and powerful monarch. Zara Jacob sent to the council of Florence ambassadors, who declared for the eastern church. Under the unfortunate David III. began the connections of Abyssinia with Portugal. His

son Claudius, or Azenaf Segued, a prince of the highest endowments, had to contend at the same time with the ferocious Mahometans who devastated his empire, and the intrigues of the missionaries who laboured to subject him to the authority of the Pope. He kept up the alliance with the Portuguese, who, in 1542, sent him an auxiliary body of 450 men, under the command of Christopher de Gama. That hero died gloriously fighting against a numerous army of Moors, and the king himself lost his life in a subsequent battle. Under the reigns of his successors the intrigues of the Roman Catholics continued without success; and, when at last, in the year 1620, the learned and able father Payz succeeded in making the king Socinios, or Susneus, declare publicly for the church of Rome, the only result was a train of the bloodiest civil wars. In 1632, king Basilides, or Facilidas, put an end to them, by expelling the catholics, and securing the exclusive sway to the Abyssinian church. From that period Abyssinia ceased to be known in Europe. But in 1691, king Yasoos I. sent an embassy to Batavia. This monarch, distinguished for his virtues, repaired to the foot of the famous mount Wechneh, caused all the princes who were immured in that place of confinement to be brought before him, consoled them, passed some weeks in their society, and left them so delighted with his kindness, that they returned voluntarily to their dreary abode. The vices of the children of Yasoos I. favoured for a moment the enterprises of a usurper who filled the throne, and declared in favour of the catholic religion. Yasoos II. spent his leisure hours in studying the arts, particularly architecture. He married a princess from one of the Galla tribes, and his successor, by this marriage, gave occasion to civil wars, by conferring some of the government appointments on the Gallas. At the time of Mr. Bruce's visit, the reigning king, called Tecla Haimanut, succeeded in quieting these troubles; but, dethroned by a rebel prince, he left his country a prey to anarchy. The *ras*, or governor of Tigré, the powerful Wellata Selasse, whom Mr. Salt visited, supports a nominal king who lives at Axum, while Guxo, a Galla chief, has set up another nominal sovereign on the throne of Gondar.^a

Separated from Europe by distrust as well as by natural obstacles, and insulated in the midst of Mahometan and pagan nations, the Abyssinians, though possessing vigour and talent, languish in a condition not unlike that of Europe in the 12th century. Their Christianity, mixed with Jewish practices, admits circumcision in both sexes as a harmless practice. They keep both the Jewish sabbath and the first day of the week. During the great discussions which were held on abstract doctrines respecting the nature of Jesus Christ, the church of Abyssinia was by its geographical position drawn over to the sect of the Monophysites, of which it forms a leading branch along with the Copts of Egypt.^b Yet, in their numerous festivals, in the worship of saints and angels, and in the adoration almost divine which they pay to the Virgin Mary, they come near to the catholicism of the Spaniards and Italians.^c They make use of incense and of holy water.

The sacraments which they acknowledge are baptism, confession, and the eucharist. They take the last in both kinds, and believe in transubstantiation. Their Bible contains the same books as that of the catholics, besides an additional one called the book of Enoch, of which Mr. Bruce brought home three copies.^d In the metropolitan church of Axum, a holy ark is preserved, which is regarded as the palladium of the empire. The Abuna, who is the head of the clergy, and may be compared to the *exarchs*, is nominated by the Coptic patriarch of Alexandria, and is always a foreigner. The monks of the two orders of Saint Eustathius and Saint Tecla Haimanut, make themselves useful in cultivating the ground.^e The marriage of priests is allowed as in the Greek church.

If this religion be, as the Abyssinians pretend, one of the most ancient forms of Christianity, it certainly has little influence on the civilization of the people. Every thing almost is conducted in the same manner as in Turkey. The Abyssinian monarch, an absolute despot, sells the provincial governments to other subordinate despots.^f Some of these governors have contrived to render their dignity hereditary.^g The Vizier or prime minister has the title of *Ras*. The nobility consists of descendants of the royal family, the number of which is augmented by the practice of polygamy, which, though condemned by the church, is kept up by the force of custom, and the influence of the climate. Those princes who have pretensions to the succession are usually kept in the royal prison. According to some authors, there is scarcely such a thing as the right of property; yet other accounts mention a sort of magistrate who taxes the produce, and fixes the sum to be paid by the farmer to the proprietor, a procedure which seems to suppose considerable respect for the rights and interests of the people.^h Justice is administered with great promptitude; punishments of the most barbarous kind seem to be frequent. There are tribunals of twelve persons with a presiding judge, which, like the old Gothic tribunals, hold their court in the open air. The king's revenues consist of supplies of grain, fruit, and honey, with some slender payments in gold. Every three years a tenth part of the cattle is appropriated by the government.ⁱ The army, which is paid by grants of land, amounts to 40,000 men, a tenth part of whom are cavalry. Some carry short firelocks, which they never fire without resting them on a support. The greater part are armed with lances and swords. The bravery of the Abyssinians, not being directed by tactics, has usually no other effect than that of exposing them to extensive carnage. When victorious they give full scope to their ferocity, mutilating the dead bodies of their enemies in a shocking manner, and exhibiting publicly the most indecent trophies of their success.^k

This single feature must excite in our readers a disgust sufficient to suppress all avidity for a detailed description of the manners of the Abyssinians; we shall therefore only subjoin such brief sketches as are necessary. They live in round hovels with conical roofs, a form rendered necessary by the violent rains. A light cotton dress, some pieces

^l This statement is confirmed by Nathaniel Pearce, an English sailor, left in Abyssinia by Lord Valentia, who resided about 15 years in the country.—P.

of Persian carpet, and a few articles of handsome black pottery, form the chief objects of luxury. The children go naked till the age of fifteen.^a The arts and mechanical professions are in a great measure in the hands of strangers, and especially of the Jews.^b To these last belong all the smiths, masons, and thatchers in the country.

The proud indolence of the Abyssinians is shown in their manner of eating. The great lords have servants at table to feed them. It seems certain, after much discussion maintained on the point, that the Abyssinians have no repugnance to raw flesh, accompanied with a gravy of fresh blood, and rather consider it as a delicacy.^c Bruce has perhaps exaggerated in saying that they cut slices from the live ox for immediate use, the blood of the animal staining the entrance, and his bellowings mingling with the festive noise of the company.^d The savage gaiety of these feasts is animated by hydromel in which opium is dissolved. The two sexes indulge publicly in freedoms which to other nations seem licentious, though perhaps not in the gross debaucheries of which they have been accused.^e

Such being the character of the Christians of Abyssinia, we cannot be surprised at any thing in the manners of the more savage nations that live in this country. The ferocity and the dirtiness of the Gallas surpass every idea that can be formed. They live entirely on raw meat; they smear their faces with the blood of the slaughtered animal, and hang the entrails round their necks, or interweave them with their hair. The incursions of these nomade and pastoral tribes are sudden and disastrous. Every living thing is put to the sword; they butcher the infant in the mother's womb; and the youths, after being mutilated, are sold by them into slavery. These people are distinguished from the negroes by their low stature, their deep brown complexions, and their long hair. These African Tartars, who first made their appearance in the countries situated to the south-east of Abyssinia, now occupy five or six great provinces of that empire, as stated in the topography. They are divided into many tribes, which, according to some, are arranged into three national communities. Those of the south are little known; those of the west are called Bertuma-Galla: they have kings, or war-chiefs, called Looob; those of the east are called Boren-Galla, and their chiefs, Mooty. Their chiefs, who, according to Lobo, only enjoy a temporary authority, give audience in wretched hovels. Their guards and courtiers begin by beating with bludgeons any stranger who presents himself; then introduce him into the king's presence, and compliment him as an intrepid fellow who would not suffer himself to be dismissed.^f The Gallas worship trees, stones, the moon, and some of the stars. They believe in magic, and in a future state. The rights of property, marriage, and the support of aged relations, are made binding by their laws. Warriors are allowed to expose their children. In their distant expeditions across desert countries, they live on pounded coffee.

The Abyssinians consider the Gallas as originally belonging to the east coast of Africa. Their name seems to figure among the nations which were vanquished or subjugated

by Ptolemy Philadelphus, according to the inscription of Adulis. When, along with these circumstances, we take into view the physical features which distinguish them from the negroes, we must at once reject the hypothesis of some geographers, who would represent them as a colony of the Galla negroes of the Pepper Coast. They belong more probably to the nomade tribes of southern central Africa.

The other pagan and savage races are not quite so formidable. In the north-west parts, and to the east of the river Tacazze, the Shanga'la^g inhabit the wooded heights which are called Kolla by the Abyssinians. The visages of these negroes bear a resemblance to those of apes. They spend one part of the year under the shade of trees, and the rest in caverns, which have been dug in the soft sandstone rocks. Some of these tribes live on elephants and rhinoceroses, others on lions and boars; one of them feeds on locusts. They go quite naked, and are armed with poisoned arrows. The Abyssinians hunt them like wild beasts. These tribes, the description of which forms one of the most valuable parts of Mr. Bruce's account,^h were long ago designated by ancient authors under the name of locust-eaters, ostrich-eaters, and elephant-eaters.ⁱ The nature of the soil, alternately covered with water, and baked and cracked into chinks by the violent heat, excludes every sort of culture.

There are two nations called Agows. The one lives in the province of Lasta, round the sources of the Tacazze, the other possesses the neighbourhood of the sources of the Nile of Abyssinia. Possessing fertile but inaccessible countries, courageous, and provided with good cavalry, they maintain their independence both against the Gallas and Abyssinians. The Agows of the Nile furnish Gondar with beef, butter, and honey. Although they retain some traces of the progress which the Christian religion formerly made among them, their principal worship is addressed to the spirit whom they consider as presiding over the sources of the Nile. Every year they sacrifice a cow to that spirit, and some neighbouring tribes, among whom are the Gafats, join in the sacrifice.

The Gafats are a numerous people, who speak a distinct language, and live in Damot. Their country produces very fine cotton.

The Gurags, a set of expert and intrepid robbers, live in the hollows of rocks to the south-east of Abyssinia. Bermudas places them in the kingdom of Oggy, contained in the list of provinces given by Petit-la-Croix.^k "This country," says that author, "produces musk, amber, sandal-wood, and ebony, and is visited by white merchants."

Of all the inhabitants of Abyssinia, the Jews, called Falasja, or "the exiled," present the most extraordinary historical curiosity. That nation seems to have formed for centuries a state more or less independent in the province of Samen, under a dynasty, the kings of which always bore the name of Gideon, and the queens that of Judith.^l That family being now extinct, the Falasja submit to the king of Abyssinia.^m They exercise the vocations of

^a Petit-la-Croix, ch. 11.

^b Ludolf, l. IV. c. 5. Petit-la-Croix, ch. 9, &c.

^c Bruns, Afrika, II. 137.

^d This statement is also confirmed by Pearce. The same fact was stated to Dr. Clarke, by an Abyssinian priest examined by him at Cairo, and to Sir W. Jones, by Abram, an Abyssinian. Lobo also states, that the Gallas and Abyssinians are fond of meat quite warm, and that it is their practice to serve up a quarter as soon as killed.—P.

weavers, smiths, and carpenters. At Gondar they are considered as sorcerers, who during the night assume the form of hyænas. According to Ludolf, they had synagogues and Hebrew Bibles, and spoke a corrupt dialect of Hebrew.^a Bruce asserts that they have the sacred books only in the Gheez language; that they have lost all knowledge of the Hebrew, speak a jargon peculiar to themselves, and know nothing of the Talmud, the Targum, or the Cabbala. The greater part of the Falasjas live on the Bahr-el-Abiad among the Shillooks. This is the very country that was occupied by the Egyptian exiles, the Asmach and Sebridæ. Perhaps a company of Egyptian Jews followed the steps of these emigrants, and it is not unlikely that they have been mixed together.

Travellers, both ancient and modern, agree in comprehending all the African coasts, from Egypt to the strait of Bab-el-Mandeb, under the general name of Troglodytica, the coast of Abex, or Habesh, or New Arabia. There is nothing to prevent us from adopting this division, interesting^a both in relation to history and to physical geography. We have found that neither Nubia nor Abyssinia have any fixed limits: and an Arabian geographer of great weight, Abulfeda, makes a formal distinction between Nubia and the maritime parts.^b

The ancients, whom we must often take for our guides, represent the chain of mountains which skirts the Arabian Gulf as very rich in metals and precious stones. Agatharchides^c and Diodorus^d make mention of mines of gold which were worked. These were contained in a white rock, probably granitic. Pliny makes these riches common to all the mountainous region between the Nile and the Gulf.^e The Arabian geographers have confirmed these accounts, as well as those which relate to a quarry of emeralds. But the excessive heat and the scarcity of water render the low part of the coast almost uninhabitable. Cisterns must be every where used, as there are no springs.^f In the dry season the elephants dig holes with their trunks and their teeth to find water. The Etesian, or north-east winds, bring the periodical rains.^g The small lakes or pools which abound on the coast are then filled with rain water. Palms, laurels, olive trees, styraxes, and other aromatic trees, cover the islands and low coasts. In the woods are found the elephant, the giraffe, the ant-eater, and many species of monkeys. The sea, which is not very deep, is green like a meadow, from the great quantity of algæ and other marine plants which it nourishes. It likewise contains much coral.

The nature of the soil and climate has, in all ages, kept the inhabitants in a uniform state of savage wretchedness. Divided into tribes, and subject to hereditary chiefs, they lived formerly, and still live, on the produce of their flocks of goats, and by fishing. The hollows of the rocks were and still are their ordinary dwellings. From these caverns, called in Greek *trogla* (τρογλη), is derived the general name under which they were designated by the ancients. That kind of lodging was anciently used in many other countries of the globe. We find Troglodytes at the foot of

Caucasus and of Mount Atlas, in Mœsia, in Italy, and in Sicily. This last mentioned island contains an example of a whole city, formed by excavation in the interior of a mountain.^h But of all the races that have dwelt in caverns, those of the Arabian Gulf have longest preserved the habits and the name of Troglodytes.

According to the ancients, these people are of Arabian origin. Bruce comprehends them under the general name of Agazi or Gheez, which means shepherds. They speak the Gheez language, which is a dialect of the Arabic. The uncouth and singular sounds of this language made the ancients say that the Troglodytes hissed and howled instead of speaking. They were said to practise circumcision on both sexes. They employed a barbarous custom, which is used at this day among the Kora-Hottentots, that of a partial castration.ⁱ In ancient times they observed none of the laws of marriage; the wives of the chiefs of tribes were the only women who could be said to have husbands.^k They painted their whole bodies with whiting,^l and hung round their necks shells, which they believed to have the power of protecting them from sorcery. Some of these tribes killed none of their domestic animals, but lived on their milk, as the Hazorta still do; others ate serpents and locusts, a food still relished by various tribes of the Shangallas; finally, there were among them some who devoured the flesh and bones of animals mashed together, and cooked in the skin. They manufactured a vinous liquor from certain wild fruits. The most wretched among them repaired in flocks, like cattle, to the lakes or pools, to allay their thirst. This picture of the ancient Troglodytes is in a great measure applicable to the present inhabitants of these coasts.

Mr. Belzoni, who, in his excursion to the Red Sea, came near the countries now under consideration, met with a fisherman, who was probably a fair specimen of that department of the population.^m He lived in a tent only five feet wide, with his wife, daughter, and son-in-law. He had no boat, but went to sea on the trunk of a doomt tree,ⁿ ten or twelve feet long, with a horizontal piece of wood at each end, to prevent it from turning round; a small hole for a mast; and a shawl for a sail, managed by means of a cord. On this apparatus two fishermen mount as on horseback, carrying a long spear, which they dart at the fish when they see them. The weather requires to be very favourable when they go to sea, this being impracticable during the east, and dangerous in west winds.

We shall begin the topography of the coast with the promontory Ras-el-enf, or the *Mons Smaragdus* of the ancients. Mr. Bruce places opposite to this Cape an "Isle of Emeralds," where he found fine green crystals of fluor spar. But the famous emerald mine, which was worked by the Egyptians, was on the continent. The Arabian geographers place it in a more southerly latitude than Assouan or Syene. They say that the mountain is shaped like a bridge, and that the emeralds are found sometimes in sand, sometimes in a blackish gangue.^o Some moderns have given vague confirmations of the existence of this

mine.^a We believe it to be the same which was visited by Belzoni. Pliny extols its precious stones for their hardness,^b and they are in great request in the east, under the name of "emeralds of the Saïd."^c

Zemorget Island, which is farther from the continent than the Isle of Emeralds, passes for the Topaz Island of the ancients.^d It is a barren rock, and was inhabited only by serpents, when chance led to the discovery of a quarry of precious stones, which the ancients called topazes, and the working of them was undertaken by the kings of Egypt.

The coast makes a great concave sweep, called, by ancient and modern navigators, Foul Bay. At the bottom of this gulf is the port of the Abyssinians.^e The Arabian geographers give the coast next south of this port, the name of Baza, Beja, or Bodsha. According to them it is a kingdom separated from Nubia by a chain of mountains, rich in gold, silver, and emeralds.^f We have very discordant accounts, both of the orthography of the name and the boundaries of the country. The name of Baza is found in that of the promontory called *Bazium* by the ancients, and now Ras-el-Comol. The inhabitants of this country, who are called Bugiha by Leo Africanus, *Bogaites*^g in the inscription at Axum, and Bedjah by the generality of the Arabians, lead a nomade and savage life. They derive abundant aliment from the milk and flesh of their camels, cattle, and sheep; every father exercises a patriarchal rule in his family, and they have no other government. Full of loyalty to one another, and hospitable to strangers, they continually rob the neighbouring agriculturists, and the trading caravans. Their cattle have horns of enormous size, and their sheep are spotted. The men are all subjected to the barbarous and indecent mutilation already mentioned of the Troglodytes and the Kora-Hottentots.^h There are some tribes among them in which the front teeth are extracted; and there is a society of women who manufacture arms, and lead the lives of Amazons.ⁱ The custom of hanging up a garment on the end of a pike as a signal of peace, and for commanding silence, is common to them with the Hazorta, a tribe on the coast of Abyssinia.^k Bruce asserts that they speak a dialect of the Gheez, or Abyssinian language. But the Arabian historian of Nubia makes them belong to the race of Berbers, or Barabras. A learned orientalist, M. Quatremère, has endeavoured to demonstrate the identity of the Bugihis or Bejahs, with the *Blemmyes* of the ancients, or the *Balнемois* of the Coptic writers. The descriptions of the ancients appear to us to apply more naturally to the Ababdeh. The other hypothesis is formally contradicted by a passage of Strabo. "The Megabari," says that geographer, "and the Blemmyes, live below Meroë, on the banks of the Nile nearest the Red Sea. They are neighbours to the Egyptians, and subject to the Ethiopians, but on the sea shore live the Troglodytes."^l From this passage we must

consider the Megabaris as chiefly represented by the Makorra of the historian Abdallah, the Blemmyes by the Ababdeh, and the Troglodytes by the Bejahs.

The port of Aidab, called Gidid by the Portuguese, long served as a point of communication between Africa and Arabia. It was a great place of embarkation for Mahometan pilgrims bound to Mecca. The Samoom wind renders this place scarcely habitable.

Suakem, called Szawaken,^m by M. Seetzen, in the latitude of Dongola in Nubia, is now the most frequented port. The town is surrounded with some redoubts, and is mostly built on an island. It possesses mosques and even schools, and has a garrison appointed by the Sherif of Mecca. The adjoining coast has no river, and is badly supplied with fresh water; it contains calcareous rock, potters clay, and red ochre, but no metals. Here some dourra, tobacco, water-melons, and sugar-cane, are cultivated. Among its trees we find the sycamore, which, as well as the *Persea*,ⁿ the ancients mention as growing in Troglodytica. The forests consist of ebony trees, gum-trees or acacias, and many varieties of palms. There is a large tree which produces a fruit resembling grapes. Here are found the giraffe and numerous herds of elephants. The sea yields pearls and black coral. Besides all these productions, the town exports slaves and gold rings brought from Soodan.^o The inhabitants of Suakem, and those of Hallinga-Taka, the adjoining tribe of the Bishareens, and that of Hadindoa, speak a peculiar language.^p

The promontory of Ras-Ageeg, or Ahehas, seems to be the termination of the Bejah, or Bodja, or Baza country. After this promontory comes a desert coast lined with islets and rocks. It was here that the Ptolemies procured the elephants which they required for their armies. Here Lord Valentia found a large harbour, to which he gave the name of Port Mornington. The first considerable island met with is called Dahalac, the largest indeed belonging to the Arabian Gulf, being more than sixty miles^q in circumference. It is level on the side towards the continent, but rises eastward, and has a rocky precipitous coast towards the sea.^r It contains goats with long silky hair, and furnishes a sort of gum-lac, the produce of a particular shrub.^s The pearls formerly got here had a yellowish water, and were of little value.^t To this island vessels repair for fresh water,^u which, however, according to Mr. Bruce's account, is very bad, being kept in 370 dirty cisterns.

In the gulf formed between this island and the coast is found Masuah, or Matzua, an arid rock, with a bad fortress and a very good harbour. It is here that travellers land who go to Abyssinia by sea. At the bottom of the gulf the town of Arkeeko commands an anchorage, which is exposed to the north-east winds. It contains 400 houses, some of which are built of clay, and others of plaited grass.^x

This low, sandy, and burning coast, called Samhar, is the scene of the wanderings of different nomade tribes, as the Shihos, who are very black in complexion, and the Hazortas, who are small and copper-coloured. These people, like the ancient Troglodytes, inhabit holes in the rocks, or hovels made of rushes and sea-weed. Leading a pastoral life, they change their dwelling according as the rains give rise to a little verdure on the burnt soil; for, when the rainy season ends in the plains, it begins among the mountains.

The Turks, who have been masters of this coast since the sixteenth century, gave the government of it to an Arab Sheik of the Bellowe tribe, who has the title of Naib. But, according to recent accounts, it appears that the governor of Abyssinia and of Tigré, has resumed his ancient influence over this part of the Abyssinian empire.^a The last traveller, Mr. Salt, found the Naib independent of the Turks, and acknowledging the power of the Ras of Tigré.

The government of the coast, called in ancient accounts

the territory of the Bahar-Nagash, that is, "the king of the Sea," formerly extended from Saukem to the south of the Straits of Bab-el-Mandeb. Dobarva, or Barva, its ancient capital, was, in Bruce's time, in the hands of the Naib of Massua. This town, situated on the Mareb, is considered as the key of Abyssinia towards the sea. During the existence of the Portuguese influence it was a place of great trade,^b but it was not visited by Mr. Salt.

To the south of Samhar, the coast takes the name of Dankali, or, as Niebuhr calls it, Denakil,^c a sandy country from which salt is obtained, and the chief port of which is Bayloor. The inhabitants are called Taltals, and, though Mahometans, are in alliance with Abyssinia.

The country round the strait of Bab-el-Mandeb is, in the best modern maps, called Adeil; but we know not whether it belongs to Abyssinia, or, as the name seems to indicate, to the kingdom of Adel. Bruce mentions some magnificent ruins at Assab, the chief port of this province, but gives a very obscure account of them.

BOOK LXIV.

THE REGION OF MOUNT ATLAS OR BARBARY, AND THE GREAT DESERT OR ZAHARA

PART I.

General features of these Countries.

FROM the Egyptian Delta and the pyramids, we have ascended the Nile as far as we enjoyed the assistance of history and of the journals of European travellers. Before attempting to penetrate the mysterious centre of northern Africa, we shall complete our view of its more accessible parts, turning our attention in the first place to mount Atlas, and the pillars of Hercules.

A straight line passing from the cataracts of the Nile to Cape Blanco, or the mouth of the Senegal, will form the southern boundary of the region now to be described. Here physical geography presents us with two leading and characteristic phenomena, the greatest desert in the known world, and one of the most extensive mountain chains. These two features belong to two distinct regions. We shall first trace that of Mount Atlas, to which the common practice of Arabian and European geographers has given the name of Barbary, or more properly Berbery, from the Arabic name of the most ancient indigenous race of its inhabitants.

Mount Atlas has a certain degree of poetical celebrity, being represented by Homer and Herodotus as one of the pillars of heaven. According to Virgil, "Atlas is a hero metamorphosed into a rock. His robust limbs are converted into pillars; he bears on his shoulders the entire heavens, with all their orbs, without feeling oppression from their weight. His head, crowned with a forest of pines, is continually girt with clouds, or beaten by winds and storms. A mantle of snow covers his shoulders, and rapid torrents flow down his venerable beard." But this famous mountain is at present obscurely known to Europeans, and we wait for some fortunate traveller to give us a satisfactory and complete description of it. M. Desfontaines, who with the eyes of a learned botanist surveyed a great part of this system of mountains, considers it as divided into two leading chains. The southern one, adjoining the desert, is called the Great Atlas, the other lying towards the Mediterranean is called the little chain. Both run east and west, and are connected together by several intermediate mountains running north and south, and containing between them both valleys and table lands. This description, though general and rather vague, is the clearest that we possess. It is easily reconciled with the account given by Shaw, who describes Atlas as a series consisting of many ranges of hills successively increasing in elevation, and ter-

minating in steep and inaccessible peaks.^a But it is worthy of remark, that the great and little Atlas of Ptolemy, the one of which is terminated at Cape Felneh, and the other at Cape Cantin, differ from the chains of the French traveller, being lateral branches which go off from the main system, to form promontories on the sea coast. Another question is, whether the principal chain is continued without interruption to the east of the lesser Syrtis? or do the mountains of Tripoli, or Fezzan, and of Barca, form separate systems? The Arabian geographers seem inclined to the former opinion,^b and no person is prepared to contradict them. They tell us that "Mount Daran extends eastward from Sus in Morocco, joins the mountains of Tripoli, and then is lost in a plain." These expressions are not inconsistent with the belief that Atlas is completely terminated to the south of the Great Syrtis, from whence it is probable that a low lying territory extends a great way into the interior.

The great height of Mount Atlas is proved by the perpetual snows which cover its summits in the east part of Morocco, under the latitude of 32°. According to Humboldt's principles, these summits must be 12,000 feet^d above the level of the sea. Leo Africanus, who travelled there in the month of October, narrowly escaped being buried by an avalanche of snow. In the state of Algiers, the snow disappears on the tops of Jurjura and of Felizia in the month of May, and covers them again before the end of September.^e The Wanashisre, situated in 35° 55', and forming an intermediate chain between the maritime one and that of the interior, is covered with a mantle of snow nearly the whole of the year.^f Even to the east, where the elevation appears to diminish, the Gariano or Garean mountains to the south of Tripoli, are covered with snow for three months.

The ingredients of the rocks have not been sufficiently investigated. In the parts belonging to Tunis, Algiers, and Morocco, which were visited by M. Desfontaines, the chain of the Atlas is formed of limestone,^g and this gentleman adds that he found in the mountains large heaps of shells and marine bodies, at a great distance from the sea; a phenomenon noticed by all modern travellers,^h and which also struck the less observant minds of the ancients.ⁱ Some of the elegant marbles of Numidia, exhausted by Roman luxury, were of a uniform yellow, others were spotted with various colours.^k The Carthaginians

employed them previously to the Romans, for constructing pavements in mosaic. But the copper, iron, lead, and other mines, worked in Morocco and Algiers, show the existence of schistous or granitic rocks. M. Pioret informs us, that in the neighbourhood of Bona, a maritime town of the kingdom of Algiers, the rocks are of quartz mixed with mica,^a and Shaw mentions that a sort of sandstone is employed for building in Algiers.^b The hills which terminate the Atlas in the desert of Barca, are calcareous masses surmounted by a crest of basalt. Such at least is the case with the mountain of Harutch, observed by Hornemann. According to Pliny, that side of the Atlas which looks toward the Ocean, that is, the southern side, raises its arid and dark masses abruptly from the bosom of a sea of sand, while the more gentle northern declivity is adorned with beautiful forests and verdant pastures.^c

But was the chain of mountains now described really the Atlas of the ancients? This is denied by a learned German, who reasons in the following manner.

“In the earliest periods of history the Phenicians ventured to pass the Strait of Gibraltar. On the shores of the Atlantic they founded Gades and Tartessus in Spain, and Lixus and several other cities in Mauritania. From these settlements they navigated northward to the Cassiterides, where they procured tin, and to the coast of Prussia, where they found amber. In the south they proceeded beyond Madeira to the islands of Cape Verd.—They frequented, more especially, the archipelago of the Canaries. Here they were astonished at the sight of the Peak of Teneriffe, the height of which, in itself very great, appears still greater by shooting up immediately from the surface of the ocean. The colonies which they sent to Greece, and more especially that which, under the conduct of Cadmus, settled in Bœotia, brought to these countries some information respecting that mountain which towered above the region of the clouds, and the Happy Islands^d over which it presides, embellished with oranges, called in their phraseology, golden apples. This tradition, propagated over Greece by the verses of the poets, was handed down to the era of Homer. His Atlas has its foundation in the depths of the ocean, and its lofty pillars reach from earth to heaven.^e The Elysian Fields^f are described as an enchanting country, situated somewhere in the west. Hesiod speaks of Atlas in a similar style, describing that personage as the near neighbour^g of the Hesperian nymphs.^h He calls the Elysian Fields the Islands of the Blessed, and places them at the western extremity of the earth.^k Later poets added new embellishments to the fables of Atlas and the Hesperides, their golden apples, and the Islands of the Blessed, the destined habitation of the righteous after death. They have also connected the expeditions of Melicertes, the Tyrian god of commerce, and those of the Grecian Hercules. It was at a comparatively late period that the Greeks began to rival the Carthaginians and Phenicians in navigation. They visited the shores of the Atlantic Ocean, yet it does not appear that their voyages in that ocean were greatly extended. It is doubtful

whether or not they ever saw the Peak of Teneriffe and the Canary Islands, for they thought it necessary to search on the west coast of Africa for the Atlas which their poets and their traditions had represented to them as a very lofty mountain situated at the western extremity of the earth. It is thus that Strabo, Ptolemy, and other geographers, have altered its position. But since there is not found in the north-west of Africa any mountain of remarkable height”—(this is a mistake)—“much difficulty arose in recognizing the true position of Atlas. Sometimes search was made for it on the coast, sometimes in the interior of the country, sometimes near the Mediterranean sea, sometimes farther to the south. In the first century of our era, when the Romans carried their arms into the interior of Mauritania and Numidia, the habit sprung up of giving the name of Atlas to the chain of mountains in the north of Africa, which extends from east to west, in a direction nearly parallel to the coast of the Mediterranean. Pliny and Solinus perceived that the descriptions of Atlas given by the Greek and Roman poets did not apply to this chain of mountains. They, therefore, thought it necessary to find in the unknown part of central Africa a locality for this Peak, of which, while they copied poetical traditions, they drew so agreeable a picture. But the Atlas of Homer and Hesiod can only be the Peak of Teneriffe, while the Atlas of the Greek or the Roman geographers must be found in the north of Africa.”^l

This reasoning we cannot consider as well founded. The passages referred to in Homer, Hesiod, and Herodotus, are extremely vague. The Atlas of Herodotus might be a promontory of the southern chain, rising from the plains of the desert, such as Mount Saluban in Bildulgerid appears to be. It agrees with the distances assigned by this historian. It is besides possible, that all these contradictions may owe their origin to that optical illusion by which a chain of mountains seen in the direction of its length has the appearance of a narrow peak. “When at sea,” says Humboldt, “I have often mistaken long chains for isolated mountains.” This explanation might be still further simplified, if it were admitted that the name of Atlas belonged originally to a promontory remarkable for its form and its peculiar isolated situation, such as many of those on the coast of Morocco. A curious passage in Maximus Tyrius seems to countenance this hypothesis; “The Hesperian Ethiopians,” says he,^m “worship Mount Atlas, who is both their temple and their idol. This Atlas is a mountain of moderate elevation, concave and open towards the sea in the form of an amphitheatre. Half way from the mountain a great valley extends, which is remarkably fertile, and adorned with richly laden fruit trees. The eye plunges into this valley as into a deep well, but the precipice is too steep for any person to venture to descend, and the descent is prohibited by feelings of religious awe. The most wonderful thing is to see the waves of the ocean at high water overspreading the adjoining plains, but stopping short before Mount Atlas, and standing up like a wall, without penetrating into the hollow of the valley, though

Peak of Teneriffe rising in full view of the rich fields of that island, (the gardens of the Hesperides).—P.

^g Προπαρ, ante, e regione, before, opposite. This might apply to the western chain of Atlas, fronting the Atlantic and the Canaries, or to the

not restrained by any earthly barrier. Nothing but the air and the sacred grove prevent the water from reaching the mountain. Such is the temple and the god of the Libyans; such the object of their worship and the witness of their oaths." In the physical delineations contained in this account we perceive some features of resemblance to the coast between Cape Tefelneh and Cape Geer, which resembles an amphitheatre crowned with a series of detached rocks.^a In the moral description, we find traces of fetichism; rocks remarkable for their shape being still worshipped by some negro tribes.

Leaving these dubious questions to the sagacity of authors who make them a subject of express research, we shall now give a view of the actual physical geography of the region of Mount Atlas.

The fertility of this part of Africa was celebrated by Strabo and Pliny. The latter extols its figs,^b olives,^c corn,^d and valuable woods.^e He observes that the wines had a certain sharpness, which was corrected by adding to them a little lime,^f and that the vineyards had a northern and western exposure.^g Strabo says that the vine trunks were sometimes so thick that two men could scarcely clasp them round, and that the clusters were a cubit in length.^h A horrible government, and a total absence of civilization, have not succeeded in annihilating these bounties of nature. Barbary and Morocco still export large quantities of grain. The olive tree is superior here to that of Provence,ⁱ and the Moors, notwithstanding the hostility to Bacchus which marks their religion, cultivate seven varieties of the vine. The soil of the plains in many places resembles that of the rest of Africa, being light and sandy, and containing numerous rocks: but the valleys of Mount Atlas, and those of the small streams which descend from it to the Mediterranean, are covered with a fertile, and well watered soil. Hence, the most common native plants flourish on the shores, or strike their roots deep into the moveable sands, while the rarest species grow in the marshes and the forests. The arid shores are covered with numerous saline and succulent plants, such as the *Salsola* and *Salicornia*, the *Panicratium maritimum*, and the *Scilla maritima*, with different species of tough long-rooted grasses, such as the *Lygeum spartum*, the *Panicum numidianum*, the *Saccharum cylindricum*, and the *Agrostis pungens*, mixed here and there with the *Heliotropium* and *Soldanella*.^k The dry and stony table-lands which lie between the valleys of the interior, greatly resemble the downs (*landes*) of Spain. They abound in scattered groves of cork trees, and evergreen oaks, under whose shadow sage, lavender, and other aromatic plants, grow in great abundance, and rise to an extraordinary height. The tall-stemmed *genista*, the different species of *cistus*, mignonette, sumac, heath, *aloe*, *agave*, and many species of *euphorbia* and *cactus*, adorn the windings and clefts of the rocks, where, braving the heat and drought, they furnish a shade and a wholesome food for the goats.

The forests which cover the sides of the mountains in the northern parts of these countries are, according to

M. Desfontaines, composed of different species of oaks, as the *Quercus ilex*, *coccifera*, and *ballota*, the acorns of which form part of the food of the inhabitants. The mastic tree, the *Pistacia Atlantica*, the *Thuya articulata*, and the *Rhus pentaphyllum*, are frequently found here. The large cypress, like a verdant pyramid, stretches its branches towards heaven; the wild olive yields excellent fruit without culture. The *Arbutus unedo* bears a red fruit resembling strawberries. The arborescent heath^l diffuses widely its delightful perfumes. All the valleys that have a moderate elevation form in April and May so many Elysiums. The shade, the coolness, the bright verdure, the diversity of the flowers, and the mixture of agreeable odours, combine to charm the senses of the botanist, who, amidst such scenes, might forget his native country, were he not shocked and alarmed by the barbarity of the inhabitants.^m On the coasts and in the plains, the orange-tree, the myrtle, the lupin, the virgin's bower, and the *narcissus*, are, in the month of January, covered with flowers and young leaves. But in June, July, August, and September, the parched and cracked soil is only covered with the yellow remains of dead and withering plants. The cork tree darkens the forest with the gloom of its scorched bark. Yet at this season,ⁿ the rose-bay^o displays its bright flowers on the banks of all the torrents and rivers, from the tops of the mountains down to the deepest valleys.

Among the cultivated plants are wheat, barley, maize, the *Holcus sorghum*, and the *Holcus saccharatus*; rice in the lands capable of being inundated, tobacco, dates, olives, oranges, figs, almonds, vines, apricots, pistachio nuts, jujubes, melons, pumpkins, saffron, the white mulberry, the *Indigofera glauca*, and the sugar-cane. The gardens yield almost all the culinary vegetables known in Europe. The inhabitants of these countries preserve their grain for several years, by burying it in large holes in dry situations. Wheat is sown in autumn, and gathered in April or May. Maize and the *sorghum* are sown in spring, and harvested in summer.^p Oats grow spontaneously.^q Some of the fruits, such as the fig,^r are inferior in quality to those of Europe; but the acorns of the oak taste like our chestnuts.^s

The animal kingdom comprehends most of the species known in the rest of Africa; we must except from these the rhinoceros, the hippopotamus, the giraffe, the zebra, and several of the monkeys.

Nature has supplied the inhabitants of the desert of Zahara with the means of crossing the immense deserts of western Africa in a few days. Mounted on the *heiree*, or camel of the desert, which resembles the dromedary, and is only distinguished from it by greater elegance of figure, the Arab, after tying up his loins, his breast, and his ears, to protect himself from the blasts of a dangerous wind, traverses with the speed of an arrow that burning desert, the fiery atmosphere of which deeply affects respiration, and is almost sufficient to suffocate any unwary traveller. The motions of this animal are so harsh and violent, that no person could bear them without all the patience, the abstinence,

and toilsome habits of the Arabs. The most indifferent variety of these camels is called *talayee*, a term denoting that the animal cannot accomplish more than three ordinary days' journey in a day. The most abundant variety called *sebayee* can make out seven. There is a kind which accomplishes nine, and is called *tasayee*, but these are exceedingly rare, and bring enormous prices. The Arab in his figurative phraseology thus describes the swiftness of the camel of the desert—"When you meet a *heiree*, and say to the rider *salem alik*, (peace be with you,) he is out of sight before he can return the *alik salem*, for he flies like the wind." Mr. Jackson relates facts on this subject which are almost incredible. A *heiree* arrived at Mogadore, in seven days from the Senegal, having traversed 14 degrees of latitude, and, including the windings of the road, had travelled 1000, or 1100 English miles, making about 150 in a day. A Moor of Mogadore mounted his *heiree* in the morning, went to Morocco, which is 100 English miles distant, and returned in the evening of the same day with a parcel of oranges for which one of his women had longed. Mr. Jackson allows that these facts put the faith of the reader to a severe test; but three older travellers give similar accounts. It is at the same time added, that camels of this quality are but few.^a Geography might receive some interesting accessions, if Europeans, well armed, and in sufficient number, could procure these fleet creatures, and learn to ride them, in order to explore the deserts of northern Africa. Asses are also used, and are of two sorts, the one strong and large, the other very small. Morocco produces fine horses of the Arabian breed. In the whole of Barbary the cattle are small and lean; the cows give little milk, and that of an unpleasant taste.—Goats and sheep are plenty. Pigs being held in abhorrence among Mahometans, are only found in the houses of Europeans. Cats, dogs, and European poultry, are common. The Arabs breed a great many bees.^b

The panther has in all periods been a famous animal, but it is only within these few years that he has been described with precision.^c The ounce and leopard of Buffon seem to be the panther at different ages; yet it would be rash to expunge them at once from the list of quadrupeds. The *bubalis*, an animal of the antelope kind, belongs to the deserts of the north of Africa. It lives in a gregarious state, and flocks of them come to the pools and canals of Egypt to assuage their thirst. The hieroglyphics in the temples of Upper Egypt contain several figures evidently representing this animal. Among the other animals of the same genus common in these countries, the *pasan* is the most frequent, then the *corinne*, which differs very little from the *kevel*, and the proper gazelle.^d In the forests and deserts are found the elephant, the lion, the African boar, two species of the *hyæna*, the ferret, which lives in the bushes, and some apes, among which are the *mona*^e and the *magot*.^f According to a conjecture of M. Walckenaer, the rats seen by Windhus the traveller, in the neighbourhood of Mequinez, "rats as large as rabbits, and which like them burrow in the earth," were the *arctomys gundi*, a species of marmot. It has been disputed whether

there are any bears in Africa. The learned Cuvier doubts their existence in such southerly latitudes, but Baldæus, a well-informed writer, says that he saw them in Ceylon.^g It cannot be denied, that two grave authors, Herodotus and Strabo, assert the existence of the bear in Africa, distinguishing him from the lion and from the panther. Dion, or his abridger Xiphilin, makes a similar assertion. Virgil, Juvenal, and Martial, might be quoted to the same effect.^h Aristotle does not expressly exclude the bear from Africa.ⁱ On these accounts we ought not yet to reject the testimony of modern travellers, who maintain the existence of this animal in the higher parts of Mount Atlas, only acknowledging that it cannot be very common.^k

Ostrich hunting is a curious amusement of this country. Some twenty Arabs, mounted on the horses of the desert, which are as transcendent among horses as the *heiree* is among camels, proceed to windward in quest of an ostrich track, and when they have found one, follow it in a body with the utmost rapidity, keeping at the distance of half a mile from one another. The ostrich, fatigued with running against the wind, which beats against his wings, turns on the hunters and attempts to penetrate their line; but they surround him, and fire all together on the bird, till he falls. Without this address they could never take the ostrich, which, though deprived of the power of flying, surpasses in running the swiftest animals.

The south wind brings along with it clouds of locusts, which, by devastating the fields, create famines, and often cover the ground so completely, as to make a traveller lose his way.^l The wild bee fills the trunks of the trees with aromatic honey, and with wax, which are gathered by the inhabitants in great abundance.^m

To the preceding physical delineation, which is applicable to the States of Tripoli, Tunis, Algiers, and Morocco, we shall subjoin an equally general view of the inhabitants.

The inhabitants of the towns and cultivated plains are distinguished by the name of Moors. Though they speak a dialect of the Arabic, abounding in expressions peculiar to themselves, their physical constitution, their complexion, which is whiter than that of the Arabs, their countenance, which is more full, the less elevated nose, and less expressive physiognomy, seem to show that they are descended from a mixture of the ancient Mauritians and Numideans, with the Phenicians, Romans and Arabians. Since Sallust asserts, that the Numidians and Mauritians had sprung from an Asiatic colony, composed of Medes, Armenians, and Persians,ⁿ it would be an interesting thing to examine thoroughly the characteristic idioms of the Moorish language.^o The accounts given by European travellers make the moral character of this nation a compound of every vice. Avaricious and debauched, bloodthirsty and effeminate, greedy yet idle, revengeful yet fawning, they do not redeem these vices by a single good quality: But may we not suppose that the hatred which the Moors have vowed against their Christian persecutors, ever since they were driven out of Spain, has excited cor-

responding feelings among our travellers? The Moors are Mahometans, and belong chiefly to the fanatical sect called Maleki. They, like the fanatics of many other religions, consider their piety as compensating for every moral defect, and heresy as a stain which can scarcely be rendered more tolerable by the brightest assemblage of moral virtues. They have among them many saints; some distinguished by their absolute inaction, others by a turbulent and mischievous insanity. These last have been seen to knock down an ass, and devour the flesh still reeking and bloody.^a Several of the emperor's horses have been raised to the dignity of saintship: one, in particular, when Commodore Stewart was there,^b was held in such reverence by the monarch, that any person who had committed the most enormous crime, or had even killed a prince of the blood royal, was perfectly secure as soon as he laid hold of the sainted animal. Several Christian captives had by this manœuvre saved their lives. When his majesty intended to confer a signal mark of favour, he and his horse drank successively from the same bowl, and then caused it to be handed to the distinguished individual. These people are addicted in an uncommon degree to a superstitious belief in the influence of evil eyes. An emperor of Morocco kept his son in a state of rigorous confinement, to preserve him from that fatal influence. One part of their marriage ceremonies is to make a solemn procession for the express purpose of ascertaining the purity of the betrothed maid. In no part of the world do the men discover more sensitive jealousy, both before and after wedlock. In Morocco, and through the whole interior, the Moors are temperate in their eating, and simple in their dress; but in Tunis and Algiers the women wear elegant dresses, glittering with gold and diamonds.^c The whiteness of their skin is only discovered by their bare feet. To be able to read the Alcoran is in the eyes of most Moors the summit of polite learning. They have also their astrologers, and they are fond of history and poetry. Their square flat-roofed houses are sometimes ornamented in the interior with rich carpets and spouting fountains. Horse-exercises, and shooting-matches, with feats of rope-dancing, form their favourite pastimes. At their funerals, a long train of women paid for crying and howling, accompanies the dead bodies to their tombs.

The nomade Arabs, who brought hither the Mahometan religion from Asia, and who have arrived since that period, preserve the purity of their race, which is distinguished by a more masculine physiognomy, more lively eyes, and almost olive complexions. Their women, destitute of personal attractions, enjoy a great degree of freedom. There would be no use, indeed, in concealing their brown and haggard countenances, which operate rather as antidotes than incitements to guilty passions. The women of some tribes ingrain black lines and figures on their cheeks and bosoms.^d The tents of the Arabs, covered with a coarse stuff, or with palm leaves, have preserved the form of an inverted boat, which, according to Sallust, was that of the *mapalia* of the Numidians.^e They call a cabin of this kind *shaima*, and a group of them forms a *duar*, or hamlet, which is in the form of a ring, with the Sheik's house in the centre, and is frequently surrounded with a thorn hedge, as a de-

fence against the lions which roar around them. The number of these Arabs in the empire of Morocco alone is sometimes estimated at 40,000. The Arabs as well as the Moors send caravans of pilgrims to Mecca. In Asia both these classes of people are comprehended under the name of Magrebi, or Mogrebbins, a term which signifies "people of the west."

The Berbers, who are totally distinct from the Arabs and the Moors, seem to be the indigenous race of northern Africa. They probably comprehend the remains of the ancient *Gatuli* to the west of Mount Atlas, and of the Libyans to the east.^f They form at present four distinct nations. 1. The Amazirgh, called by the Moors *Shilla*, or *Shulla*, in the mountains of Morocco. 2. The Kabyls, in the mountains of Algiers and Tunis. 3. The Tibbos, in the desert between Fezzan and Egypt; and, 4. The Tuariks in the great desert. The identity of the language spoken by these different tribes, which is perceived by a comparison of their vocabularies,^g is one of the most important discoveries made in ethnographic history. This language has not hitherto been found to show any analogy to that of the Barabras of Nubia, or of the Shillooks of Abyssinia, but it is not impossible that farther researches may discover a connection. The Berber language, which the Amazirgh call *Tamazeght*, and the Kabyls, *Showia*, seems to us to have quite an original character, though approaching to the Hebrew and the Phœnician. The Berbers have a complexion of mixed red and black, a tall and handsome form, and a spare habit of body.^h In religious fanaticism they surpass even the Moors. When an opportunity is presented they occasionally gratify their antipathies by shedding the blood of Jews and of Christians. The Shillahs, however, eat the flesh of the wild boar, and drink wine. The Maraboos, who are honoured as a sort of saints, exercise in many of the Kabyl villages a despotic authority. These hypocrites distribute amulets, and affect to work miracles. Two of the most eminent of these at present in Morocco are Sidi Hamet and Sidi Alarbi, and hardly any thing is done in that empire without consulting them. Though they are considered as endued with the gift of prophecy and of miracles, they are not distinguished in the least degree by personal austerity or self-denial. In their respective districts no tribute is paid but to them. With their revenues and the valuable offerings which they continually receive, they support an armed force, with which they are always surrounded, and maintain a liberal establishment of wives and concubines, without incurring the slightest abatement from the sanctity of their character. In other places, especially among the Shillahs, there are sheiks who rule the small tribes into which the nation is divided. Those who live in the high valleys of the Atlas are almost entirely independent. In Morocco some tribes have joined together under princes or hereditary kings, called *Amargar*, whose patriarchal authority extends no farther than to the punishment of theft and murder. They manufacture their own gunpowder. Their meals consist of brown bread, olives, and water. The poverty and dirtiness of their dress give them a most savage appearance. Yet the Berbers manifest, in the cultivation of their fertile fields, a laborious disposition

and a degree of intelligence which might be turned to good account. They furnish the indolent Moors with corn, olives, and all sorts of provisions. Their villages, some of which may, for size and population, be called towns, are fortified with watch-towers, from which they can spy the approach of an enemy. On the slightest signal all the men are in arms. They handle the musket with much skill, tossing it in the air, catching it again, and discharging it with astonishing accuracy and rapidity.

Besides these genuine African nations, the northern part of this continent contains some foreign colonists, among whom are the Turks, the masters of Algiers, and once of Tunis and Tripoli,^a and the Jews, who are spread over the whole of Barbary, even among the valleys of the Kabyls.

This country, though one of the most salubrious, and the most propitious to the multiplication of the human race, is, in consequence of the absence of a regular government, exposed to calamitous visitations, and particularly to the ravages of the plague. Mr. Jackson, British consul at Mogadore, has drawn a horrible picture of a plague, which, some years ago, depopulated the empire of Morocco. The deaths in the city of Morocco amounted to 50,000, those at Fez to 65,000, at Mogadore to 4500, and at Saffi to 5000. The survivors had not time to bury the dead with any regularity. The bodies were thrown into large trenches, which, when nearly full, were covered over with earth. The young, the healthy, and the vigorous,

were first attacked; then the women and children; and last of all, the lean, the exhausted, the valetudinary, and the aged. When the scourge disappeared, a total revolution was found to have taken place in the fortunes and situation of individuals. Some who had previously been mere labourers now found themselves in possession of large capitals, and purchased horses which they scarcely knew how to ride. Provisions were sold in great abundance and extremely cheap. Flocks, with their shepherds, wandered in the pastures without owners. Great temptations were thus presented to the Arab, the Berber, and the Moor, all equally prone to theft. But they were restrained by an apprehension for their lives: for the plague, (*el khere*), is believed by them to be a divine judgment in punishment of their crimes. It was, therefore, imperiously necessary to avoid being caught by the avenging angel in the very act, and rather to regulate their conduct so as to prepare themselves for paradise. The price of labour was soon out of all bounds; and as the number of persons capable of working was not sufficient to supply the demands of the rich who were able to pay them, the latter found themselves under the necessity of performing little domestic offices with their own hands. They ground corn and baked bread, and the simplicity of the golden age seemed to spring up in this recommencement of the organization of society. Many large estates which remained without owners were seized by the Arabs of the desert.^b

^a The governments of Algiers, Tunis, and Tripoli, profess to acknowledge the supremacy of the Porte, and to obey its firmans, but their obedience is in a great measure nominal. The army and all the

officers of government in Algiers are Turks, and the sovereign is elective by the soldiers. In Tunis and Tripoli the sovereignty is hereditary.—P.
^b Jackson's Account of the Empire of Morocco. London, 1809.

BOOK LXV.

THE BARBARY STATES, AND THE GREAT DESERT OF ZAHARA.

PART II.

Detailed Descriptions.

IN the preceding Book we have delineated the physical geography and ethnography of the whole Atlantic region. We must now take a view of the different states or kingdoms of Barbary, and the cities and towns included in these political divisions. We shall first turn our attention to the small states scattered over the desert which bounds Egypt on the west. Then passing the *Syrtes*, we shall follow the chain of Mount Atlas, giving an account of the States of Tripoli, Tunis, Algiers, and Morocco, and conclude with a description of the Great Desert of Zahara.

The country of Barca is the first that comes in our way on leaving Egypt. Some call Barca a *desert*, and the interior certainly merits that name; others call it a *kingdom*, an appellation founded on the existence of this country as the independent kingdom of *Cyrenaica*, governed by a branch of the Ptolemies. The coast of Barca, once famed for its triple harvests,^a is now very ill cultivated; the wandering tribes of the desert allow no rest to the inhabitants, or security to their labours. The sovereignty of it is divided between two Beys, one of whom resides at Derne, a town surrounded with gardens, and watered by refreshing rivulets: his subjects may amount to 30,000 tents or families. The other lives at Bengazi,^b a town of 10,000 houses,^c with a tolerable harbour, on a coast abounding with fish, and in a fertile territory, from which wool is exported. The Bey of Tripoli appoints these two governors, whose obedience to his authority is often ambiguous.^d Among the magnificent ruins of *Cyrene*, the limpid spring still flows from which the city had its name. A tribe of Arabs pitches its tents amidst its sadly mutilated statues, and falling colonades. Tolometa, or the ancient *Ptolemais*, the port of Barca, preserves its ancient walls, a temple, and some inscriptions. This coast seems to hold out an invitation to European colonies; it seems to be the property of no government or people. A colony established here would rediscover those beautiful places which the ancients surnamed the Hills of the Graces, and the Gardens of the Hesperides. Such, however, is the latent rivalry of the civilized world, in matters connected with power and vanity, and the phantoms attached to the ideas of national greatness, and even national existence, that the most beneficent efforts of any people are liable to be resisted by the jealousy of another of equal pretensions.

The travels of the intrepid Hornemann have procured

for us a little information respecting the countries situated to the south of Barca. A chain of mountains runs west from the Natron Lakes as we leave Egypt, and taking successively the names of Mokarrah and Guerdoba, extends to the oâsis of Audjelah. These mountains are calcareous, naked, and precipitous. At their feet we pass over a flat marshy country, from one to six miles broad, and abounding in springs. Following these mountains westward, we first arrive at the oâsis of Siwah, which forms a small independent state. The inhabitants speak the Tibbo dialect of the Berber language. This is the country of Ammon of the ancients. The ruins of Ummibida seem to belong to a fortified caravansera, connected with the temple of Jupiter Ammon. They contain some hieroglyphics in relief. Their materials consist of a limestone brought from the adjoining mountains, containing petrified shells and marine animals. Diodorus speaks of the temple situated in the fort as distinct from that of the forest near the fountain of the sun.^e The arable territory of the oâsis of Siwah is about six miles long and four broad. The chief plantations consist of date trees; there are also pomegranates, fig trees, olives, apricots, and bananas. A considerable quantity of a reddish grained rice is cultivated here, being a different variety from that which is grown in the Egyptian Delta. It also produces a sufficient quantity of wheat for the consumption of the inhabitants. Abundance of water, both fresh and salt, is found. The fresh water springs are mostly warm, and are accused of giving rise to dangerous fevers, when used by strangers.^f The population of Siwah is capable of furnishing about 1500 armed men. This country is the Santariah of Abulfeda, and the Sant-Ryah of Edrisi. According to Ebn-Ayas, an Arabian author, the zebra is met with in the adjoining deserts.^g

From Siwah to Audjelah the mountains rise perpendicularly from the midst of the plain. The naked rock is not covered with a particle of soil, or even with sand. A sandy plain at the foot of the mountains, presents on its surface an immense horizontal calcareous bed, which contains no traces of petrification, while the adjacent mountains, also calcareous, are full of the remains of marine animals and shells. These are also met with here in large isolated heaps.

The oâsis of Audjelah, the Augila of Herodotus, contains three towns or villages, and is the residence of a bey, who is dependent on the bey of Tripoli. The town of

Audjelah is only a mile in circumference, and contains only narrow and dirty streets of mean houses built of limestone. The public buildings have a most wretched aspect. At Audjelah is the termination of the long chain of mountains which bounds the desert of Barca on the south, and separates it from that of Libya, running west in a direction towards Fezzan. A little beyond this we find another chain called Marai, of the extent and direction of which we know but little, only that it appears to send off ramifications to the north. Then we find the singular mountainous desert called Haroodjeh,^a which is probably the *Mons Ater* of Pliny. It commences at two or three days' journey from Audjelah, reaches to the mountains by which Fezzan is bounded, and is prolonged to the north of Fezzan; but the branches which it forms in this direction, and those also to the south, are less known. Haroodjeh presents a mass of broken mountains mostly bare and sterile, composed of black basalt. Their appearance is volcanic and exceedingly wild. In several places the ranges of basalt alternate with others of limestone. The low calcareous hills bounding the plains are composed of petrifications, which consist mostly of the heads of fishes.

It is probably in Haroodjeh that the solution will one day be found of the enigma of the Arabian geographers, respecting a town, which they call Raz Sem, the inhabitants of which were turned into stone. Shaw and Bruce did not penetrate so far as to procure information deserving of reliance. The tradition has the appearance of concealing under it a curious fact, the existence of mummies in some *Necropolis*, or city of the dead, like those of Egypt.

From Haroodjeh we enter Fezzan. Major Rennel and the learned Larcher consider Fezzan as the ancient country of the *Garamantes*; a point still, however, very doubtful, as we have shown in our History of Geography.^b

Fezzan is bounded by the state of Tripoli on the north, by the desert of Barca on the east, and by the great desert of Zahara on the west and south. The greatest length of the cultivated country, from north to south, is about 255 miles, and its greatest breadth 200 miles from east to west; but the mountainous region of Haroodjeh is comprehended in its territory. According to Hornemann, this small state contains 100 towns and villages, of which Moorzook^c is the capital. Sakna, Wadan, and Germah, are the names of others, the last of which resembles the ancient *Garama*. There is also Zoolah,^d which according to old travellers, contained magnificent ruins, but none such were seen by Hornemann. During the south wind the heat here is scarcely supportable even to the inhabitants, who then sprinkle their rooms over with water, in order to be able to breathe. The winter is not so mild as might be expected, owing to a cold and piercing north wind, which completely chilled the inhabitants while Hornemann was there, and obliged this traveller himself, though inured to a cold climate, to draw near a fire.^e Rains here are infrequent and scanty. Hurricanes sometimes blow from the north, darkening the atmosphere with clouds of dust and sand.

In the whole country there is no river or stream worthy of notice. The soil is a deep sand covering calcareous

rocks or earth, and sometimes beds of clay. There are numerous springs, which supply water for the purpose of agriculture. The whole of Fezzan, indeed, abounds in water, at a moderate depth under ground, derived, no doubt from the rains which fall on hills more or less distant, perhaps on the confines of the desert, and though absorbed by the sand, find their level among the loose strata, across a broad extent of desert, till they become accessible in Fezzan, and impart to this country its characteristic fertility. Dates are the natural produce and the staple commodity of Fezzan. Figs, pomegranates, and lemons, also succeed. A great quantity of maize and barley is cultivated; but the inhabitants do not raise corn sufficient for their own consumption, and receive a great part of what they use from the Arabs. Some ascribe this to their indolence; but remarks of that kind are often gratuitous conclusions, arising from a deficient comprehension of the principles of wealth and commerce. If the inhabitants are indolent, how do they contrive to procure an equivalent to give to these Arabs for their wheat? The latter may feed them because they are rich, but not simply because they are unwilling to work. Such facts, if they authorize any inference on the subject, would rather incline us to think that the industry of the people was such as to produce a population greater than the food produced in the country is able to maintain, or that a produce of a more delicate kind was given by them to the importing Arabs, in exchange for an article which goes farther for the purposes of nutriment. Fezzan abounds in pulse and culinary vegetables. The most common domestic animal is the goat. Sheep are reared in the southern parts. The ass is their beast of burden and draught. Camels are extremely scarce and high priced. All these animals are fed on dates or date-stones. In the province of Mendrah, natron floats in large masses on the surfaces of several lakes, over which a dense fog is frequently seen to hover.

The Fezzanese send caravans to Tripoli, Tombuctoo, and Bornoo. They trade in gold dust and black slaves. They are acquainted with the cowrie shell, or *cypræa moneta*, a circumstance which shows that their commercial relations extend to the coast of Guinea.^f From October to February, Moorzook is the great mart and rendezvous of the different caravans which come from Cairo, Bengazi, Tripoli, Gadames, Tooat,^g and Soodan.

According to some, the sultan of this country is tributary to the Bey of Tripoli;^h according to others, he only sends him a present.ⁱ According to Hornemann his revenues arise from his landed estates; others mention three or four moderate taxes. The population of Fezzan is estimated by Hornemann at 60,000 or 70,000 souls. The variety of their complexion shows that they are a mixed people. The indigenous race is of ordinary stature, of little vigour, with brown complexions, black short hair, a form of countenance which in Europe would be called regular, and a nose less flattened than that of the negro. The women, as in the whole of Africa, are immoderately fond of dancing. According to Hornemann, all the inhabitants are Mahometans; according to others, there are also some pagans among them, who live in a good understanding with the Mussulmans.^k The Fezzanese intoxi-

cate themselves with the juice of the date-tree ; in other respects they are very abstemious, which is partly the result of necessity. Hornemann says, that a person who can afford to eat bread and meat daily is esteemed a man of wealth. The houses of Fezzan are built of sun-dried bricks, made of calcareous and argillaceous earth. They are extremely low, and lighted only by the door. In this country young persons are often mutilated and transformed into eunuchs.

The Tibbos,^a a Berber nation, occupy the almost desert countries to the south-east of Fezzan, and from these extend eastward along the southern boundary of Haroodjeh, and the desert of Audjelah, as far as the vast sandy desert of Levata, by which Egypt is hemmed in on the west. This desert is the eastern limit of the Tibbos. The space on the south, lying between the Tibbos and the kingdom of Bornoo, is in the possession of the wandering Arabs, some of whose tribes live in caverns or grottos during the intense heats. Berdoa, an oäsis mentioned by Leo, is perhaps identical with the capital of the Boorgon Tibbos.

The state of TRIPOLI, properly so called, extends on the north of Fezzan between the great and the little *Syrtes* ; that is, between the Gulf of Sidra and that of Gabes.

Here the climate is extremely unpleasant ; the heat of the day and the coldness of the night being equally insupportable. From the month of May till the end of October no rain falls. Vegetation is more abundant in winter than in summer. The soil is tolerably fertile, producing dates, oranges, citrons, figs, almonds, and many other fruits. In winter there is abundance of all sorts of pulse, cabbages, turnips, and onions : in summer cucumbers and melons. Two days' journey south from Tripoli there is on Mount Garean a great plantation of saffron. Lions and panthers are rarely seen : jackals and hedge-hogs are numerous. Much inconvenience is created by serpents and scorpions.^b

The comparative geography of the towns is involved in an obscurity which it is not in our power to dissipate. There were three conspicuous towns in the Syrtic region ; and in the fifth century this region received the name of Tripoli, which means "the country of the three cities ;" but, to determine what these towns were, and what modern localities correspond to them, would require a long and not very amusing discussion. It seems to be certain, that at the time of the first invasions of the Arabians, the city of Sabrata, apparently as the capital of the province, had in common language received the name of Tripolis. It is still called Sabart, and "Old Tripoli." Its inhabitants took refuge in the place now called New Tripoli. This city may have been called Neapolis by the Byzantine authors, but it was certainly different from that which Pliny and the rest of the ancients designated under that name. Was it identical with Ocea ? This has been denied without decisive evidence. It is at least an ancient city, for it has a triumphal arch, dedicated, as appears by the remains of the inscription, to Marcus Aurelius Antoninus, surnamed the philosopher, and to his imperial col-

league, Lucius Verus.^c After being taken from the Arabs by Roger of Sicily, and occupied by the troops of Charles V. and by the Knights of Malta, it always returned into the hands of the Mussulmans ; but industry and trade have been much injured by these revolutions. Some stuffs are manufactured here. The harbour opens in a semicircular form, and is feebly protected by old fortifications.

To the east of the capital is Lebida, the ancient *Leptis magna*, with the remains of a temple, a triumphal arch, and an aqueduct ;^d also Mesurate, or Mezrata, the residence of a Bey. To the west we find Arzori, of sufficient importance in the fifth century to give its name to the province which was called *Arzugum Regio* ; and the island of the Lotophagi, now called *Zerbi*. The small towns on the borders of the two *Syrtes*, obscure in modern, as they were in ancient geography, seem to disappear as rapidly as the shifting sand hills by which they are surrounded. The populous villages of Mount Garean are partly composed of grottos cut in the rocks. The tombs are sometimes over the dwellings of the living.^e

The State of Tripoli, possessing an extensive territory, but depopulated, full of barren districts, and a prey to anarchy, is the weakest of the Barbary States. The hereditary prince, or pasha, who reigns here, does not annex to his name the title of *Dey*, but only that of Bey. He is more dependent on the Sublime Porte than the princes of Tunis and Algiers. He does not maintain regular troops, and his navy consists of some xebecs and armed polacres. The Danish frigate the *Naiad*, of 40 guns, commanded by Captain Sten-Bille, was perfidiously inveigled into the harbour of Tripoli, where it was attacked by the whole Tripolitan navy. The frigate drove off all the xebecs and polacres, and made the pasha tremble in his palace, so that he offered more moderate conditions than he usually exacts.

Tripoli exports the wool of Barca, gold dust, ostrich feathers, and slaves brought from the interior of Africa, senna, wax, and morocco leather. Caravans regularly arrive here from Fezzan, Morocco, and Tombuctoo.

To the west of Tripoli is the kingdom of TUNIS, the ancient *Africa Propria*, and the seat of the Carthaginian power. In the middle age, the State of Tripoli was subject to Tunis, of which Barbarossa took possession in 1533. At the present day, the Tunisians, more civilized than the Algerines, are their inferiors in power, and have some difficulty to support their independence. The State contains four or five millions of inhabitants. The Moors, who are the agriculturists and merchants, are less numerous than the nomade Arabs. The Turkish and Mameluke soldiery are comprehended under the designation of *hanefi*, and are now deprived of all influence. The princes, who are hereditary, are descended from a Greek renegado, and a Genoese female slave, but they are surrounded by Moors. The sovereign is called Kamouda Bey, a person of extraordinary vigour of character, and has now reigned nearly thirty years, without any attempt having been made to shake his authority. He is not the legitimate heir, yet lives on terms of intimacy with his cousins, who ought to

have inherited the throne. He superintends all the departments of government, and extends the protection of the law to Christians and Jews. The regular army does not amount to 20,000 men, and the navy consists of a few vessels armed for cruising. Addicted to agriculture, and other branches of industry, the Tunisians are less given to piracy than the other people of Barbary. The State revenues may amount to a million sterling.^a

The heat becomes insupportable in July and August, when the south wind brings the heated air from the interior of Africa. Some branches of the Atlas contain elevated and temperate regions. A fertile plain lies along the river Mejerda, the *Bagradas* of the ancients. Among its minerals are found alabaster, crystal, clay, plumbago, iron, and lead. The cattle are small and delicate. The horses are a degenerate breed. The sheep of Zahara, which are bred here, are as large as deer. Here are lions, panthers, hyænas, jackals, and other ferocious animals.

The southern part is sandy, rather level, barren, and dried up by the solar heat. It contains a large shallow lake called Loodeah,^{b c} which is the *Palus Tritonis* of the ancients. The country along the sea shore is rich in olives, and contains many towns and populous villages. But the western part is full of mountains and hills, watered by numerous rivulets, with highly fertile banks, yielding the finest and most abundant crops. Even the Mejerda is not navigable in summer. The generality of the soil is impregnated with sea salt and nitre, and salt springs are more plenty than fresh ones.

The city of Tunis is one of the first in Africa. It has a harbour, with good fortifications. The only fresh water to be had is rain water. This city has manufactures of velvets, silks, cloths, and red caps, which are worn by the people. The chief exports consist of woollen stuffs, red caps, gold dust, lead, oil, and morocco leather. The most active part of the trade is carried on with France. In no part of Barbary are the Moors so tolerant and so courteous as here. The commercial spirit of ancient Carthage seems to hover over this locality, so long the focus of African civilization and power. The ruins of that ancient city are to the north-west of Tunis. Her harbours, once the asylum of so many formidable fleets, seem partly filled up by alluvial depositions. In the south-east part are seen some remains of the moles by which they were bounded.^d A noble aqueduct is still to be seen, a monument of Roman power, under which the second Carthage flourished. The emperor Charles V. caused a drawing to be made of it, and the design was arranged by the celebrated Titian, to serve as a model for some tapestry to be executed for the Austrian court.^e

Among the modern places we may mention Barda, the Tunisian Versailles, being the palace in which the Bey resides. The Goletta, a well appointed fortress, commands the roadstead of Tunis, and the entrance of a large lagoon, which is scarcely navigable for boats. Biserta, a fortified town, is situated on a lagoon, which is exceedingly well stocked with fish, and might be formed into a magnificent harbour.

Porto-Farina, situated to the north-west on the Medi-

terranean, has an excellent harbour, which has become foul with rubbish. The ancient Utica, where the younger Cato died a voluntary death, was near this place. Soosa,^f a trading town, built on a rock, has a castle, and a good harbour on the Mediterranean. Hamamet, Sfakes, and Gabes, have also harbours or roadsteads. In the interior we notice Kairoan,^g a city founded by the Arabians, and for some centuries the capital of Africa. The Mussulmans boast of its principal mosque, supported, as they say, by 500 granite columns. Toser, on Lake Loodeah, is a great mart for wool.

The Bey of Tunis has sometimes disputed with the Bey of Tripoli the sovereignty of the small state of Gadames, which is at a distance in the interior, to the south of the lesser Syrtis. Gadames had once a flourishing trade, which has declined since the caravans, in going from Tripoli to Tombuctoo, have stopped at Agadez, instead of this place. All the caravans from the interior bring slaves, ostrich feathers, ivory, amber, senna leaves, and gold dust. Gadames is called by a modern author Gdamsia.^h

Proceeding westward, we enter the state of ALGIERS. This kingdom, watered by the Shellif and the Wadi-Jiddi, is crossed in its southern part by the chains of the Atlas, called Lowat and Ammer. We have described these chains, and mentioned the mountain of Jurjura, one of the highest in Barbary. This chain is about twenty-two milesⁱ long from north-east to south-west: the chains of Wannoojah and of Aures form the continuation of it to the east. Full of rocks and precipices, they are covered with snow for more than nine months, perhaps the whole year.

According to M. Desfontaines,^k the territory of Algiers, with the exception of the parts bordering on the desert, is less sandy and more fertile than that of Tunis. He found the climate more temperate, the mountains higher and more numerous, the rains more abundant, the springs and streams more frequent, the vegetation more active and more diversified. The mountains arrest the clouds that come from the north, and condense them by means of the snows which cover their summits, so that they fall down in rain. There are many salt rivers and springs, and near the lake called Marks there is a mountain of rock salt. Several mineral springs are known. Earthquakes are frequent, but not disastrous. There is a sandy plain which the Moors call Shott or Shatt, which is sometimes inundated, and receives five small rivers.

According to Mr. Shaw, the boundary of this state, with that of Morocco, is Mount Trara, which lies north and south, forming with its northern extremity Cape Hone, called by the inhabitants Hunein or Mellack: others extend it to the little river of Mulloia or Malva. It is a matter of little moment, as the country which lies between these two states is the desert of Angara, a sandy country, which appears to be still, as in the time of Leo Africanus, the abode of lions, ostriches, and predatory Arabs, who plunder every defenceless traveller. On the south the state of Algiers scarcely extends farther than the river Wadi-Jiddi. It is divided into four provinces, Mascara in the west; the province of Algiers; Titeri, to the south of

...

it;^a and Constantina, which is the most easterly, and continuous with Tunis.

The country of Zab, in the south, inhabited by nomadic Arabs or Berbers, yields a very doubtful obedience to the authority of Algiers, the southern limits of which are uncertain, and lost in the desert.

The city of Algiers, which contains a population of 80,000 souls, rises in the form of an amphitheatre at the extremity of a fortified anchoring ground, which, however, is not safe in a north wind. The numerous and handsome country seats scattered over an amphitheatre of hills, among groves of olive, citron, and banana trees, present a rural and peaceful landscape, very dissimilar in character to a nation of pirates.^b In the province of Algiers the city of Shersel, the ancient Cesarea, exhibits its ruins at the foot of a mountain covered with orchards. On the coast of the province of Mascara, we find Mostagan, a large town; Arseoo, a port from which grain is exported; and Oran, a fortress long occupied by the Spaniards, who restored it to the Algerines, reserving to themselves the fort of Mars-al-kibir, so situated as to command a large and good anchorage. Telemesen is the chief city of the interior, although the governing bey has established his residence at Mascara, a fortified place. At Telemesen there are some woollen manufactures. Among the nomade tribes of this province, the Beni-Ammer had in a great measure adopted the language and manners of the Spaniards of Oran. In the province of Titeri is the town of Bleeda, occupying a cheerful situation. It also contains some independent tribes. The province of Constantina, governed by a very powerful bey, almost forms an independent state. On the coast we have the town of Boogia,^c with a good harbour, where the mountaineers sell ship timber, figs, and oil; Coolloo,^d which exports cow-hides; Bona, in a country so rich in olives, lemons, jujubes, figs, and other fruit, that they are suffered to rot on the trees; and, lastly, La Calle, lately the station of a French commercial company, the chief object of which was the coral fishery. The interior contains the towns of Tubnah, Messila, Medrashem, with the tomb of Syphax. There is also Tifseh, a place fortified to cover the frontier on the side of Tunis, and the capital Constantina, containing nearly 100,000 souls, and adorned with many fine remains of Roman architecture. A short way from this city, the petrifying springs, called the enchanted baths, form small pyramids by the deposition of calcareous earth with which their waters are impregnated. The Cocos and Beni-Abbes, in the vicinity of Boogia, and the Henneishas, on the Tunisian frontier, and on the banks of the Mejerda, are powerful tribes of Kabyls, who yield to the Bey of Constantina an obedience equally precarious with that which he yields to the Dey of Algiers. In the mountains of Aures, the romantic traveller, Mr. Bruce, says he met with a tribe distinguished by a white complexion and red hair, whom he believed to be a remnant of the Vandals.^e They mark their foreheads with a Greek cross.

The country of Zab, watered by the river El-Djiddid,^f which loses itself in a marsh, supports with much difficulty its inhabitants, who are called Biscaris. It is a desert, containing some scattered groves of date trees. The coun-

tries of Wadreag and Guargala in the south, and of Sobair and Tegorarin in the west, seem to belong to independent Berbers.

In Algiers there are about 14, or 16,000 Turks. The remainder of the population consists of Coloris, or Kulogloos, Jews, Moors, Kabyls or Berbers, Arabian shepherds, negro slaves, and Christians, part of whom, till lately, were in a state of slavery, part free. The Coloris, or Kulogloos, are the posterity of Turks, by Moorish and negro women. They hold a middle rank between the Moors and Turks. They occupy some offices, but not the highest; many of them are very rich. They differ little from the Turks in figure, and a mutual jealousy subsists between these two classes. The government is both despotic and aristocratic. The army which is composed of Turks, chooses the Dey, or Sovereign, whose arbitrary power seems to be mitigated by the principal officers composing the Divan, the members of which are chosen from the oldest warriors. The army consists of about 6500 Turks; but during war, and when the Coloris are armed, the city of Algiers can send 16,000 men into the field. The revenues raised in the three provinces, from taxes on the Jews and Christians of Algiers, from the government monopoly of grain, the sale and ransom of prisoners, and confiscations, amount to a million and nine thousand Algerine piastres. The sciences and arts here are in a most deplorable state. The Algerines are even indifferently skilled in ship-building, and their compass is only marked with eight points. The chase is with them an important occupation. In autumn, and in winter, fifty or sixty persons join together to hunt the lion, the leopard, and other ferocious animals.

The empire of Morocco is a remnant of the great African monarchies, founded by the Arabs. The dynasty of the Aglabites, whose capital at one time was Kairooan, and more lately Tunis, and that of the Edrisites, which resided at Fez, were subjugated by the Fatimites, who afterwards being occupied with the conquest of Egypt, allowed their western possessions to be usurped by the Zeirites, who were succeeded by the Hamadians and the Abuhafsians in the provinces of Tunis and Constantina. But in the western extremity, a prince^g of the Lemtunaas, a tribe belonging to the Great Desert, at present unknown, chose for the reformer of his people, their legislator and high priest, Abdallah-Ben-Iasin, an extraordinary person, who lived on water, game, and fish, but who married and divorced many women every month. This artful fanatic created a sect marked in the first instance by furious zeal, and always extremely ambitious and enterprising, called the Almoravides, or more properly Morabeth. It issued from the desert like a fiery hurricane, threatening by turns Africa and Europe. The chief of these conquering zealots took the title of *Emir-al-Mumenim*, or Prince of the Faithful. In 1052, Abutasfin built the city of Morocco, or Merakash. Joosooph^h invaded and subjugated the finest part of Spain. At the same time the religious and political rule of the Morabeths extended over Algiers, the Great Desert, Tombuctoo, and other towns of Soodan; but new sectaries of a more austere character, the Mooa-

^a Titeri includes Algiers, the state or kingdom being divided into only three provinces.—*Ed. Encyc.*

hedes or Almohads,^a that is, the Unitarians, conquered in 1146 the great empire of Mogreb, or the west. Though less fortunate in Spain, they extended their power in Africa as far as Tripoli. Their princes took the title of Emir-al-Mumenim, and even that of Caliph. After the lapse of a century, intestine discords laid the Almohads open to the successful attacks of several rivals, among whom were the Merinites, who took possession of the kingdoms of Fez and Morocco. This dynasty more bent on retaining than on extending its possessions, made no effort to re-establish the great empire of Mogreb. In 1547, a Sherif, or descendant of Mahomet, put a period to the power of the Merinites. His posterity still reigns, after having weathered frequent revolutions. The sovereigns of Morocco conjoin the title of Sherif with that of Sultan.

The State of which we have now traced the origin, still embraces a territory of 500 or 550 miles^b in length, and 420° in breadth, almost as large as Spain, even when we confine ourselves to the cultivated parts of the provinces of Segelmessa,^d Tafilet, and Darah, situated to the S. and E. of Mount Atlas. All travellers join in praising the fertility of the kingdoms of Fez and Morocco, the one of which is situated to the north and the other to the west of the Atlas. This fertility, however, seems to be confined to those parts in which sufficient supplies of water cooperate with the goodness of the soil, and the heat of the climate. Though the inhabitants almost entirely neglect cultivation, fruit and grain are produced, not only in quantities sufficient for the wants of the people, but also for exportation. Morocco supplies a part of Spain with these necessaries of life. The principal grain is wheat. Barley is also abundant. It comes into ear in the month of March. Oats grow spontaneously. The olive in its best state, the citron, the orange, and the cotton tree, cover the hills. In the sandy plains, the Moors, by dint of irrigation, rear a variety of pulse, melons, and cucumbers. Many varieties of the vine succeed in the northern provinces. The forests are full of oaks with sweet acorns, cork trees, cedars, arbutuses and gum trees. The minerals are neglected; copper, tin, and antimony, are found; but they are only worked superficially.^e The climate, excepting for three months in summer, is very pleasant, but the dreadful hot wind of the desert prevails for fifteen days, or three weeks before the rainy season, which commences in September. During this season the rains are not constant. Much snow falls in the valleys of Mount Atlas.

The rivers are shallow, and generally have a bar at their mouth which prevents the entrance of large vessels. The largest rivers are the Mullaia which flows into the Mediterranean; the Subu, the Morbeia, or Ommirabee, and the Tensif, which fall into the Atlantic.

Without bewildering ourselves in the labyrinth of the topography of the provinces, we shall take notice of the principal cities. Fez, the capital of the kingdom of that name, is conspicuous among the African cities for its ancient literary renown. The passion for study, however, is now nearly extinct. It has preserved some manufactures of silk, wool, and red morocco; it has an active trade, and is said to contain a population of 30, or according to others 70,000 souls. Mequinez, in the plain to the west of Fez,

has, on account of its salubrious climate, been frequently selected as a place of residence for the Sultan. On the coast of the Mediterranean, the fortresses of Melilla, of Pennon-de-Velez, and of Ceuta, possessions of little use to Spain, are memorials of the attempts which the Christians have made to invade, in their turn, the territories of Islamism. In Tetuan, a town of 20,000 souls, the houses are generally two stories high, and good, but the streets are extremely narrow and gloomy. Their mode of building is to make a large wooden case for the wall, or for a part of it, into which they put the mortar, and when it is dry the case is removed. The roofs are flat, and the women, who live in the higher apartments, walk along them in paying their mutual visits. The women are so handsome, and at the same time so susceptible, that Mussulman jealousy has been obliged to prohibit Europeans from settling in it.^f Tangier, or Tandja, a town pleasantly situated on the Straits, has become the residence of most of the European consuls. Passing Cape Spartel, we find on the shore of the Atlantic Ocean, the large town of Larash, or El-Araish, at the mouth of the river Luccos, which here forms a port: Mamora on the south side of a number of large lakes, and Saleh,^g formerly a sort of piratical republic, now a commercial town, the residence of the French consul, and separated by the river Buragrag from the town of Rabat, or New Saleh. At Azamore on the Morbeia, the kingdom of Fez ends, and that of Morocco begins.

The capital of this kingdom, and the ordinary residence of the Sultan, is properly called Merakash. It contains, according to the best authorities, from 20, to 30,000 inhabitants, silk, paper, and red morocco manufactures, an extensive palace with some of its rooms richly furnished, large magazines of grain, built under the direction of a Danish architect,^h and numerous mosques, one of which had minarets, surmounted with four golden globes, which were said to be enchanted, but which a Sherif had courage enough to order to be removed.ⁱ On the coast we find Mazagan, a Portuguese fortress, which was unsuccessfully besieged by 200,000 Moors.—Valadia, the best situation for a harbour on this coast, where rapid currents and violent squalls render a place of shelter a most valuable object to the seaman:—Safi, or Asafi, a small town at the foot of Mount Atlas:—Mogadore, the great emporium of the whole empire, regularly built, on plans given by a French engineer, well fortified, and provided with a harbour, which, however, like all the rest on this coast, is filling with sand.—Next comes Agadir; and lastly, Santa Cruz, the most southerly port of Morocco, situated in the province of Sus, the capital of which is Tarodant, a large inland town, and a military station for resisting the depredations of the nomades.

The cities of Tafilet, and Segelmessa, to the south-east of Mount Atlas, though now little known, were once very flourishing places. The caravans bound to Soodan and Egypt, seem still to join at these places, or both at least pass through them. According to Jackson, Tafilet possesses excellent woollen manufactures.

The writer just mentioned, who officiated as British consul at Mogadore, has given an opinion on the population of Morocco, very different from what is entertained by the

ⁱ Saint-Olon, quoted by Bruyzen La Martinière, under the article Maroc.

greater part of travellers, who represent this country as extremely depopulated, containing not more than five or six millions of inhabitants.^a This author says he has collected particular information on the subject; but he does not always mention the precise sources from which it is derived. He professes to have seen the imperial registers, in which the names of all taxable persons are inscribed; but he does not say how these registers are kept, and what evidence we have of their correctness. The following are the numbers which he assigns;

	Inhabitants
Cities and towns of the Empire	936,000
Kingdoms of Morocco and Fez, to the west of Mount Atlas	10,300,000
Nomade tribes to the north of the Atlas	3,000,000
Tafilet, a kingdom to the east of the Atlas	650,000

Total population of the Empire 14,886,000

As the whole surface of the Morocco states is 359,380 square miles,^b the population would average forty-two inhabitants to the square mile;^d but it consists of two very different countries; that which lies to the west and the north of the Atlas, and that which lies to the east and the south. As the latter, which gradually passes into the desert, would only contain 700,000 persons on a surface of 134,225 square miles,^e making five or six to each square mile,^f the maritime part, or the kingdoms of Fez and Morocco, would contain, on a surface of 201,544 square miles,^g more than fourteen millions of inhabitants, which would make the relative population amount to seventy per square mile;^h a proportion perhaps equal to what exists in Spain or Turkey, and which it is not easy to admit without further inquiring into a country so much exposed to intestine troubles, so ill governed, and so destitute of the means of civilization. Mr. Jackson makes the city of Morocco to contain 270,000 inhabitants, and Fez 380,000, assertions too extravagant to require discussion. Travellers of excellent character give the first of these cities no more than 30,000, and the other 70,000, and yet seem to think it possible that they exaggerate them.ⁱ

The subjects of this empire are slaves to an absolute despot, and strangers to the benefits of fixed laws, their only rule being the will of the emperor. Wherever this prince fixes his residence he distributes justice in person; for this purpose he generally holds a court twice, and sometimes four times in the week, in a hall of audience called *M'shoire*.^k Here all complaints are addressed to him; every person has access; the emperor hears each individual, foreigners or natives, man or woman, rich or poor. Distinctions of rank have no influence, every person being entitled, without hindrance or embarrassment, to approach the common sovereign. Sentence is promptly pronounced, always with absolute and ultimate decision, and for the most part with justice.

With the exception of these imperial audiences, the administration under this government is a tissue of disorder, rapine, and violence. The governors of provinces have the title of *kalif* or lieutenant, and that of *pasha*, or of *kaid*;^l and combine the executive with the judicial power. They only remit to the judges some complicated causes.

^h 523 to a sq. league.

In some of the towns, such as Fez, there are *kadis*, or independent judges, who are invested with great powers. Oppressed and harassed by the sovereign and the courtiers, all these governors and judges oppress the people in their turn. The lowest officer pillages legally in his master's name. The wealth thus acquired falls in the end into the coffers of the sultan, who, under some pretext or other, causes those who have amassed treasures to be dismissed from office, accused, and condemned. The sovereign can deprive a subject of every thing belonging to him except what is strictly necessary to save him from starvation. The confiscated sums are said to pass into the common treasure of the Mussulmans; this is all the account of them that is given. The consequences of such a system may be easily conceived. The people, suspicious, cruel, and perfidious, respect no sort of obligations. Their universal aim is to pillage one another; no confidence, no social tie exists among them, and scarcely even any momentary feelings of affection. The father dreads the son, and the son detests the father.

The different religions which maintain the unity of Goa are tolerated. There are Roman Catholic monasteries at Morocco, at Mogadore, at Mequinez, and Tangier; but the Romish monks at Morocco and at Mequinez are closely watched and exposed to vexations.^m The Jews, who are exceedingly numerous, and extend even among the valleys of the Atlas, are treated with the most revolting barbarity. Their situation, civil and moral, in this country, is a most singular phenomenon. On the one hand, their industry, their address, and their intelligence, make them masters of all the trade and manufactures. They direct the royal coinage; they levy the duties on exports and imports; and officiate as interpreters and men of business.ⁿ On the other hand, they experience the most odious vexations and the most dreadful usage. They are prohibited from writing in Arabic, or even learning the characters, because for them to read the Koran would be a profanation.^o Their women are prohibited from wearing any green article of clothing, and are only allowed to veil one half of the face. A Moor enters the Jewish synagogues without ceremony, and even abuses and insults the rabbins. In passing a mosque, the Jews must uncover their feet and take off their slippers at a respectful distance. They dare not be seen on horseback, or sit cross-legged before Moors of a certain rank. They are often assailed by the lowest blackguards in the public walks, who cover them over with mud, spit in their faces, or knock them down; they are obliged to ask pardon, and call the person *sidi*, or 'sir,' who, the moment before, most outrageously maltreated them.^p Should a Jew, under any provocation, raise his hand to strike a Moor, he runs the risk of being capitally condemned. When employed to work for the court, the Jews receive no pay, and think themselves happy, if they are not beaten. A certain prince *Ishem* ordered a dress from a Jewish tailor; the dress when it came did not exactly fit him; the prince proposed to kill the Jew on the spot; the governor of the city interceded for him, and he got off with having his beard pulled out hair by hair.^q At Tan-

gier, an order of government once appeared in the middle of winter, that every Jew should go bare-footed, under the penalty of being *hung up by the feet*. To crown all, they are frequently condemned in Morocco to be thrown, like Daniel, into a den of lions; but, as the keepers of the lions are themselves Jews, it is rarely that any deadly consequences ensue. The keepers use the precaution to feed the lions abundantly, and not to leave their countrymen exposed to them longer than a single night.^a

The Moors entertain the loftiest ideas of themselves and their country. These half-naked slaves style the Europeans *agein*, or barbarians. They are not altogether destitute of virtues. A Moor never abandons himself to despair; neither sufferings nor losses can extort from him a single murmur; to every event he submits as decreed by the will of God; and habitually hopes for better times. The Moors admit of no distinctions founded on birth; nothing except public office confers rank. Among the points of etiquette which prevail at the court of the princes of Morocco, a very singular one is quoted by the author whom we follow. The word *death* is never uttered in presence of the sultan. When it is unavoidable to mention to the sovereign the death of any person, it is expressed by such words as, "He has fulfilled his destiny," on which the monarch gravely remarks, "God be merciful to him." Another point of whimsical superstition is, that the numbers *five* and *fifteen* must not be mentioned in presence of the prince.^b

Mr. Hæst estimates the revenues at a million of piastres, the chief sources of which are the customs and the tithes. The sultan generally amasses treasure. The army, composed of 24,000 negroes and 12,000 Moors, is ignorant of discipline and manœuvring. The navy consists entirely of corsairs, which are sometimes fifty in number. It is only by the position of their country that these ignorant and cowardly seamen are enabled to inflict inconvenience on Europeans.

Raw produce is all that a country so far behind in civilization can export. The following is a list of its exports, according to the concurring accounts of travellers: wool, wax, (5000 quintals,) ox-hides, morocco leather, ivory, ostrich feathers, poultry, and eggs, (to the amount of two millions of francs, or 83,333*l.* by the ports of Larash and Tangier alone, according to Lempriere,) cattle for Portugal, mules for the West Indies, gum-arabic of indifferent quality, crude copper, almonds, argan oil,^c used in the manufacture of Marseilles soap; various fruits, and wheat when the exportation of it is allowed. The imports are cloths, hardware, Biscayan iron, spiceries, and tea; also ship-timber, which is not to be had on the coast, though probably it would be found on Mount Atlas if pains were taken to inquire for it. In 1804 the exports from the port of Mogadore did not exceed 128,000*l.* sterling, duties included, and the imports amounted to 150,000*l.* The most active part of the trade of the Moroccans seems to be that which they carry on with Tombuctoo, by means of a caravan which goes from Akka in the province of Darah.

Now that we have taken our survey of the whole of Bar-

bary, from the confines of Egypt to the shores of the Atlantic Ocean, the old routine of geographers should bring us to Biledulgerid; but there is in reality no such geographical division. The name of *Belad-el-Djerid*, or "the Land of Dates," falls under the same description with those of *Belad-el-Folfol*, "the Pepper Country," and *Belad-el-Tibr*, "the Land of Gold." Such appellations cannot apply to a country of definite limits. The Arabs gave the name of the "Land of Dates" to all the countries situated on the southern declivity of the Atlas, as far as the Great Desert. This stripe extends from the Atlantic Ocean to Egypt. It includes Darah, Tafilet, Segelmessa, Tegerarin, Zab, Guargala, the country of Totser, Gadames, Fezzan Audjelah, and Siwah.^d All these districts have been already mentioned in their proper places: the country of Totser, which belongs to Tunis, and to which Shaw and some others give the special name of *Belad-el-Djerid*, is properly the *Kastiliah* of the Arabian geographers.^e Other travellers, with no less impropriety, give the name of *Biledulgerid* to the province of Darah in the south part of Morocco.

The Great Desert, called in Arabic *Zahara*, extends in the ordinary acceptation of the term, from Egypt and Nubia to the Atlantic Ocean, and from the foot of Mount Atlas to the banks of the Niger. But, as Fezzan and Agadez, at least according to the latest notions, separate the deserts of Bilma and of Berdoa from the rest of the *Zahara*, we shall not at this place take them under our view. The great desert of the north-west of Africa seems to be a table-land little raised above the level of the sea, covered with moving sands, and here and there containing some rocky heights and some valleys where the water collects and nourishes some thorny shrubs, ferns, and grass.^f The mountains along the shore of the Atlantic Ocean are in no continued chain, but only in detached peaks. Towards the interior they lose themselves in a plain covered with white and sharp pebbles. The sand hills, being frequently moved by the wind, lie in undulating lines like the surface of an agitated sea. At Tegazza, and some other places, a sal-gem whiter than the purest marble, lies in extensive strata under a bed of rock.^g No other mineral substance belonging to this desert is mentioned by authors; but, on its southern margin, Golberry found masses of native iron, his confused description of which excites our curiosity without giving any satisfactory information. For a great part of the year the dry and heated air has the appearance of a reddish vapour, and the horizon looks like the fire of a series of volcanoes.^h The rain, which falls from July to October,ⁱ does not extend its precarious and momentary blessings to every district. An aromatic plant resembling thyme, the plant which bears the grains of *Zahara*, acacias, and other thorny shrubs, nettles, and brambles, constitute the ordinary vegetation of the desert. It is rarely that a grove of date trees, or other palms, is to be seen. The forests of gum trees, (the *Mimosa Senegal* of Linnæus) situated on the extreme border of the desert, seem to be detachments derived from the vegetation of Senegambia. Some monkeys, and some gazelles, support

themselves on this scanty vegetation. The ostrich also lives here in numerous flocks, feeding on lizards and snails, together with some coarse plants, such as *apocynums*.^a Lions, panthers, and serpents, sometimes of enormous dimensions, add to the horrors of these frightful solitudes. Ravens, and various other birds, dispute with the Moorish dogs the dead bodies of men and quadrupeds. These animals live here almost without drinking. The flocks consist of camels, goats, and sheep. The horses, which are very rare, sometimes receive milk to allay their thirst, for want of water.^b

The coast of Zahara contains some harbours and roadsteads. Those of Rio-do-Ouro, and of St. Cyprian, are formed by large creeks, resembling the mouth of rivers. The Gulf of Arguin, and the Portendik road, have often been visited by Europeans. On the same line of coast are Cape Bojador, the terror of the navigators of the middle age, and, down to 1433, the fatal limit of all sea voyages in this direction, and Cape Blanco, which, according to the most probable opinion, was the limit of the discoveries of the Carthaginians.

The people called Mooselmins, live to the north of Cape Bojador. Their territories are intermediate between Morocco and the desert. These people are composed of a mixture of the descendants of Arabs and fugitive Moors from Morocco. Their lands are not destitute of fertility, and the limits between them and the desert are indicated by a series of lofty pillars. Their life is intermediate between the pastoral and the agricultural state. Their corn is, in harvest, deposited in large holes dug in the sand, in which the different individuals have shares proportioned to the number of labourers whom they have employed. They remain by their fields in seed-time and harvest, but wander in all directions with their cattle during the rest of the year, taking with them only necessary articles, and returning to their stores from time to time for a supply. The more opulent among them, and the artizans, reside in towns. The former are proprietors of cattle, which are abroad in the country under the care of their slaves. Gratuitous hospitality is habitually practised in the country, but not in the towns. Their government is republican, and their chiefs elected annually. Their country is populous, though their numbers are in some measure kept down by frequent warfare with the emperor of Morocco. These people are better clothed and more prosperous than the Moroccans. They are almost continually on horseback. They excel in breaking and managing their horses, which are the best in the world, and are skilful riders. The Mongearts live between Cape Bojador and Cape Blanco. On the heights along this dangerous coast, they generally make signals to the ships at sea, in order to allure them to their inevitable ruin. These ferocious Africans instantly take possession both of the goods and crews. The Wadelims and the Labdessebas, who live near Cape Blanco, are described as monsters of cruelty, by a Frenchman who had the misfortune to suffer shipwreck on their coasts. The fate of the prisoners is truly lamentable. The Moors, in conveying them to the heart of the desert, make them walk, like themselves, fifty miles per day, giving them in the evening only a little barley meal, mixed with water, the common food of

these nomades. The soles of the feet in the European swell dreadfully from the heat of the burning sand, in which the Arab travels without inconvenience. The master soon perceives how ill qualified his slave is for the travels and toils of this sort of life, and therefore endeavours to get rid of him. After dragging him from one market to another, he generally meets with one of the Jewish travellers who are settled at Wadi-Noon, and cross the desert with their merchandize. The Jew purchases the prisoner for a little tobacco, salt, and clothes. He afterwards writes to the agent of the European nation to which the prisoner belongs, and endeavours to obtain for his liberty as high a ransom as he can.^c

The gum forests between Cape Blanco and the Senegal, are in the possession of three tribes, called Trarsas, Aulad-el-Hadgi, and Ebraquana. All the three are of Arabian origin, and speak their mother tongue: they are Mahometans, and live in camps, without any fixed houses.

The territory of the Trarsas^d is bounded on the west by the ocean, and on the south by the Senegal. Their capital, if we can be allowed to use the term, is in an oâsis, the name of which is believed to be Hoden. To this place they seem to retire during the rainy season; but they anxiously conceal the place of their retreat, which they call their country. We are only permitted to know that these oâses are situated between the 18th and the 22d degree of north latitude, and between the ocean and the 7th degree of longitude, (reckoning from the island of Ferro.)^e The territory of the Brachnas, or the Ebraquana, and of the Aulad-el-Hadgi, is bounded on the west by the Trarsas, on the south by the Senegal, on the east by Ludamar. On the north they have the same sort of boundaries as the rest.^f

Portendik, on the coast, is the port where the trade with the Trarsas is carried on. Podor, on the Senegal, is the resort of the more easterly tribes.

These Moors or Arabs, are in general a base and perfidious people, although individuals have been found among them distinguished for courage and other virtues. Cruel whenever they are possessed of power,—treacherous and faithless, they are strangers to every sentiment of generosity or humanity. Their wild aspect corresponds to their barbarous manners. Even in their copper complexion, containing a mixture of red and black, there seems to be something that indicates badness of character.

Golberry, who has drawn this picture, saw their women in a more agreeable light, at least during youth. According to him, they are handsome at that happy age; their features are fine, mild, and regular; their colour inclines to a pale yellow, but fairer and clearer than that of the men. They live in tents; men, women, children, horses, camels, and other animals, being crowded promiscuously under the same cover. The camps, which they form on the banks of the river, are composed of the better sort of tribes. They live on millet, maize, dates, and gum; and their sobriety and abstemiousness are almost inconceivable. The greater part of their fruits are furnished by the oâses: the date-palms, above all, grow there in the greatest abundance. They have cattle with humps on the back, and

excellent horses, whose rapid pace equals the speed of the ostrich.

Our arts and trades are not altogether unknown to these barbarous people: they even practise some of them with skill. They have weavers who, with the simplest portable looms, make stuffs out of the hair of animals, especially the camel and the goat. They have even the secret of manufacturing morocco leather. They know how to apply to purposes of utility the skins of lions, leopards, panthers, and hippopotami. They reduce lamb's skins to the thinness of paper, then dye them with different colours, and fashion them into ornaments. They form stirrups and bridle-bits of single pieces of metal, as well as sabres and poniards; inrust and damaskene the handles of the latter, and adorn the scabbards with plates of gold and silver. They have their itinerant goldsmiths and jewellers, who make bracelets, chains, gold-rings, filligrees, and arabesque ornaments, by which they compose, with no small skill and taste, pieces of ornamental dress for ladies and royal personages.

Farther to the east, we know the tribes of the desert only by the Moroccan caravan, or *akkabah*, which travels every year to Tombuctoo. The *akkabahs* do not proceed in a straight line across the immense desert of Zahara, which offers no trace of a beaten road, but turn sometimes westward, sometimes eastward, according to the position of the different oases. These verdant lands, scattered over this vast desert, like islands in the ocean, serve as places of rest and refreshment to the men and animals. So violent is the burning wind, called the samoom or shoom,^a that the scorching heat often dries up the water contained in the leathern bottles which the camels carry for the use of the merchants and the drivers. There was a monument here which, in the time of Leo Africanus, attested the deplorable fate of a driver and a merchant, the one of whom sold his last cup of water to the other for ten drachms of gold. Both had perished. In 1805, an *akkabah* consisting of 2000 persons, and 1800 camels, not finding water at the usual resting-places, died of thirst, both men and animals. The vehemence of the burning wind, which in these vast plains raises and rolls before it the waves of reddish sand, makes the desert so much to resemble a stormy sea, that the Arabs have given it the name of "dry sea," (*Bahar billâ mâa.*)^b Possessing some knowledge of the positions of the stars, they use the polar star for direction, and so prefer travelling during the clear nights of these climates, rather than brave during the day the intense heats of a burning sun.

The *Akkabahs* of Morocco take about 130 days to cross the desert, including the time occupied in resting at the different oases, or places of refreshment. Leaving the city of Fez, and proceeding at a rate of three miles and a half per hour, they travel seven hours each day, and arrive in ten days at Wadi-Noon, Akka, or Tatta; there they stop a month for the arrival of the other caravans which are to join them; sixteen more days are then occupied in travelling from Akka to Tarassa, where they rest fifteen days. They then proceed to Arooan, another station at the distance of seven days' journey, where they also rest 15 days. They then set out for Tombuctoo, where they

arrive on the sixth day, after a journey of 129 days, being fifty-four of travelling, and seventy-five of rest.^c Another caravan which leaves Wadi-Noon and Sol-Assa, crosses the desert between the black mountains of Cape Bojador and Gualata, goes to the western Tarassa, (probably the country of the Trasarts,) where it stops to procure salt, and arrives at Tombuctoo after a journey of five or six months. This *akkabah* goes as far as Jibbel-el-Bud, or the white mountains near Cape Blanco, and crosses the desert of Magaffra, to the district of Agadir, where it rests twenty days. These caravans obtain an escort from each tribe through whose territories they pass. Thus, in crossing those of Woled-Abuseid, they are accompanied by a great number of soldiers, and two sebayers or chiefs of clans, who, after conducting them to the territory of Woled-Deleim, receive their remuneration, and commit the *akkabah* into the hands of the chiefs of this district: these escort them to the territory of the tribe of Magaffra, where other guides convoy them to Tombuctoo. Sometimes a caravan, bolder or more hurried than the rest, attempts to cross the desert without an escort; but they seldom fail to repent of their temerity, by falling into the hands of the two tribes of Dikna and Emjot, which inhabit the northern frontiers of the desert.

Being subject to a religious code which forbids the use of inebriating liquors, the merchants of the caravans know no other drink than water; dates and barley meal serve them for food during a journey of many weeks across the desert. Their clothing is equally simple. Fortified by this frugality, and sustained by the prospect of returning to their homes, they sing as they trudge along, to shorten the long hours of travel. When they come near any dwellings, or when their camels seem in danger of dropping down with fatigue, their songs acquire additional spirit and expression; their melody and sweetness restore animation to the toiling camels. At four in the evening they pitch their tents, and join in prayer; to this act of devotion supper succeeds; then they sit down in a ring, and converse or recite stories till their eyes are closed in sleep. The Arabic language becomes extremely agreeable in the mouths of the camel drivers; it is then equally soft, and more sonorous than the Italian; their particular dialect resembles the ancient language of the Alcoran, which for 1200 years has scarcely undergone any alteration. The Arabs of Magaffra, and those of Woled-Abusebah, compose extempore verses with great readiness; the women are good judges of poetry, and show particular favour for those young Arabs who excel in this literary exercise.

We do not know the precise situation of the deserts of Zuenziga and Targa, mentioned by Leo: they must be to the north of the oasis of Tuat. The Lemtuna^d of this writer seem to form part of the Tuariks of the moderns. Agadez, a large town inhabited by slave-merchants, and situated to the south of Tezzane, is also known by the name of Tuarik,^e probably as being the chief settlement of that people.

May not the great desert which we have now described be the dried basin of a sea? Diodorus speaks of a lake of the Hesperides, which was turned into dry land by an earthquake; perhaps the countries of Mount Atlas, once

^a "Samum or shume."

^b "Sea without water."

^c The sum given here does not correspond with the details. The

entire sum, derived from them, is only 99 or 100 days, of which only 39 of travelling.—P.

^d See p. 61, origin of the Almoravides.—P.

^e Abderrahman, Nouv. Mus. Allem. III. p. 988.

surrounded by a double Mediterranean, formed that celebrated Atlantic island^a which is sought for in every direction and nowhere found. On the borders of the great desert there are immense collections of the remains of marine animals. Soodan is destitute of salt, but the deserts of

^a Atlantis.

Zahara are covered with it. Pliny and Leo concur in saying, that in several districts, sal-gem was cut like marble or jasper, and used as stones for building houses. These facts seem favourable to the hypothesis now mentioned ; but the level of the desert is unknown ; and such theories do not, in the present state of retrospective geology, admit of any approximation to proof.

BOOK LXVI.

SENEGAMBIA AND GUINEA.

THE region which we are now to visit, affords a remarkable example, both of the beneficence of nature and of the perversity of the human mind. These countries, in which tyranny and ignorance have not had the power to destroy the inexhaustible fecundity of the soil, have, down to the present times, been the theatre of eternal robbery, and one vast market of human blood.

The sea-coasts of this region experience the most intense heat that is known in any part of the globe. The cause of this is to be found in the east winds which arrive on these coasts, after having swept over the burning surface of Africa in all its breadth.^a At Goree, in the years 1787 and 1788, in November and in May, the thermometer stood between 68° and $88\frac{1}{4}^{\circ}$: during the night it did not fall below 60° . From May till November it did not fall below 77° , nor rise above $99\frac{1}{2}^{\circ}$. Thus there are only two seasons; the one may be considered as a moderate summer, the other as a continuation of burning dog-days. But, during the whole year, the sun at mid-day is insupportable. At Senegal the heat is still more intense, amounting to 113° , and sometimes to 131° . The barometer almost always rises in those circumstances under which it falls in France, that is, at the commencement of a storm. The north and north-west winds blow almost without interruption. The east or trade winds are only felt at 90 or 120 miles from the coast. The south wind is very rare. During the great heats a dead calm prevails for about thirty days, which is enervating to the most robust constitutions. From the beginning of June till the middle of October sixteen or eighteen heavy rains fall, amounting to fifty or sixty inches of water. A single one sometimes gives as much as six or seven inches. During the rest of the year there are heavy dews.^b

Of all the countries of western Africa, the Gold Coast seems to be subjected to the most intense heats. Near the Rio Volta, Isert saw the thermometer of Fahrenheit rise to $95\frac{1}{2}^{\circ}$ within an apartment, while it was 134° in the open air, which surpasses by 26 degrees the greatest heat observed by Adanson on the banks of the Senegal.^c

In the Gulf of Guinea the prevailing winds are from the south-west, which makes it difficult for vessels which venture into it to get out. This direction of the wind, being contrary to the trade winds, is to be explained by the rarefaction of the air in the central countries of this part of

Africa, a circumstance from which some infer the absence of high mountains.^d

Between Cape Verga^e and Cape Palmas, the hurricanes, called tornadoes, from a Portuguese term for whirlwinds, are very frequent in summer and autumn; their approach is announced by a small white cloud, apparently five or six feet broad, remaining immoveably in one spot. This soon extends, and covers a great part of the horizon. An impetuous whirling wind now breaks forth, which lasts only about a quarter of an hour: but in this short space, enormous trees are torn up by the roots, houses are thrown down, entire villages destroyed, and vessels driven from their anchors and wrecked. This scourge is unknown on the Senegal, and even from Cape Blanco to Cape de Verga; but it sometimes occurs in the Zahara. The winds raise the impalpable sands, forming them into columns which rise to an immense height, and become a sort of sand spout. After different changes of form, they are either dissipated through the air, or carried along, sometimes to very great distances; sometimes they break through in the middle with a crash like the explosion of a mine.^f The harmattan, the name of which seems to be of European origin, (*air matant*)^g is an east wind which prevails chiefly in Benin, and extends to the Gold Coast; it brings on a dry haze; the horizon is darkened; the skins of animals and men become contracted and chopped. These harmattans are felt about the solstices.^h

Near the sources of the Senegal, the Joliba or Niger, the Gambia, and the Mesurado, there is a nucleus of mountains, from which, according to the most recent maps, branches go off like so many rays, which might lead us to suppose that they are granitic, or schistous mountains, yet the numerous falls in the rivers seem to indicate a surface rising by terraces, and hence probably calcareous. Some of them must be of great elevation, if the reports of the negroes to M. Mollien were correct, that to the south-east of Timbo, and the sources of the great river, some of the mountains "have a white hat."ⁱ

The mountains on the coast, from Cape de Verde to the Gambia, present indications of volcanoes, which, however, are equivocal, as the lavas of which they are said to be composed may be considered as basaltic rocks. The foot of Cape Sierra Leone is encircled with basaltic rocks, called by the English Carpenter's Rocks, and the whole coast has

the same general appearance. Immense alluvial tracts give to the coast of Senegambia some resemblance to Guiana. The islands to the south of the Gambia are partly inundated, and continually accumulating.

The rivers of this country are very numerous. The Senegal, long confounded with the Niger, rises in the country of Foota-Jallon,^a near Timbo, about 10° N. lat. and has a course, first to the north-east, then to the north-west, then west, more than 800 miles in all, before it reaches the ocean.^b Among the falls of this river, that of the Feloo rock merits most particular attention. For seven months in the year the rock stops the course of the water, but during the other five they rise high enough to flow over the top of the rock. At the mouth of the Senegal there is a bar which prevents the entrance of all vessels that draw more than ten feet of water, though immediately within the bar the river is thirty feet deep. La Barthe observes, that in 1779 the entrance of the bar was eleven miles from the island of St. Louis, though now it is fourteen.^c These variations are of great importance in determining the mooring grounds. They are owing to currents in opposite directions, which, in proportion to their relative strength, deposit the sand in a place from which they afterwards carry it away.^d Similar shiftings take place over the coast in general. The banks of the Senegal become highly picturesque when we ascend 140 miles^e from the sea. Lined with hills and mountains, where tall trees, mixed with handsome shrubs, form verdant arches and amphitheatres, this river would furnish one of the most interesting voyages in the world, were not its charms so essentially impaired by the unwholesomeness of the air, the hideous aspect of the crocodiles, and the bellowing of the hippopotamus. The merchants even avoid it, and prefer going by land.^f While the Senegal is only navigable in the rainy season, the Gambia cannot be navigated except in the dry season. Forty gun frigates can go up thirty-seven miles, and large merchant vessels 180.^g The rains give it an enormous increase of depth, but at the same time, such inordinate rapidity that no vessels can stem the current. This river, though exceedingly deep and wide, has only a course of 610 miles.^h The Rio Grande, no less remarkable both for depth and width at its mouth, which is encompassed with islands, has a course only half as long as that of the Gambia. The Rio Mesurado is remarked for its rapid and rectilinear course, but otherwise little known.ⁱ The rivers of the coast of Guinea seem to take their rise in the Kong mountains, at distances from 300 to 400 miles.^k The Rio Volta, which is the least known, descends in a series of cascades; but the deepest angle of the Gulf of Guinea receives the Formosa, the Calabar, and other broad and deep streams, which form at their termination a delta larger than that of Egypt. We shall afterwards state some reasons for considering these rivers as the mouths of the Niger.

^l Isert, Voyage à la Guinée, p. 110—231.

At the head of the trees of these regions stands that colossus of the vegetable kingdom, the immense baobab, the *Adansonia digitata* of Linnæus. Isert, a learned Dane, observed several species of this genus, though only one has been hitherto botanically determined.¹ Its fruit, surnamed monkey's bread, affords abundant aliment to the negroes, who, at sun-rise, watch religiously the opening of its flowers, which have been closed during the night. The whole of Senegambia and Guinea is adorned with its green elliptic arches. The name of Cape de Verde, is said to have been particularly suggested by the foliage of this tree. The wide trunk becomes hollow within while its diameter is augmenting, and the cavern which it forms is large enough to serve as a temple to the negroes, a hall of assembly to a tribe, or a habitation for several of their families. Its height, however, is very moderate. Mr. Golberry observed one which was twenty-four feet high, by thirty-four in diameter, and 104 in circumference. The forests of these countries, equally close with those of Guiana or Brazil, contain, like them, cocoa-trees, palms, mangroves, bananas or pisangs, tamarinds, papaws, various species of citrons, oranges, pomegranates, and sycamores.^m We also remark the courbaril,ⁿ or locust tree, a species of *Hymenæa*, which yields an agreeable beverage;^o the *Elais Guineensis*, from which oil and a kind of butter are obtained; a pea-tree, a new species of *Robinia*, found on the Gold Coast; a tree resembling the tulip-tree, forming a new genus in the Linnean class *Tetrandria*; and another, improperly called a cedar, which is a new species of *Avicennia*.^p The valuable shea or butter-tree, forms a great part of the riches of the kingdom of Bambook; but that tree, probably a species of *Croton*, belongs more properly to Nigritia.^q A species of tallow-tree, however, according to Rœmer, grows on the coast of Guinea.

It has been said that the nutmeg,^r and the cinnamon-tree,^s grow here spontaneously, though in small number, but the assertion requires to be accompanied with stronger evidence than we as yet have. It seems certain that the *Laurus cassia* grows in the forests. The existence of the coffee-tree^t is quite probable. We know that it grows to the south of Abyssinia, but we are not certain that it is precisely the Arabian species. Among other aromatic plants, Senegambia and Guinea possess a species of pepper, the *Cardamomum majus*, called, from its locality, *malaguette*, also capsicum,^u Spanish pepper, and ginger. Cotton succeeds, and even excels that of Brazil. The indigo of this country is excellent. A great number of valuable gums, which this country furnishes as articles of commerce, are well known, such as gum guaiac, the red astringent gum,^v gum copal, the inspissated juice of euphorbia,^w and dragon's blood, (*Sanguis draconis*.) The courageous and able Wadstrom, a Swede, had brought from Africa fourteen kinds of valuable woods, among which were mahogany and ebony. Several dye-woods are found here.

Alimentary plants are in great abundance. Two species of *Holcus* are cultivated, the *sorghum* and the *dourra*. There is a third species, called by Isert the *Holcus bicolor*, which is known by the Portuguese name *milho*, or millet, on the Gold Coast, and gives a return of 160 for one. Rice is cultivated in the high lands. Africa has received maize from America; but the sweet potato, which in Fetoo is called *broddi*, seems to be indigenous.^a The other esculent herbaceous plants are the yam, the manioc, or cassava, the large bean produced by the *Dolichos lignosus*, the delicious pine apple, which grows in the most desert places, and lastly, different species of melons and of pumpkins. Orange, banana, and papaw trees, have been introduced by the Portuguese, and grow in abundance and perfection.

Tobacco is found every where in great abundance; that of Senegal is excellent, but that of the Gold Coast is of the most indifferent kind. The negroes are so fond of smoking this plant, that they complain less of hunger than of the want of tobacco. The sugar-cane, though abundant and excellent, serves only to feed the elephants, the hogs, and the buffaloes, who are extremely fond of it.^b The negroes sometimes drink the juice of it. The exuberant abundance of the aloes, balsamines, *Gloriosa superba*, tuberoses, lilies, and amaranths, gives the flora of these countries a look of pomp and magnificence quite astonishing to the European traveller. The most singular feature of the African vegetation is perhaps the height to which the Guinea grass grows. This plant forms immense forests of herbage, from ten to thirteen feet in height, where flocks of elephants and boars wander unseen. The enormous *boa* serpent conceals himself in this gigantic turf. In order to render the air more salubrious, or to prepare for cultivation, the negro frequently sets fire to these savannahs, which shine in long lines during the night, resembling rivers of fire that relieve the gloom for a great way round; by day they cover the horizon with columns of smoke; and the birds of prey follow these conflagrations in flocks, to devour the serpents and lizards which the flames have suffocated. This practice has appeared to some of the learned to furnish the most natural explanation of the "torrents of fire," seen by Hanno, the Carthaginian, in his voyage to the south of *Cerne*.^c

No part of the world produces more numerous flocks of elephants, monkeys, and antelopes, deer, rats, and squirrels. In every part of Africa the elephant lives in a state of nature; he is no where tamed. The ancients justly observed, that the African elephant is smaller and less courageous than the Asiatic; but his tusks are much larger; their substance is harder, and less apt to become yellow, and furnishes almost all the ivory of commerce. The method of catching them, employed by the chiefs, is to assemble the young men and take them out into the woods; at the season when the grass is dry, they set fire to the grass all round the elephants, who, finding themselves unable to escape from the flames, perish in the conflagration, sometimes to the number of twenty or thirty, by which means the ne-

groes procure a large quantity of ivory. The hippopotamus, which lives in fresh water and marshy places, grows to a monstrous size, and is most frequently seen to the south of the river Cassemance. The rhinoceros is scarcely known even in Benin. The lion is less common than the panther and the leopard. The spotted hyæna is frequent in this country, but the common species is most common in the north of Africa. The jackal, however, is more formidable and destructive. The giraffe, which has been seen by Mungo Park and other travellers in Nigritia, sometimes wanders to these coasts.^d

The zebra is met with in droves, and the negroes hunt it for the sake of the skin and the flesh.

The most remarkable species of monkey is the *Simia troglodytes*, called *kimpanzay* in Congo. It is the jocko of Buffon, who has confounded it with the ourang-outang of India. This monkey has less approximation to the human form than the ourang-outang; but perhaps surpasses him in intelligence. They sometimes attack people, especially women who carry any provisions, and beat them with sticks till they let go their burden; when pursued and attacked, they defend themselves by hurling stones and biting; and the females which have young ones to protect, are particularly fierce and courageous in their resistance.^e A recent traveller says that this animal is far from being common.^f The hideous mandril varies according to his age; whence Linnæus has erroneously divided this species into two, (the *Simia maimon* and *mormon*.) According to a learned naturalist, it has not hitherto been found except in Guinea and Congo.^g We likewise meet with the pithecus, the hog-faced baboon,^h the hamadryad, the *Simia leonina* or macaque, the diana,ⁱ the *Simia cephus* or moustac; the Callitriche or green ape (*Simia sabæa*), the white-nose or *Simia petaurista*, and, in short, almost all the tailed apes or guenons,^k of which these regions seem to be in a particular manner the native country. Two remarkable animals, akin to the monkey tribe, have hitherto been found only in Senegambia. These are the *Lemur galago* and the *Lemur minutus*. The poto^l is common in Guinea. The Senegal negroes catch the zibet in a very young state, and tame it. Among the antelopes, or gazelles, the kob, the nanguer, and the nagor, inhabit the banks of the Senegal and Rio Volta. Some kevels and corinnes are also found: these antelopes go in numberless flocks, which often contain upwards of a thousand.^m The boar of Ethiopiaⁿ peoples the marshy woods; but the hog of this country is small and weak. The dogs are of the size of our setters, but approach somewhat to the mastiff; they do not bark, and their hair is short, coarse, and red, as in all warm countries.^o The horses of the Gold Coast are small and ugly; but Adanson admires the horse of Senegal. That river is probably the southern limit of the Berber, or Moorish breed. The ass is exceedingly handsome, and very strong. Camels are sometimes seen, but in small numbers, and never to the south of the Senegal. The negroes rear cattle, buffaloes, sheep, and goats.—The trumpet-bird, or monoceros, is found in all the court-yards of the negroes,

together with the armed goose, the Egyptian goose, the pintado, and the greater part of the poultry known in Europe. Among the multitude of birds which inhabit the forests, we remark the *Ardea alba minor*, or egret, the feathers of which form an article of trade. Beautiful parrots are in unlimited numbers. Swarms of them are seen to rise from the trees, frightened by the cries of the monkeys. Adanson saw the nest of an enormous species of eagle, or vulture, called by the natives, *n'ntann*. This nest was three feet high. Numerous families of sparrows and humming birds sport round the hut of the negro, and the immense baobab supports the nest of the enormous pelican.^a

This region is much infested by venomous insects, disgusting reptiles, and clouds of locusts. Of these, Isert distinguished more than twenty different species on the Gold Coast. Cameleons are very common. The serpents are numerous, and some of them of enormous size. M. Mollien mentions a snake, the bite of which occasioned the skin to fall off in scales, an instance of which came under his eye. There are numerous swarms of wild bees, the honey and wax of which are objects of trade among the negroes. In the sequestered forests, the termites, improperly called white ants, display their astonishing industry. Golberry saw in the woods of Lamayava, at Albrida on the banks of the Gambia, some pyramidal buildings, formed by these insects, which were sixteen feet high, and the bases of which occupied an area from 100 to 110 square feet. In these nests the wild bees generally deposit their honey, to obtain which, the natives set them on fire during the night, that they may avoid the risk of being stung by the bees.^b Crocodiles, cacholots, and manatis, sometimes inhabit, in one common society, the mouths of the great rivers. Oysters are said to fasten in great multitudes on the immersed branches of the mangroves with which these rivers are bordered. They are large, fat, and very good to eat, though less fresh and cool than those found in more northern situations. Cowries, the shells called by naturalists *Cypræa moneta*, which are used as money in all these countries, as well as in many parts of India, are fished on the coast of Congo and Angola,^c and are not brought hither from India as some travellers have asserted. We are not certain if they are found on the coast of Guinea Proper, as travellers give no precise statements on that point.^d Much coral and ambergris is also procured on all these coasts. The fishermen, in the neighbourhood of Cape Blanco, pay their boats with ambergris.^e

The mineral kingdom of these equinoctial countries is probably as rich and varied, though not in so great proportion, compared to other parts of the world, since mineral productions are not influenced by climate; but we know little of their mineralogy. Among the objects most worthy of attention are the gold mines, which are said to exist in the country of Bambook, situated between the Senegal and the Gambia, at equal distances from the two rivers. If we believe two French writers, Pelay and David, who were sent into these countries by the old French India Company to examine these mines, they are situated near the villages of Natakou, Semayla, Nambia, and Kombadyree; but these beds from which the negroes obtain gold, are

only alluvial deposits, derived from real mines, concealed among the mountains of Tabaoora. Eighty pounds of crude mixed earth, taken from a pit in the hill of Natakou, yielded 144 grains and a half of gold. The Semayla mine appears to be the richest.^f There are also gold mines on the Gold Coast at Akim, five days' journey from the Danish fort of Christianburg, but they are not very productive. At a distance of twelve days' journey farther north, near the mountains of Kong, we have reason to believe that the Accasers work a rich mine of this precious metal in the form of deep pits.^g Iron ore, in the form of silicious stones, is abundant in many places, and is smelted by the inhabitants, and manufactured into vessels with the hammer; from which we may conclude that the metal is excellent in quality, and highly malleable.^h Labat saw whole mountains of fine red marble with white veins. The negroes make fine pottery with a white unctuous earth, which is common in these countries. It is on the coast, and more especially in the rivers, near the gulf of the Idolos Islands,ⁱ that the fat clay is found, which the people are said to mix with their food like butter.

After this general view, we shall now proceed to some detailed descriptions of this wide and important region.

The fertile plains, watered by the Senegal and the Gambia, are occupied by a multitude of small kingdoms, some consisting of the indigenous negroes, and others which have been seized by the Moors. Various European powers have perceived the advantages which this country offers for colonial establishments. The French at one time had the largest and most numerous, as Fort St. Louis, and Podor on the Senegal; the forts of St. Joseph and St. Pierre, in the interior in the kingdom of Galam; the island of Goree, called by the natives Barsaghish, near Cape Verd; Albrida and Joal, on the river Gambia; Bintam, on the Cerebes river; and the island of Bissao. All these settlements are now abandoned, and the island of St. Louis is merely a factory under military government, the returns of which, in 1801, gave a population of 10,000 inhabitants, consisting in a great measure of slaves. According to Labarthe, a million and a half pounds weight of gum were exported; also 1500 negroes. The English have, besides Fort St. James, three factories on the Gambia; one at Vintain, another at Jookakonda, and a third at Pisanian: the last of which is the farthest from the sea coast. The French exported to the Senegal goods to the amount of 750,000*l.*; and the English disposed of an equal amount on the Gambia. Spirituous liquors were the chief article.

The kingdom of Owai, or Ualo, contains the lake of Panier Foule, which, in the dry season, is transformed into a fertile plain. The sovereign, who has the title of brak, (meaning king of kings,) is generally subject to the neighbouring Moors.

The Foulahs of the Senegal live above Owai. Some of their tribes enjoy a turbulent independence, such as those of Footatoro, who are also remarked to be the most insolent and inhospitable.^k The greater part of them are subject to a sovereign possessed of considerable power, who has the title of Siratik. In this country is situated Fort Podor

in the large and fertile island of Morfil,^a formed by two arms of the Senegal.

The Foulahs, who are also called Peuls or Foleys on the Senegal, are widely diffused over Africa. The great body of the nation lives about the sources of the Gambia and Rio-Grande. Besides the colonies found on the river Falémé and the Senegal, there are tribes of them to the south of Fezzan, on the confines of Bornoo, and even in the interior of that kingdom, where they are called Fellata.^b The Foulahs also inhabit the kingdoms of Massina and Tombuctoo on the Joliba, and from these parts probably the colonies went off that are now found in Bornoo. This curious fact seems to be substantiated by some collections of words of the language of these people, made in Senegambia, compared with others, communicated to M. Seetzen by a Fellata of the town of Ader, between Bornoo and Agadez.^c The Foulahs have a reddish black or a yellowish brown complexion, longer and less woolly hair than the negroes, noses less flat, and lips not so thick.^d These features seem to indicate a mixture of the Berber and Negro race. But this mixed nation, which puts the reader in mind of the *Leucathiopes* of the ancients, seems to us to have received from the Arabs not only the religious and civil influence of the Koran, but also the name which it bears, which seems to be the same with that of the Fellahs or cultivators of Egypt. The Foulahs have mild dispositions, flexible minds, and a great turn for agriculture; but those among them who live by rearing cattle, migrate from one country to another rather than submit to tyrannical rulers.

The different states of the Serracolet or Serrawoolet negroes, form a sort of confederation, of which Galam is the metropolis; but the true name of the country is Kadjaaga. The king of Galam at least enjoys a certain ascendancy over that country, which he owes chiefly to the trade of which his territories are the centre, as well as to the trade in captives, who are brought from more distant countries. By an agreement among all the Serracolet princes, the throne of Galam is occupied by their families by turns.^e These negroes are treacherous and cruel, their complexion is extremely black, and it is difficult to distinguish them from the Yalofs.^f The air of the country is purer than along the coast. The Serracolets are great smelters of iron. For hammering it they use rounded pieces of granite, encircled with a leather band fastened to thongs, which the workman holds in his hands. He raises and drops it alternately on the iron, which is placed on a low anvil in the sand, and thus fashions it into bars eight inches long.^g They are the most skilful and persevering in commercial affairs of all the negroes; and being reputed rich, their travelling merchants are obliged to pay heavier duties, in the form of presents, to the chiefs through whose territories they pass. In Galam they are great hunters. Some describe them as treacherous and criminal. Yet it is allowed by all that hospitality is practised by them in a most ample and disinterested manner.

The Mandingos have spread themselves from the country which bears their name, and which is near the sources of the Niger, eastward among the states of Bambarra, and westward among those of Bambook and Woolly. These negroes, who are not of so fine a black as the Yalofs, file down their teeth to a pointed shape. They are a sort of Mahometans, have many Arabic words, and use the Arabic alphabet.^h Their marabouts, or hermits, perform long commercial journeys, and receive visits from those of Morocco and Barbary. They are well acquainted with the interior of Africa,ⁱ and the negro slave trade is in their hands. Since the year 1100 this nation has ruled over the rich kingdom of Bambook.

The Bambookans furnish an example of the usual fate of a corrupted people. Their rich and fruitful soil supplies the inhabitants with the necessaries of life, with scarcely any labour.^k Voluptuous and indolent, they live in a state of utter anarchy, and their wealth becomes the prey of their more active neighbours. Major Houghton, however, gives them a more favourable character, representing them as an industrious people, who manufacture cotton stuffs and iron utensils.^l

The kingdom of Jallonkadoo, in which the river Senegal takes its rise to the south-east and south of Bambook, is inhabited by numerous tribes, whose language, notwithstanding the doubts of Mungo Park, seems to be a dialect of the Mandingo.^m The Jallonka race have, in general, been either converted or persecuted by the Foulahs and other Mahometans. Some fugitives, who have not renounced fetichism, have sought an asylum in the most mountainous districts, such as the mountains of Niekolo and Randeia, where they have mixed with the Youluks, and produced a mulatto breed, who are savage and wretchedly poor. They are remarked for bad and decayed teeth. On the east side of these heights, where the chief rivers begin their course, there is a remarkable difference in the domestic animals. The ass, which is found wild on the southern declivity, is here so entirely unknown, that when M. Mollien brought one with him in his travels, an animal so strange produced consternation among the inhabitants, both young and old.ⁿ

Descending the Senegal from this country, we might name kingdoms and principalities almost without number; but we shall merely notice the state of Bondoo, a pastoral country to the west of Bambook; the inhabitants of which manufacture cotton cloths,^o and dye them black with indigo.^p The country of Kasson, to the east of Galam, is considered as rich in gold, silver, and copper.

The country between the Senegal and the Gambia is chiefly inhabited by the Yalof, sometimes called the Walof nation.^q They are the handsomest negroes of western Africa. They have woolly hair and thick lips, and very black complexions, but are tall and well made, and their features remarkably regular. If we credit M. Golberry, they are a mild, hospitable, generous, and faithful

race; and their women are as attractive as jet-black females can be.

They call themselves Mahometans, but their religion has an alloy of idolatry and superstition. Their language is graceful and easy. Their chief takes the title of *Barbi-Yalof*, emperor of the Yalofs, and reigns over an extensive country, little visited by Europeans. His place of residence is Hikarkor. Rich in provisions, cattle, and poultry, this country flourishes under a more regular administration than that of the adjoining states. Justice is administered by a chief judge, who holds circuit courts over the kingdom.^a The people manufacture cotton goods.^b

Several states have separated from the Yalof empire; such as that of Baol, and that of Cayor, governed by a prince who has the title of Damel. Cape Verd, and the small island of Goree, which was fortified and embellished by the French, are in the territory of the Damel.

The most commercial of the Yalof states, is that of Salum, on a branch of the Gambia. The king's residence is at Kahan;^c his cottage is within an inclosure of great extent, which contains more than sixty others, inhabited by his wives, children, officers, and principal slaves. At its entrance are three large courts, lined with the cottages of his servants, each court being guarded by twenty men armed with javelins and hassagays. In the centre of the royal inclosure the cottage of the prince stands by itself, in the form of a round tower, thirty feet in diameter, and forty-five in height, covered with a dome twenty feet high. It is built, like all the dwellings in this part of Africa, of pieces of wood covered with millet straw, but executed more nicely than ordinary houses. The walls and the ceiling are covered with mats curiously figured; the floor is formed of a kind of stucco of red earth and sand, and covered with mats. The walls are hung round with muskets, pistols, and other arms, and horse harness. The king is seated on a low stage at the farthest part of the cottage, fronting the entrance. The kingdom has an area of 11,500 square miles.^d The population is said to be 300,000; the lands are fertile and well cultivated; the foreign commerce is extensive, particularly with the French and English, the former nation being most respected, and best adapted to the character of the people.

The Serreres, a wild and simple tribe, without religion or laws, live in the country of Sin, (or Barb-Sin,) and that of Baol. The negroes call them savages, but Europeans speak in praise of their mild and peaceful dispositions.^e

It is in works more voluminous than the present that a reader could expect to find a complete enumeration of the little principalities situated along the Gambia, together with the discussions which might arise out of the perpetual contradictions found among travellers.^f We shall notice, on the north bank of the river, the countries of Barraha, of Yani, and of Woolly, the capital of which, called Casana by the negroes,^g and known also by the Arabic term, Medina, or the city, is populous and hospitable. To the south of the Gambia, there are twenty small states which

dispute with one another their obscure existence. The most conspicuous nation is that of the Feloops, whose territories are greatly scattered, and extend from the Gambia to the river St. Dominique,^h and a little beyond it.ⁱ Savage and revengeful, but faithful to their friends, they scarcely acknowledge any government; and the paltry fetiche is the only object of their worship. Their country is flat, somewhat sandy, but rich in pasture and rice grounds, abounding in cattle, and maintaining numerous swarms of wild bees, which produce a great quantity of wax. Higher up the country there are steep mountains, composed, according to a rather unlearned traveller, of freestone.

The mutual boundaries of Senegambia and Guinea are left to the caprice of geographers. In the interior of this doubtful space, on the upper part of the Rio Grande, live the nation of the Soosos, erroneously called the Foulahs of Guinea. They have nothing in common with the Foulahs of the Senegal, though Golberry says otherwise. This is shown by the entire dissimilarity of their language.^k

Teembo, the capital of their country, contains about 7000 inhabitants. They have iron mines, worked by women, also some manufactures in silver, copper, and wood; it is said that these people can bring into the field 16,000 cavalry or upwards. They are Mahometans, but surrounded by twenty-four pagan nations or tribes, on whom they are always ready to make war, in order to procure slaves.

They live in a sort of federal republic, in which a secret association, resembling the *vehmik*, or black tribunal of the middle age, maintains order and dispenses justice. This is called the *poorrah*. Each of the five cantons of the nation has one of its own, to which the men are not admitted till they are thirty years of age. The principal members, consisting of persons above fifty years of age, form the *supreme poorrah*.^l The mysteries of initiation, accompanied with some dreadful test of merit, are celebrated in the midst of a sacred forest. All the elements are put in requisition to try the courage of the candidate. It is said that he finds himself assaulted by roaring lions, who are restrained by concealed chains. A dreadful howling is kept up over the whole forest; and a devouring fire flames around the inviolate inclosure. Any member who has committed a crime, or betrayed the secrets of the body, finds himself visited by armed and masked emissaries. On the ominous words being pronounced, "the *poorrah* sends thee death," his relations and friends desert him, and he is left to the avenging sword. Even entire tribes, which make war in contempt of the orders of the great *poorrah*, are laid under the ban, and oppressed by the united attacks of armed deputations from all the neutral tribes. This institution seems to indicate an improved degree of intelligence, and considerable elevation of sentiment.

Proceeding now along the line of coast, we find some low lands intersected by rivers, to the south of the river St. Dominique, inhabited by the Papels, who are all pagans, worshipping trees, cows' horns, and all sorts of visible objects. When their king dies, according to the report of

a traveller, the grandees range themselves around his coffin, which is tossed up in the air by some sturdy negroes, and the individual on whom the coffin falls, if not killed by the weight, succeeds to the throne.^a

They are a brave people; their only weapon is a very long sabre. Large herds of oxen constitute their chief wealth, which they fatten with rice straw. The territories of these people extend from the river Geba, to that of Cacheo, the gates of the Portuguese settlement of Bissao. And the market of that town is so dependent on them for supplies of provisions, that the Portuguese government find themselves under the necessity of cultivating habits of good neighbourhood, with having on some occasions been threatened with a famine when a good understanding was accidentally interrupted.

On the frontiers of the Papels, to the south, dwell the Balantes, a cruel and savage race, with whom the Portuguese have very little communication. Salt is the only article of merchandize which they sell. They eat dogs, and reckon rats the most exquisite of dishes.

Cacheo, a fortress, with a small town, is the station of the Portuguese authorities, and of a weak garrison to maintain in point of form the sovereignty of Portugal over this coast. There is also a fortress called Bissao, on a large island of the same name, formed by the river Geba, at its mouth. The situation is rendered unhealthy by the dampness, accompanied with the intense heat. Yet it is said rather to have the effect of rendering life sickly, than of abridging its duration. The soldiers of the garrison consist chiefly of mulattoes and blacks, with a few whites without shoes or uniform, but muffled up in robes of flowered cotton, and mostly in rags. They are on the whole much neglected by the government. All the commerce here is conducted by barter, and is exclusively in the hands of the governor, who thus acquires considerable wealth, while the inhabitants are idle and poor. In an inland situation, 160 miles up the river Geba, is the Portuguese settlement called Geba, of which M. Mollien gives a curious account. The commandant receives visits in a large hall where straw beds are placed all round, on which the negroes seat themselves indiscriminately with Europeans, and every one has complete personal liberty either to whistle or lie down to sleep, or eat at any time he thinks fit; yet none must pass the door without taking off his hat most respectfully, whether the master be within or not. The surrounding district is called Kaboo, and is inhabited by a mixture of nations, consisting chiefly of pagan Madingoes. The villages are large and populous, and the fields well cultivated. The houses of Geba are composed of mud, and there is no fort; the soldiers are negroes. The settlers are on good terms with the surrounding natives, who make war on one another's villages, and sell their captives at this place to the Portuguese. M. Mollien saw only three Europeans at this place.

The Bissajos^b islands form a smiling and fertile archipelago, surrounded, and almost covered on the west side by a series of sand and clay banks, 165 miles^c long, rendering the navigation extremely dangerous.

The soil of these islands is watered by numerous small rivers; it produces rice, oranges, citrons, bananas, melons,

peaches, and excellent pastures, on which the inhabitants rear cattle, consisting chiefly of hump-backed oxen of prodigious size. Fish are in great abundance on all their shores.

Bulam^d Island, which is the one nearest the continent, was pronounced by the intelligent M. Brue, a good place for a French settlement;^e the English hearing of the plan, hastened to anticipate it; but they treated the natives rudely; they neglected the precautions which the climate requires; their colony went to ruin, and is now annihilated.^f The useful plants grow here in great profusion, as rice, indigo, coffee, cotton, and a variety of fruit trees. But the air is humid, and proves highly deleterious when the due precautions are not observed.^g The Bissajos, or Bidjoogas, make themselves formidable to their neighbours, by their incursions, and the cruelties which they commit. Fishing and piracy are professions which they cultivate by turns. The cock is esteemed among them a sacred animal. They possess much muscular strength of arm, harsh features, and quick movements. Almost all of them have muskets, or lances, which they use with much address. Their petty chiefs have turbulent subjects and tempestuous courts. The family of a minister is sometimes ordered by the caprice of a despot to be sold into slavery. Fertile as this archipelago is, the diet of the inhabitants is extremely simple. Zealous friends of the Portuguese, they bear an implacable hatred to other-European nations.

The Portuguese have numerous settlements along the banks of the Rio Grande, especially on the south bank. Entire villages are peopled by their colonies; but the English are much more successful, than they are, in commerce. The north bank of the river is occupied by the Biafars, called also Jolas, who possess all the track that lies between the Geba and the Rio Grande. This people are almost continually at war with the Papels; but they are much gentler, and more tractable, and suffer much from the former, to whom the wealth acquired by their industry presents strong temptations. Here we find the town of Ghinala, where the king resides; Beguba, and the river of the same name; Balola, and several Portuguese settlements, the largest of which is at Caooda, about 140 miles^h from the mouth of the river. The south bank is inhabited by the Naloes, a negro race so completely mingled with the descendants of the original Portuguese, as not to be distinguishable from them. Their pursuits are agricultural and pastoral, and their country is exceedingly fertile. The Portuguese have introduced among them some useful knowledge; their well cultivated fields produce the best indigo, and the finest cotton. The cloths which they manufacture from the latter substance are highly valued for the fineness of their fabric, and they have the art of dyeing them with beautiful colours, which make them objects of demand with the adjoining nations. Their principal river is the Nuno-Tristao, called by some writers Nonunas, a name which appears favourable to the views of those who wish to identify it with the river Nunius of Ptolemy; but both terms are of Portuguese origin.

The islands of Los, where some English merchants have formed a settlement,ⁱ owe their present name to the Portu-

guese, being a corruption of *Yola de los idolos*. The native inhabitants are called Forotimah.

Immediately to the south of this Portuguese line of coast we find the English settlement of Sierra Leone, formed in 1787, for the express purpose of labouring to civilize the Africans. In this quarter the English have made the greatest exertions to limit, if not to abolish the trade in slaves, but philanthropy, and penal statutes, and vigilance, have been found but feeble barriers, when opposed to the cupidity of unprincipled traders. It is computed that there are not less than three hundred vessels on the coast, engaged in this disgraceful traffic, which is probably carried on to as great an extent at this day as at any former period. It appears from papers recently laid before the British Parliament,^a that the whole line of Western Africa, from the river Senegal to Benguela, that is to say, from about the latitude of 15° north, to the latitude of about 13° south, has, during that period, swarmed with slave vessels; and that an active and increasing slave trade has also been carried on, upon the eastern shores of that continent, particularly from the island of Zanzibar. Not less than 10,000 liberated slaves, from the slave ships captured by British cruisers, were calculated to be in the colony in 1821. The landing of these cargoes is often a very affecting scene. The poor creatures, delivered from the hold of a slave ship, faint and emaciated by harsh treatment and disease, when received with kindness and sympathy by the inhabitants, among whom, perhaps, they recognise a brother, a sister, or countryman, whom they had supposed long since dead, but whom they are astonished to see clothed and clean, are overwhelmed with feelings which they find it difficult to express.^b On their arrival, those of a proper age are named, and sent to the adjacent villages. A house and lot is appointed to each family; they are supported one year by government, at the expiration of which they are obliged to provide for themselves. The captured children are also sent to villages, where they are kept at school till married, which is always at an early age. At the head of each village is a missionary, who acts in the double capacity of minister and schoolmaster. The number of persons attending the schools in January, 1821, was 1959.

The African Institution endeavours to promote a friendly intercourse with distant, as well as neighbouring countries. The natives of Foulah resort to the colony to participate in the advantages of legitimate commerce; and it may even be expected, that some years hence, caravans will resort to the neighbourhood of Porto Logo, (on a branch of the Sierra Leone,) to convey the manufactures of Europe into the very interior of the continent of Africa.^c Trade is rapidly increasing. The total invoice amount of imports at the port of Freetown, for the year 1820, was 66,725*l*.

^a Report of Commodore Sir G. R. Collier, Dec. 27, 1821.

^b Sixteenth Report of the African Institution, p. 328.

^c Sixteenth Report of the African Institution.

^d Sierra Leone in 1825 contained 18,000 inhabitants; of whom about 12,000 consist of liberated Africans, who, for the most part, occupy the parishes in the mountains, where they inhabit villages, surrounded by tracts of cultivated ground, and containing schools for both sexes. In 1823, the timber trade on the river Sierra Leone furnished 15,000 loads for the British market. The invoice value of the cargoes imported into the colony, the same year, was £121,442 18*s*. 11*d*. The exports consisted of ship timber, camwood, palm oil, elephants' teeth, gold dust, copal, bees-wax, rice, and malaguetta pepper.—19th Report of the African Institution.—P.

^e Sixteenth Report of the African Institution, p. 354.

^f Afzelius, in the Report on Sierra Leone, addressed to the Proprietors, Curry, p. 37.

9*s*. 4½*d*.; and, for the same period in 1821, the amount was 105,060*l*. 15*s*. 10¾*d*. being an increase of 38,335*l*. 6*s*. 6*d*.¹

The exertions of the African Institution, aided by the Missionaries of the Church of England, have effected a remarkable improvement in the morals of the inhabitants, who are stated to be generally contented and industrious.

The total population of Sierra Leone, by the latest returns, is computed at 17,000. Besides Freetown,^e there have been built Regent's Town, which contains nearly 2000 inhabitants, and the towns of Gloucester, Leopold, Charlotte, and Bathurst, all of which appear to be thriving. A little to the west of Sierra Leone is Krootown, a small village inhabited by about 500 Kroomen. The British ships of war on the station, have each from twenty to seventy of these men in their books, who are said, whatever their pilfering habits may be on shore, to behave with the utmost propriety on board of ship. A fort, erected on the Island of Bance, commands the entrance of the river, which has been ascended by Europeans beyond its picturesque cataracts. In this country indigo grows well; several varieties of coffee are known;^f the citron is degenerated, and its fruit resembles lemons. All the esculent and aromatic plants of Africa are in great abundance. The gum of the butter-tree is used as a yellow dye; the *colla* bark seems to belong to a species of *cinchona*.^g The pullam-tree produces a silky cotton. The chimpanzee monkey is met with in the interior; an animal five feet in height, with a pale face, the hands and stomach without hair, habitually holding himself erect, and even, it is said, sitting like a man; circumstances which make him highly interesting to the naturalist.^h

When the Portuguese discovered these places, they called the promontory to the south of the present settlement Cape Ledo, and the mountains in the interior Serra Leona, or "the Mountain of the Lioness." This name, somewhat disfigured, has been since given to the Cape, the river, and the adjacent district.^{i k}

The English seamen have given the name of the Windward Coast to all that lies between Cape Mount and the river Assinee,¹ and they divide it into three parts, the Grain Coast, which terminates in Cape Palmas; the Ivory Coast, bounded on the east by the river Frisco or Lagos; and the coast of Adoo or Quaqua, comprehending the remainder. All that part lying between Capes Palmas and Apollonia, is generally included under the name of the *Côte des Dents*,^m or the Ivory Coast. The English themselves differ in their application of the term Windward Coast; some of them extending it no farther east than Cape Palmas.ⁿ The Gold Coast begins either at Cape Apollonia, or the river Assinee, and is generally considered as termi-

⁴ In 1822 Major Laing was sent on a mission to the Soolmas, 200 miles eastward of Sierra Leone, near the great granite chain, or Kong mountains. Their capital is Falaba, said to contain 4000 houses. They are peaceable and industrious at home, but often engaged in war. Agriculture and the arts are considerably cultivated. On his route, he passed through the territories of the Timannees and Koorankos, the former of whom are indolent and corrupt, probably from their connection with the coast; the latter industrious, and, like the Soolmas, skilled in some of the arts, particularly in the working of iron and leather.—P.

⁶ Tooth Coast.

⁷ Clarkson's Essay on Slavery, p. 29. Newton's Thoughts on the African Slave Trade, at the beginning

nating at the Rio Volta. Then comes the Slave Coast, that of Benin or Wara,^a that of Calabar, and that of the river Gabon. All these countries taken together form Guinea in its strictest acceptation, which we shall here retain.

Between Cape Mount and Cape Palmas, the coast produces abundance of rice, yams, and manioc. The cotton and indigo of this country are of the first quality.^b The articles for which Europeans have hitherto visited it are malaguette pepper, red wood, and ivory. The inhabitants are skilful and intrepid rowers, but distrustful of Europeans. The negroes on the banks of the river Mesurado speak a corrupt dialect of Portuguese, and acknowledge themselves vassals to Portugal, but are not, as some have supposed, Europeans changed to negroes by the power of the climate.^c Sesthos, or Sestre, is a pretty large negro town. The houses are in the form of conical huts two stories high.^d

The old travellers, consulted by Dapper,^e assign a place here to the kingdoms of Quoya and Hondo, which they describe as dependent on a more powerful kingdom in the interior, the inhabitants of which were called Mendi-Manoo, that is, the governing people. The word *manoo*, or *monoo*, an epithet common to all the tribes of these nations, has a striking affinity to the word *mannoo*, which signifies man in the dialect of the Sokkos, a people, of whom Oldendorp, the missionary, knew some individuals at Saint Croix, and who must live to the north-west of the Aminas.^f The Sokkos are neighbours to the Uwangs. The specimens of their language given by Oldendorp, resemble the Jallonkadoo words given by Mr. Park. The king of the Sokkos has many princes under him, and takes the title of *mansa*. There are presumptions of the identity of the Sokkos with the Mendi-Manoos. In manners and laws, these people bear some resemblance to the Soosoos. They have a secret tribunal, a mysterious order called *Belli-Paaro*, similar to the *poorrah* of the Soosoos.^g At the funeral of a man his favourite wife is sacrificed by the priests and thrown into the grave of her husband. The Sokkos, whom Oldendorp knew, said that baptism and circumcision were among the religious practices of their country, from which a learned geographer rather boldly attempts to infer some connection between the nations of Guinea and the Abyssinians.^h These Sokkos, it must be remarked, are entirely different from the Asokkos, in the country of the Issinese, on the Gold Coast,ⁱ which appear to us to be the Insokkos of M. Ehrmann,^k though M. Bruns says^l that he could not find the Insokkos.

Two other traditions are worthy of our notice. The na-

tions now mentioned have been subdued by the Folgians, who are probably the southern Foulahs. Another nation called the Gallas^m has been expelled from these countries,ⁿ but to look in these for the Gallas on the confines of Abyssinia, is to confound the negro and the Caffre race with each other.

The Ivory Coast, as far as Cape Lahoo, is inhabited by a warlike nation of a dark unsociable disposition, at least towards Europeans, and according to report addicted to cannibalism.^o The Portuguese have surnamed them *malas gentes*. The coast is adorned with natural orchards. In the river St. Andrew, elephant's teeth are exposed for sale weighing 200 lbs. The animal called quogelo, mentioned by Desmarchais, does not resemble any species known to us.

To the east of Cape Lahoo, are the Quaquas, or Good People. These are divided into castes like the Hindoos and ancient Egyptians, and the son uniformly follows the profession of his father.

The Gold Coast derives its name from the great trade in gold dust carried on in it, which has given rise to many European establishments. It also abounds in fish, the chief of which are the sea bull, and the fish called from its shape, the hammer.

The forts and factories belonging to Europeans in this quarter, are about forty in number, fifteen Dutch, fourteen English, four Portuguese, four Danish, and three French. At present most of them have been destroyed or deserted, which some ascribe to the abolition of the slave trade;^p a circumstance which, if true, would indicate that they were concerned in a business less innocent than the trade in gold dust. The Dutch trade was concentrated at Elmina. The principal English establishment was Cabo-Corso.^q The head quarters of the Danes was Christianburg;^r the Danish forts of Printzensten and Kongesten are well built. The Danes commanded the Rio Volta, and were in great favour with the tribes on the coast.

A learned Dane, M. Isert, went into the country of Aquapim, fifty-six miles^s from Christianburg. The country seemed beautiful, fertile, and populous. It is generally well wooded, yet more salubrious than the sea-shore, and agreeably diversified with mountains, valleys, and hills. Water, which on the sea shore is scarce and brackish, is good and plenty in the interior. At the distance of about five Danish miles from Christianburg, a chain of mountains begins, which is covered with tall trees, and composed of coarse-grained granite, gneiss, and quartz. The information obtained by the researches of the African Association of London coincides with the accounts of M. Isert.

^c *Colony of Liberia*.—In Dec. 1821, the American Colonization Society effected the purchase of a tract of territory at Cape Montserado, (Mesurado,) on which a settlement was made soon afterwards. The colony at first was disturbed by the native blacks, who made two attacks upon it, in large bodies, (Nov. 1822,) but were repulsed with great loss. Since then the colony has received continual accessions from the United States, and been rapidly improving. Additional purchases have been made in the vicinity, particularly on St. Paul's river, N. of the Mesurado, and Stockton creek, which opens an inland communication between the two rivers. The first and principal settlement is at Monrovia, on Cape Montserado, which is fortified, with a government house and stores, churches, and schools. Farming settlements are formed at Caldwell on St. Paul's river, and on Stockton creek. Several trading factories are established along the coast, over which the society have a qualified jurisdiction, for 150 miles, from Cape Mount to Trade-town. This jurisdiction secures to them the trade of the country, and precludes all Europeans from any possessions within these limits. It also enables

them to put a stop to the slave trade. The population of the colony exceeds 1200, and the trade is already considerable. Cape Mesurado is in lat. 6° 13' N., 250 miles S. E. of Sierra Leone.—P.

^s 20 Fr. leagues.

In the neighbourhood of the sea, the soil of Guinea is in many places light and sandy, and consequently unfavourable to the culture of the greater part of tropical productions. In places where the soil is of a different character, the vegetation of many plants is opposed by other circumstances. Among these are the coolness and moisture of the sea-breezes, or south-west winds, which meet with nothing along the coast to interrupt their progress; the saline impregnation which the earth derives from the sea; and the surf, which is general and violent. At a distance of two or three miles from the shore, the soil becomes more productive, and improves progressively, till, at a distance of eight miles, it becomes very fertile, and fit for all the crops reared in intertropical situations. The climate at the same time is sufficiently temperate to admit of the vegetation of the different grasses and trees of Europe.^a

These observations apply in a particular manner to the Agoona country, of which Wimbah, or Winnebah, is the capital. All the lands of this district are in common. No person is allowed to become proprietor of more land than he can cultivate with his own hands: scarcely a tenth part of the land is cultivated. Each individual may occupy and till whatever portion he pleases; but if he leaves it untilled, he cannot prevent another from seizing it in the same temporary way. The purchasing and measuring of land are unknown among the natives. It is never sold except to Europeans. The latter are safe from all disputes about their right of possession; but they are not equally sure of enjoying the benefit of their crops, unless they have an adequate force to defend them from the licentious covetousness of the natives.

Though the whole Gold Coast exhibits one general character in its soil and climate, there are essential differences in some particulars. For example, the Anta country, which the river Ancobra separates from the State of Apollonia, has a rich soil, plenty of wood, is well watered, and industriously cultivated. It has harbours and good roadsteads. The state of Apollonia is still better watered with lakes and rivers; it contains more flat land adapted to rice crops, sugar cane, and other species which require humidity. The chief disadvantage under which this coast labours, is a violent surf, which makes the landing very dangerous. The form of government is the most absolute despotism, which operates as a preventive of many of the disorders which are common in the adjoining countries. Africa unfortunately is obliged to look to slavery for its safety. Among the pretended republics, or rather turbulent oligarchies of the Gold Coast, the warlike state of Fantee is the most powerful and the most regularly constituted.^b

The interior is occupied by two powerful nations. The Aminas, who have plenty of gold, extend in a north-western direction through a space of fourteen days' journey.^c Their language, which has become known by the researches of the Danes, prevails over a great part of the coast.^d The Ashantees^e in the north-east, seem to be the Argentinians of a certain French writer.^f A king of this nation in 1744, made a very distant expedition to the north-east,

marching twenty-one days through a well wooded country intersected by rivers; fourteen days were employed crossing a sandy desert where no water was found. The Mahometan nation which it was his object to attack, surrounded him with an immense army of cavalry, so that he returned with a slender remnant of his force, bringing along with him a great number of books in the Arabic language, which afterwards came into the hands of the Danes, and probably are now in the royal library of Copenhagen.^g The learned Mr. Bruce thinks that this Mahometan country was Degombah, the same which was visited by the sheriff Imhammed, and Timbah, mentioned by Oldendorp, from information derived from the negroes. The Timbah nation is called by the Aminas, the Kassiante.

The Slave Coast, in the strictest acceptation, includes the states of Coto, Popo, Whidah, and Ardra. The maritime flat country here is broader than that of the Gold coast, and extremely fertile. Poultry are in uncommon abundance, and the air is darkened by flocks of bats like dense clouds. The French had a trading settlement at Whidah, or Juda, and the Portuguese sell their tobacco at Porto-Novo. The small states on the sea-coasts are subject to the king of Dahomey, who by his conquests raised himself from the rank of a small proprietor,^h to that of a great African monarch. He has only about 19 milesⁱ of sea-coast, and though he can bring into the field 8000 men, yet being every where surrounded by enemies, he would soon be expelled from the maritime parts, if he were not supported by the European forts. His villages are large and populous. Abomey, the capital of his kingdom, is situated at a distance of eighty miles^k from the coast, and contains 2400 inhabitants. The king has two pleasure-houses at Clamina and Agona, where he most commonly lives. These palaces are only a better sort of cottages, contained within a park more than half a mile round, inclosed by an earthen wall. In this place there are 800 or 1000 women, armed with muskets or javelins. These light troops form the king's guard, and from them he selects his aides-de-camp and his messengers. The ministers leave their silk robes at the gate of the palace, and approach the throne walking on all fours, and rolling their heads in the dust.

The ferocity of these kings almost surpasses conception. Mr. Dalzel, the English governor, found the road to the king's cottage strewed with human skulls, and the walls adorned and almost covered with jaw bones.^l The king walks in solemn pomp over the bloody heads of vanquished princes or disgraced ministers.^m At the festivals of the tribes, to which all the subjects bring presents for the king, he drenches the tomb of his forefathers with human blood. Fifty dead bodies are thrown round the royal sepulchre, and fifty heads stuck up on poles. The blood of these victims is presented to the king, who dips his finger into it and licks it.ⁿ Human blood is mixed with clay, to build temples in honour of deceased monarchs.^o The royal widows kill one another till the new sovereign puts an end to the slaughter. The people, in the midst of a joyous

festival, applaud these scenes of horror, and with delight tear the unhappy victims to pieces, yet they abstain from eating their flesh.^a

The king of Dahomey is tributary to the king of the Eyeos,^b a very powerful nation, whose territories are north-east from Dahomey, and extend to the banks of a large lake, from which several rivers take their rise, and fall into the Gulf of Guinea. May not this be the lake of Wangara? The Eyeos are considered as contemptuous with Nubia; which is certainly an exaggerated statement. The king, whose numberless cavalry forms his chief force, lives 150 German miles^c from the coast. The Eyeos are a war-like people. They have among them extensive cotton manufactures.^d

East from Dahomey, and south from the Eyeos, lies the kingdom of Benin, the king of which can bring 100,000 men into the field. The river, which the Portuguese call Rio-Formosa, is very broad at its mouth, and has been navigated as high as Agathon, one of the chief towns, about forty miles^e north-east from the sea. The road from Benin to Agathon is much frequented, and lined with very large and lofty trees, which afford an abundant shade. The city of Benin, on the river of the same name, is surrounded with deep ditches, and there are traces of an earthen wall by which it has been protected. The streets are fifteen feet broad; the houses low, covered with the leaves of the macaw tree,^f and kept exceedingly clean. There are no stones in this country, and the soil is so soft that the river detaches several acres at a time. The floating islands thus formed are the dread of seamen.^g The vast palace of the king, on the outside of the city, is defended by walls; it contains some handsome apartments, and fine galleries supported by wooden pillars. The market is not exactly adapted to the taste of Europeans: the leading articles are dog's flesh, of which the negroes are very fond; roasted monkeys, bats, rats, and lizards; it also contains delicious fruits, and goods of all descriptions. The climate is one of the most deadly to the European constitution. M. Palisot-Beauvois calls it pestilential.^h Between three and four thousand slaves were purchased here by the traders.

The inhabitants of Benin have the same laws and customs as the people of Dahomey. The king, who is venerated as a demi-god, is believed to live without aliment, and when he dies, is believed only to lose his former body, in order to revive under another shape. At the festival of yams, he plants a root in a pot of earth in the presence of the whole people. Immediately after it, another pot is presented with a juggling dexterity, containing a root which has begun to sprout. This miracle inspires the credulous spectators with the hopes of a good harvest. Human sacrifices form part of the propitiatory worship offered to the avenging or evil genius. The victims, who are generally prisoners of war, when immolated, amidst the dreadful vociferous songs of the whole people, show a most stupid indifference. At the festival of corals, the king and all the

grandees dip their coral necklaces in human blood, sup-
plicating the gods to preserve for them this high mark of their dignity.ⁱ

The kingdom of Waree^k comprehends the flat marshy countries to the south of Benin, where there are a number of rivers, probably branches of the Rio Formosa. After Cape Formosa, the Calabar^l country begins, which is also intersected by many rivers, among which is the river Rey, or New Calabar, which admits vessels of 300 tons. The sovereign has the title of *délémongo*, or "the Great Man."^m The island of Bonnyⁿ is a great slave market, and, along with Calabar, used to export 14,000 annually. A part of this coast is covered with layers of sea salt. After the high land of Ambosès, which seems to contain volcanoes equalling the Peak of Teneriffe in height, we arrive at the river of Cameroons,^o or Jamoor, the mouth of which is very broad. It has a good harbour, and the water is good and sweet. Here wax, elephants teeth, red wood, and refreshments, are to be had at reasonable prices, and the Dutch carry on a great trade with the natives. The river of San-Benito is 110 miles^p beyond it. From the shore a double range of very high mountains^q is seen at a distance of thirty or forty miles.^r About forty miles^s from the mouth of the river is Cape St. John, which is dangerous to navigation, from a sand-bank about a league out at sea. This Cape forms, with Cape Esteiras to the south, a bay, in the middle of which is the island of Corisoo, which has never been particularly explored. The river of Gaboon^t to the south of this Cape in the Pongo country, is only twenty-eight miles^u from the equator. The approach to it is rendered difficult by the prevailing currents. There are two small islands at the mouth of the river; one called King's Island, because it is the residence of a king; and the other called the Island of Parrots. The negroes along this coast are a bold and hardy race.

The gulf, which is bounded by Cape Formosa on the north-west, and on the south by that of Lopez-Gonsalvo, takes the name of the Gulf of Biafra.^x It contains the islands of Fernando-Po, St. Thomas, and Prince's Island, which we shall describe in another place.^y

The nations of these coasts are very little known. The Calbongos live on the San-Benito, and the Biafras on the Cameroons. In the interior, an African has informed us of the *Ibbo*^z nation, to which he himself belonged, and which seems to furnish the greatest part of the slaves exported from Benin. He had travelled between six and seven months from his native district to the smiling and fertile valley of Essaka, on the coast of Calbari. In every part yams, bananas, pumpkins, and sugar canes, were in abundance: the cocoa tree was rare. There is a town called Timmah, situated on a lake. He had also seen a great river, but does not give any certain account of its direction.^a The vague notices of this traveller serve rather to excite than to satisfy the curiosity of geographers.

BOOK LXVII.

THE RIVER NIGER AND NIGRITIA.

HAVING gone over some countries which are imperfectly known, we now come to regions of which we know nothing. We must penetrate, in imagination, these central parts where European travellers have merely touched the outskirts. Not having it in our power to describe them, we proceed to discuss the vague traditions and contradictory reports, which show us that this hitherto inaccessible country contains great rivers, opulent cities, and numerous nations, which are concealed from our view.

In our history of Geography, we give a rapid account of the knowledge obtained, and the conjectures formed, by the Greeks, Romans, and Arabians, concerning these countries. Ptolemy, the best informed of the ancient geographers, as commented on by the most learned of the moderns, M. d'Anville, makes mention of two great rivers, the Ghir, which runs from south-east to north-west, nearly like the Misselad, or Bahr-el-Gazel, in our modern maps; the other, the Niger, runs nearly in the direction of the Joliba, from west to east. But in following the literal meaning of Ptolemy, we are not certain that this author thought all that his commentator makes him say. He seems to give the Niger two outlets; one westerly in the Lake *Nigrites*, the other easterly in the Libyan Lake, besides different canals of derivation designated by one of the most ambiguous words in the Greek language, (*εξβολη*), a word which may signify the mouth of a river, or a place where roads separate, or a canal,^a or a simple bending. Taking advantage of these uncertainties, and applying to the interior the system of M. Gosselin, which contracts Ptolemy's map two-thirds, it has been attempted to prove that the Ghir and the Niger of Ptolemy do not belong at all to Nigritia, but were only small rivers on the southern declivity of Mount Atlas.^b The great characteristic mark given by Pliny, to wit, the position of the Niger between the Ethiopians and the Libyans, *i. e.* between the negroes and the Moors, appears to us conclusive against these recent hypotheses. Perhaps it would be sufficient to limit a little the information of Ptolemy, by extending it no farther west than Lake Djibbie.^c Agathemerus, who confounds the Ghir and the Niger with one another, still makes this one of the largest rivers in the world.

The Arabians indeed furnish us with more numerous particulars than Ptolemy; but the contradictions contained in their accounts render them very difficult of application. "The Nile of the negroes," says Edrisi, "runs from east to

west, and falls into a sea, (or *the sea*,) at the distance of a day's journey from the island of Oolil. The dwellings of the negroes are along this river, or along another which falls into it."^d Leo Africanus applies Edrisi's description of the Nile of the negroes to the river Niger. He even expressly says that this river falls into the ocean, but still he acknowledges that some authors make it run from west to east, and terminate in a great lake.^e Shehabeddin is the only Arabian author who asserts that the Nile of Djenawa does not reach the ocean, but ends its course in the deserts.^f All of them mention, like Ptolemy, many fresh water lakes which must be formed by rivers.

Applying the name of the Nile of the Negroes to the Misselad, and supposing that both this river and the Niger lose themselves either in lakes or in the sands, D'Anville, and, long after him, Rennel, have constructed maps, half traditional and half hypothetical, which are usually followed with more or less modification.

But a very able geographer, M. Reichard, has proposed an important alteration, which amounts to more than a mere modification. Allowing the Niger and the other rivers the general direction assigned to them by D'Anville and Rennel, he adds an outlet connected with the Gulf of Guinea. "To the west of Wangara," says this author, "the Niger has a southerly course; and the Misselad, after having traversed the lake of Fittree, then that of Semegonda, leaves this last in two leading branches, which encircle Wangara and fall into the Niger; then this last river continues in a south-westerly course, till it terminates in the Gulf of Guinea, where it forms a delta between its western branch, the Rio Formoso, and the eastern one, the Rio-dél-Rey."^g This opinion he supports by the following train of argument.^h

Rennel supposes that all the waters produced by the inundation of the Niger, the El-Gazel, the Misselad, and the other rivers which water Wangara, are dissipated by evaporation. The principles of natural science will not allow us to admit such a supposition. Wangara is a fertile populous country, covered with towns. The tropical rains occasion annual inundations. The rivers begin to overflow about the middle of June, they are at the highest in August, and are restored to their usual state in September.ⁱ This is generally understood. When the waters have subsided, the country must be sufficiently dry for cultivation. Let us allow three months, *i. e.* till the end of December,

ⁱ Browne, ch. XVIII. Hartmann, Edrisi Africa, art. Wangara, p. 47, &c. quoted by Reichard.

for complete evaporation, although Edrisi says that the inundation continues no longer than that of the Egyptian Nile. Browne, in his chapter on vegetation, says that in this climate the ground is dry for seven or eight months. The meteorological observations made by this traveller for two years, make the usual heat of these countries in those months 85° of Fahrenheit. The temperature of Wangara must be still warmer. Let us allow that the thermometer in general rises to 90°, and that, in this burning climate, the evaporation of water exposed to the sun will be three Parisian feet in a month. This estimate is certainly not too low, for it allows an evaporation three times as great as takes place in our temperate climate during one of the warmest months of the year.

Then calculating what may be the mass of water which the Nile pours into Wangara, M. Reichard finds for the three months of the inundation, 14,226,969,600,000 cubic feet. "The surface of this country, which Rennel, after Edrisi, estimates at 370 miles in length, by 170 in breadth, is 22,595, or, in round numbers, 2260 square miles, equal to 1,182,119,594,000 square feet, the length of a mile being about 22,870 feet. According to this reckoning, the Niger alone would pour into the basin of Wangara a mass of water more than fourteen feet deep. But, says M. Reichard, this is only one of the rivers. On all sides from Bornoo, from Kookoo, from Baghermi, from Bergoo, from Foor, from Medra, the waters of Africa flow into Wangara. We may reasonably consider these put together as equal to the Niger, for, as their course is shorter, they lose less by evaporation and absorption in the soil than the Niger, which comes from a distance three or four times greater. Taking the quantity of water supplied by these rivers at one half of what this calculation would make it, there will be seven billions of cubic inches of water; which will make the depth of that which is brought into Wangara more than twenty-one feet. But since only nine feet can be evaporated in three months, more than seven months will be required to dry the surface; which, added to the three months of the inundation, will only allow the inhabitants two months for seed-time, growth, and harvest. The expenditure of the water cannot, therefore, be accounted for by evaporation alone."

This first argument of M. Reichard is not perfectly conclusive. His calculations cannot be depended on. The existence of a great lake would explain the whole difficulty. But let us hear his other reasons, which give support to one another.

Edrisi says that the Nile of the negroes surrounds Wangara the whole year. From this testimony that country has received the figure which we find given to it in our maps. The Niger, which comes from the west, is divided into two below Ghana. The northern arm runs straight east; the southern one forming an elbow, corresponding to the surface of Wangara, turns round again to the north, and both fall into the Lake of Semegonda. This at least is what may be conceived to take place. But is this result just and conformable to the nature of things? Can we suppose a river which is navigable the whole year, and one or two English miles broad, will fall into a lake which has scarcely twenty or twenty-five square miles of area, without making it rise high above its banks. For the Niger alone a lake would be required as large as the sea of Aral. The opinion is still more untenable when we consider that the Lake of Semegonda also receives all the rivers which come from Bornoo, Kanga, Begharmeh, Bergoo, and Foor,

and particularly the Misselad, which is of great size, and never dried up, and that all these are brought thither by the discharge of Lake Fittree, their point of union. It is only in this way that the communication of the rivers mentioned by Edrisi can be explained. He gives to the Nile, which surrounds Wangara, a general direction to the west. It must, therefore, be the Misselad, and, as Hornemann says that this river flows out of Lake Fittree, the communication of the waters of the Kaagoo with the Lake of Semegonda, alleged by Edrisi, is confirmed. But the last lake being too small to contain all these waters, one of the two branches which issue from it must run west, the other south or south-west, and fall into the true Niger at a great distance from each other. The true Niger, therefore, can only water the western part of Wangara, and then proceed in its course.

The examination of the nature of the country in Benin furnishes M. Reichard with the most specious of his arguments.

"The countries of Benin, of Owarah, New Calabar, and Calbongo, are," says he, "the Delta of a great river which comes from a great distance in the north-west."

The accounts collected by Nyendaël, Bosmann, Dapper, and the two Barbots, inform us that the Rio Formoso is eight marine miles in width at its mouth. Higher up, it is four, and in still higher situations it is sometimes wider, sometimes narrower. It separates into an infinite number of arms, which spread over the whole adjoining country. A communication can be kept up in boats from one arm to another. There is also, in the interior, a passage by water to the Calabar, easily sailed in a canoe. From the Rio Formoso to the west bank of the Cameroons River, the coast is very low and marshy, and preserves the same character to a considerable distance in the interior. This whole country forms one immense plain, intersected by large, navigable rivers, such as those of Forçados, Ramos, Dodos, Sangama near Cape Formoso, Non, Oddi, Filana, Saint Nicholas, Meas, Saint Bartholomew, New Calabar, Bandi, Old Calabar, and Del-Rey. This last is seven or eight miles broad at its mouth. It preserves this breadth a considerable way up, and comes from a great distance to the north. All these rivers belong to one principal river; for the Rio-del-Rey coming from the north, and the Rio Formoso from the north-east, the two lines which they follow should intersect one another forty or fifty geographical miles farther north, each having a separate course of at least two hundred miles. Then we may reasonably give their course, in a united state, a length of three or four hundred miles. The extent must indeed be almost unexampled, since the Delta, including the projection of Cape Formoso, occupies ninety miles along the coast, and contains so many branches of rivers. In size it far surpasses the Delta of the Ganges.

The physical circumstances of this Delta furnish an auxiliary argument. Composed of mud, and destitute of stones, it must have been formed by periodical inundations from one or more great rivers. We know also from James Barbot, and from Grasilhier, who were eye-witnesses, that all the country about New Calabar and Bandi is every year inundated in the months of July, August, and September. The coincidence of the time of overflow with that which takes place in Wangara and Foor, is too striking not to produce some presumption that the two countries are connected together by the same river. Lastly, capsicum, which is very abundant in Benin, is equally so

in Dar-Kulla, which seems to show that these countries are not separated by any mountain chain; a circumstance rendered very probable by other concurring reasons.

To these arguments of M. Reichard, which appear to us to merit the greatest attention, we shall add another, which has certainly some weight. The Arabs speak of an island called *Oolil*, at the mouth of the Nile of the Negroes, as the only country in Nigritia that has salt marshes or pits,^a and a place from which much salt is exported.^b Another writer makes *Oolili* a city. Now, at the mouth of the Old Calabar river there is an island called the Salt Land,^c which is covered with a layer of sea salt, and the Portuguese charts copied by D'Anville mark a town called *Olil* on the mainland. The distances assigned by the Arabs would place the island of *Oolil* in a great inland lake, but the singular coincidence of the names and of physical characters is not the less favourable to the hypothesis of M. Reichard.

At the very time when this hypothesis appeared to be established, an opinion diametrically opposed to it, and the least probable of all that had been advanced, has been again brought forward. It is nearly that which was given by Pliny the naturalist, who considered the Niger as the principal branch of the Nile, allowing, however, that it frequently disappeared under ground. Some of the contradictory testimonies of the ancients and of the Arabians may be ingeniously combined in favour of this opinion;^d but the only powerful argument is derived from a recent account of a journey performed by water, from Tombuctoo to Cairo. This account has come to us in an indirect channel. Mr. Jackson, British consul at Mogadore, collected from the oral declaration of a Moroccan, who had visited Tombuctoo, various particulars, by means of which, he wishes to demonstrate the identity of the Niger with the Nile.^e

"The Nil-el-Abeed, or Nile of the Negroes," says this writer, "is also called Nil-el-Kebir, or the Great Nile; that of Egypt is called Nil-el-Masr, or Nil-el-Sham, from the Arabic terms for Egypt and Syria. The inhabitants of Tombuctoo, and the whole of central Africa, maintain that these two rivers communicate together, and even that they are the same river. The Africans are surprised when they hear that the Europeans make them two distinct rivers, experience having taught them otherwise.

"In the year 1780, a society of seventeen negroes of Jinnee went from Tombuctoo, in a canoe, on a commercial speculation. They understood Arabic, and could read the Koran. They exchanged their goods repeatedly in the course of the passage, and in fourteen months arrived at Cairo, having lived on rice and other provisions, which they procured in the different towns which they visited. Their report is, that there are 1200 towns and cities, containing mosques or towers, between Tombuctoo and Cairo, on the banks of the Nile of Egypt and the Nile of Soodan.

"They stopped occasionally a few days at several towns to transact business, or gratify inclination or curiosity. In three places they found the Nile so shallow, in consequence of numerous canals of irrigation connected with the main branch, that they could not proceed by water, and there-

fore carried their vessel over land till they found the river broad and deep enough to permit them to proceed by water. They also met with three cataracts, the chief of which was at the western entrance of Wangara. They carried their boat by land past this cataract, then launched into an immense lake or merja, which could not be seen across. In the night they used a large stone by way of anchor. They kept regular watch, as a precaution against the attacks of crocodiles, elephants, and hippopotami, which abounded in many places. When they arrived at Cairo, they joined the great caravan of the west, (Akkabah-el-Garbie,) and went with it to Morocco, and from Morocco returned by the caravan from Akka to Tombuctoo, and from that place to Jinnee, where they arrived after an absence of three years and two months."

Such is the account of the negro travellers. Were we to adopt it without reflection or question, we should believe the identity of the Nile and Niger to be demonstrated. The powerful reasons taken from Ptolemy's Geography, and from the Arabian authors, for the total distinctness of the two rivers; the conclusions forced on us by the accounts collected by Browne, on the course of the rivers Misselad and Bahr-Kulla, (accounts confirmed by the information obtained by M. Seetzen;) and lastly, the extreme improbability of so long a course to any river as that of the Niger and Nile united, over countries which must differ considerably in elevation;—with some minds, all these arguments would not, perhaps, be sufficient to invalidate the evidence of these unknown negroes, who pretend to have actually seen objects, of which we only presume to form conjectures. Must we, on such data, overthrow *in toto* the maps of Ptolemy, D'Anville, and Rennel? remove the mountains to the east of Darfoor? make the Misselad and Bahr-Kulla run backward? We certainly do not yet think so. It appears to us, on the contrary, that the very account given by these pretended negro navigators, presents features which deprive it of any power of disturbing our old geographical creed.

First, These negroes were thrice forced to drag their boat along the land, because the Nile had not sufficient depth. Now, the Joliba, or Niger, is known to be a very large river near Tombuctoo. If it joins the Nile, it ought to gain an immense volume of water, and no canals of irrigation could run it dry. Besides, when once dried up, how does it all at once re-acquire its water?

The three cataracts mentioned may justly induce a suspicion of other interruptions in the course of the rivers navigated by the negroes.

Lastly, If this navigation had no insuperable obstacles to encounter, why should not the Soodan merchants prefer it to the laborious plan of accompanying the caravans across frightful and immense deserts? Mr. Jackson himself replies, because the route by land is more convenient and more expeditious.

This account of the negroes seems, therefore, to furnish only these three results: 1. That there are one or more rivers communicating between the Egyptian Nile and the Niger, in the same way as the Cassiquiari, in America, connects the Orinoco with the Amazons, and as in Norway, near Lesso, two rivers running north and south communicate with each other near their sources.

^e Jackson's Account of Morocco, last chapter. Annales des Voyages, XVIII. p. 340, &c.

The intermediate rivers are probably to the south-west of Darfoor.

2. A mountain chain coming from Afnoo, or from Kashna, joins that of Melli, and forms a large cataract to the west of Wangara; thus the western Soodan forms one or many basins with scarcely any outlet.

3. The existence of very large lakes in the south of Wangara, may induce a belief that the rivers of the central table-land have really no need of an outlet by the Gulf of Guinea.^a

Having exposed, with all the care and impartiality of which we are capable, the uncertainties which prevail respecting the courses of the rivers of central Africa, we shall endeavour to combine the most precise information contained in the accounts which we possess of the different countries, towns, and nations, of this vast region.

Mungo Park is the first to guide us in penetrating from the banks of the Senegal to those of the Niger. His first journey reaches only to Silla, between Sego and Jinnee: but he collected important information. He was the first European who saw the river Joliba, which is also called the Gulbi.^b The name Joliba signifies the great water. This river, when seen by the British traveller, had a gentle easterly course, glittering with the reflected beams of the rising sun, and was equal in breadth to the Thames at Westminster.

He soon after arrived at Sego, then the capital of Bambarra. This city, built on both sides of the river, consists of four quarters, surrounded by high clay walls. The houses are square and flat roofed, and made of clay; some two stories high, and generally white-washed. Several mosques are also to be seen. The number of inhabitants is estimated, perhaps rather too high, at 30,000. The king lives on the south bank. The inhabitants sail in canoes, which are formed of two large trees, scooped out, and joined at the two ends like the boats of the Foulahs. Immediately round the city there is a little culture, but the clay walls and rude canoes show the backward state of African civilization.

Park gives a description of the Moorish kingdom of Ludamar, where he was detained at Benown, and another called Beeroo, the capital of which is Walet. To the east of the latter lies the celebrated kingdom of Tombuctoo. To the south of these states are the negro kingdoms of Kaarta and Bambarra.

In Ludamar, Mr. Park learned, by a sherif who came from Walet with salt and some other commodities, that Houssa was the largest city he had ever seen, though Walet was larger than Tombuctoo. At Silla, some Moorish and negro merchants informed this traveller that two days' journey to the east was situated the city of Jinnee, on an island in the river; two days' journey beyond this city was found Dibbi, or the Black Lake, in crossing which from west to east the canoes are said to lose sight of land for a whole day. On leaving this lake the river divides into several streams, and ends in two branches which meet at Kabra, the port of Tombuctoo, which is a day's journey to the south of that city. At eleven days distance from Kabra, the river passes to the south of Houssa, which is two day's journey from the Joliba. All the natives with whom this traveller conversed seem to have been ignorant of the course

of this great river beyond that point, and of its mode of terminating. To the east of Houssa is the kingdom of Cassina. The king of Tombuctoo, whose name was Abu-Abrahima, was considered as rich, and his wives and concubines were dressed in silk. The kingdom of Houssa is of greater importance. To the south of the Niger are the kingdoms, or rather districts, of Gotto, and to the west of them Baedoo and Maniana; the inhabitants of the latter have the character of being cannibals. Such is the information given by Mr. Park.

With these particulars are naturally connected those of Mr. Jackson, obtained from oral communications, given by some inhabitants of Tombuctoo. Fifteen days' journey east from this city is found a vast lake called Bahar-Soodan, or the sea of Soodan, on the banks of which there lives a white nation, which in its language imitates, like the English, the whistling of birds; they ride saddled horses, and use spurs. Their face, all except the eyes, is covered with a turban. Armed with swords, bows, lances, and darts, they fight man to man. Their bodies, and those of their horses, are covered over with amulets. These people have decked vessels, forty cubits in length and eight in breadth, built of boards, which are united by twisted cords. These barks carry from one hundred and fifty to two hundred men, and a burden of twenty tons. They have no sails, and are put in motion by forty oars. These white people sail as far as Tombuctoo. In the year 1793 they extended their navigation to Jinnee, on the west of Tombuctoo; but were not allowed to trade. They are neither Moors, nor Arabs, nor Shillooks.^c

According to another passage, these white people, beyond the great lake, are called, by the Arabs, *N'sarrath Christian*, or Christian Nazarites. They are distinguished from a tribe of Jews who live on the frontier of Lemlem or Melly. This account acquires some importance when we compare it with the testimony of Edrisi, who expressly places the Jews in Lemlem,^d which Leo Africanus calls Melly, from the city of Malel.^e These Jews are very probably travelling merchants, known for a century back, on the slave coast, under the name of Maillys or Mallays;^f for, though circumcised, these merchants neither abstained from wine nor other strong liquors. They selected, and killed with their own hands, the animals whose flesh they ate. They came from a country to the north of Guinea, rich in gold, copper, and precious stones.

Mr. Jackson tells us that the city of Tombuctoo^g is situated in the midst of a plain, surrounded with sand hills, about twelve miles from the banks of the Nil-el-abeed, or the Nile of the Negroes, and nearly three days' journey from the frontiers of Zahara. It is unwall'd, and about twelve miles in circumference. It is frequented by all the negro nations, who exchange here the productions of their country for the manufactures of Europe and Barbary. The last sovereign of Morocco, Muley Ismael, had appointed a Moorish governor at Tombuctoo; but at present the city is dependent on the negro king of Bambarra, whose present residence is at Jinnee, the Ginnea of Leo Africanus, and the Genni of some other writers. The king has three palaces at Tombuctoo, which are said to contain an immense quantity of gold. This city is said to be kept under excellent police regulations; its industrious inhabitants,

^g *Tinbuctoo*.—Jackson.

who are chiefly negroes, are said to be strangers to theft, and emulous to copy the hospitality, elegance, and politeness of the Arabians.

The government never intermeddles with the different religions professed by the people who frequent Tombuctoo; but the Jews are excluded from it by the commercial jealousy of the Moors.

The government of the city is committed to a divan or council, composed of twelve *alemmas*.^a These magistrates, who are learned expounders of the Koran, are nominated by the king, and remain in office only three years. Mr. Jackson, who wishes to induce the English to engage in the Tombuctoo trade, by way of Mogadore, says that the library of that city contains Arabic, Hebrew, and Chaldaic manuscripts, among which are translations of the Greek and Latin authors.^b Other accounts maintain that the Tombuctans make use of characters different from those of the Hebrews and Arabians,^c which is denied by Mr. Jackson or his Moorish authority.

The climate is celebrated for salubrity, and the human constitution very soon arrives at maturity "It is said to be a rare thing to see a young man of eighteen who has not several lawful wives or concubine slaves, the Mahomedan law being here followed, and one who attains the age of twenty, without being married, is not thought respectable."

The Niger or Joliba overflows its banks when the sun enters the sign of Cancer. This is the rainy season. At Kabra the inundation becomes considerable. This wide and rapid river breeds crocodiles and hippopotami. The lands along the southern bank are covered with forests, where huge elephants feed under the shade of trees of extraordinary size and beauty. The soil round Tombuctoo produces rice, millet, Indian corn, and other grain. In the plains, the Arabs of the tribe of Brabesha cultivate wheat and barley. Coffee and indigo grow spontaneously. The latter is in some places cultivated, and produces a fine blue dye, which is employed in dyeing and printing the cotton goods. These fabrics are made at Jimnee and Tombuctoo with whimsical figures. They are used as bed-covers, and are much esteemed for the firmness of their texture, and are sold in Morocco at a high price. The breadth of the wove pieces varies two or three inches; they are sewed together, with thread or silk, so closely and neatly that the interstices are not seen. The cultivators, who are here called *fulah*,^d have a great talent for rearing bees; honey and wax are in great abundance, and large quantities are consumed by the inhabitants.

The gold mines, found to the south of the river, belong to the king, and their produce is deposited in his palaces at Tombuctoo. The people employed in working these mines are Bambarra negroes, who become very wealthy, as all the particles of gold under a certain weight (twelve mizans) belong to them. So very rich are these mines, that pieces of pure gold weighing several ounces are said to be frequently found. It is no wonder then that this precious metal is so little prized at Tombuctoo, and that objects which are of so little value among Europeans, such as

salt, tobacco, and wrought copper, are here exchanged for their weight in gold.

The remainder of western Nigritia was, in the time of Edrisi, divided into two kingdoms, that of Tocroor, and that of Gana. In the first of these, where the people lived on *dourra*, milk, and fish, (an evidence of a moderate fertility of territory,) were found the city of Tocroor, then the centre of the trade of Nigritia, also Berissa, and Sala. The capital of the state of Gana, bearing the same name, was situated on a large fresh-water lake, and was built of chalk. It was the Ta-Gana of Ptolemy, and the Cano of Leo Africanus. This was probably a flourishing empire in the fifteenth century, for, according to Barros, the ambassadors of the king of Benin said to John II. king of Portugal, that "the kingdom of Benin was in some measure in a state of vassalage to a powerful prince in the interior, called Ogane, who was venerated as great pontiff."^e

At present Houssa is mentioned in the situation assigned to Tocroor, and the state of Kashna occupies the place of Gana; but both of them are among the least known countries of Nigritia. With some, Houssa is an immense city; with others, it is the name of a very populous territory, where the economical arts have arrived at high perfection, excellent steel files being in the number of their articles of manufacture.^f The kingdom of Kassena, or Kashna, is known to us only from the accounts of the Tripolitans and Fezzanese. This country, bounding with the territories of Bornoo and Fezzan, seems to be properly called Afnoo,^g and is known by the name of Affanoh, in the capital of Bornoo.^h The chief city, to which the name of Kashna seems more particularly to belong, is five days' journey to the north of the Niger,ⁱ on the road from Fezzan to Zamphra, another large city, which is also represented as the seat of a sultan. On the way to Kashna is Agadez, the chief town of an oâsis, inhabited by the Tuaricks. The vine does not grow so well, nor does the camel thrive equally well, to the west and south of Kashna. The chief productions of the country are gold dust, cotton, a particular kind of rice called *bishna*, numerous monkeys and paroquets. Dressed goat skins, ox-hides, zibet, and musk, are exported.^k The surface is extremely mountainous. On this account, in our map of northern Africa, we place the cataracts of the Niger between the kingdoms of Melli and Kashna.

It is certain that Nigritia is naturally divided into several basins, or table-lands, differing in elevation. According to Leo Africanus, there are districts in the interior where the cold obliges the inhabitants to use fire for part of the year. "At Gago the vines are unable to stand the cold, while the vicinity of Gana is covered with cotton shrubs, and orange trees."^j

Eastern Nigritia contains two countries which are better known than the rest, Darfoor and Bornoo. The first, which was imperfectly known to Leo and Wansleb, has been visited and described by Mr. Browne. An inhabitant of that country, of the name of Mohammed, whom M.

Seetzen met with at Cairo, has also given some curious information respecting it. The *dgelabee* or merchants, after leaving Cairo, first stop at Sioot, and then cross a wide desert, containing a small number of cultivated *oases*. At the end of five days after leaving Sioot, they reach Kargeh, the capital of the Great Oâsis. From this place they take two days to reach Beris, six more to Sheupp, three from thence to Selim, five to Legghyeh, and six to Bir-el-Attroon, and, lastly, ten days to Darfoor, making in all a journey of thirty-seven days.^a

Darfoor^b is watered by the river Bahr-Attaba, which is said to flow into the Nile, and is navigated by small craft. This river, according to the map of Mr. Browne, can only fall into the Misselad, as a mountain chain extends along the east side of the country. Darfoor contains iron, and a copper ore which gives an excellent red colour.^c According to Browne, the copper is bought near the sources of the Abiad. The quarries yield marble, alabaster, granite, fossil salt, and nitre. It labours, however, under a want both of lime and building stone. According to Mohammed's account, snow falls every year, but melts as soon as it touches the ground. One of the largest mountains of the country is called Marra.

The rains begin in the middle of June, and last till the middle of September. The whole aspect of the country is at that time changed, the character of utter sterility being replaced by a pleasing verdure. When the rainy season begins, the proprietors of the land go to their fields with such labourers as they are able to collect. They make holes in the ground, at distances of two feet, where they sow the millet seed, and cover it over with their feet, and thus terminate the labours of seed time. The crop of millet is harvested in the course of two months: wheat requires three. Rice grows spontaneously, and so abundantly that it is little valued, though of superior quality. Dourra and millet are greatly cultivated in Darfoor, but wheat is neglected. Dates are abundant; and, like wheat, are used for the preparation of a spirituous liquor. According to Browne, the vegetation is not greatly diversified, and is chiefly remarkable for the thorny and hard nature of the wood, consisting of the tamarind, the plane, the sycamore, the *nebbek*, and several others, which are mentioned, and briefly described by this traveller; but the tamarind is the only tree the fruit of which is well worth gathering; for even the date bears a small and tasteless fruit. Tobacco seems to be an indigenous production in some parts.

Mr. Brown, who scarcely went out of the capital, represents the animals as few in number, consisting only of well known species. Mohammed says that the mountains and forests abound with game. He mentions different sorts of gazelles, wild boars, buffaloes, and apparently a sort of deer with which we are not acquainted.^d Darfoor contains the elephant and the rhinoceros, and numerous giraffes, which are called *ourr*, in the language of the country.

The skins of elephants, rhinoceroses, and hippopotami, are used for making whips, which are sold in great numbers at Cairo. Bees and honey are in abundance.

The Darfoorians, who ought to be called Foorians,^e have, according to Mr. Browne's observations, very thick, coarse

skins, but not particularly black. They are brawny and muscular. Their eyesight is excellent. There are few bear-eyed persons^f among them, and none blind. Their teeth are white and durable, being generally entire till a very advanced age. The Darfoor negroes differ in features from those of Guinea; but their hair is generally short and woolly. They are cowardly, dirty, thievish, and deceitful. They are patient of hunger and thirst. They use no baths, but apply a greasy paste to their skin. Commerce is conducted by barter, money being unknown. Polygamy is carried to great extravagance, and the intercourse of the sexes subjected to little regulation. Circumcision and excision are practised among them. They seem to use the Berber language, but understand Arabic. According to Mohammed, all the inhabitants of the country profess the Mahometan faith. They have the Alkoran, and many among them have their children taught to read that work, and to write in Arabic. This language is exclusively used for epistolary correspondence, which, however, is very rare among them. With the exception of the name of the Deity, all the terms used for metaphysical objects, as well as the generality of those which are connected with political offices and arrangements, are borrowed from the Arabic. The government is despotic. The sultan or sovereign engages in trade, levies duties on all the goods, and is furnished annually with a quantity of millet, from every village, which is collected by his slaves. According to Browne, there are no more than twelve towns in the whole of Darfoor, and each of these contains no more than 5000 or 6000 inhabitants. Cobbe, the metropolis, is more than two miles long, but very narrow, and its population does not exceed 6000. Mohammed calls the sultan's place of residence Tandely, and gives the names of more than fifty towns.

A great desert, called Dar-Kab, separates Darfoor from Kordofan. Mohammed mentions a very interesting country to the south-east, the empire of the Shillooks, which lies west from Abyssinia, and twenty days' journey south from Darfoor. Their sultan is one of the most powerful among the negro princes. The territory is very mountainous, and watered by a great number of rivers, among which Mohammed mentions the Bahr-el-Abiad, Bahr-Indry, Bahr-el-Harras, and Bahr-Esrak, all of which take their rise in the country of the Shillooks, and afterwards join the Egyptian Nile. The Bahr-el-Abiad is the great western branch of the Nile, and its origin should be considered as the source of the Nile, which Father Lobo and Mr. Bruce wished to find in Abyssinia. The Shillooks are negroes and idolaters, and go quite naked. Their only arms are the bow, the arrow, and the lance. The Bahr-el-Abiad passes through the middle of their country. The largest mountains are the Djibbel-el-Djinse, and the Djibbel-el-Temmaroo, which are frequently covered with snow. They form apparently a part of the Mountains of the Moon. The Shillooks are constantly at war with the Abyssinians, but maintain commercial relations with the people of Darfoor; and the traders of the two nations often visit one another. By washing the sand of the rivers they obtain gold, which is kept in the quill-tubes of a huge bird, called in Egypt the *sakgar*, and in Darfoor the *doulh*. This bird,

white like silver, softer, and less brittle.—*Ed. Encyc.* The red ore is probably the red oxyd.—P.

^e Furians.

^f "Myopes," short-sighted, or with defective sight.

which is probably a sort of condor, possesses immense strength, and even attacks and kills asses. Giraffes are also found here in abundance.

Mohammed himself had visited this country. The capital city and residence of the sultan is called Bahr-el-Abiad, being situated on the river of that name. He says that it is a commercial place, and contains a great number of remarkable buildings, but he is not quite consistent in his accounts.

Another and better informed negro described to M. Sætzten the Dar-el-Abiad^a as a large hilly country, full of rivers, and inhabited by real savages. The name seems to point it out as the country which gives rise to the Bahr-el-Abiad, and where, in the rainy season, it probably communicates with the rivers which join the Niger.

The information furnished by Mr. Browne applies to a direction somewhat different, viz. the south-west.

At a distance of three days' journey to the south of Cobbe, there are copper mines; and seven days' journey and a half beyond these is the Bahr-el-Abiad. To the west of this is the river Koollah,^b the banks of which, according to the information of Mr. Browne, abound with pimento trees. The boats are forced along by poles and two oars each. Large are the trees, that one of them may be scooped out into a canoe fit to carry ten people. The natives of Koollah are partly black and partly red or copper coloured. The country is chiefly frequented by the djelaby or merchants of Bergoo and Darfoor, who come hither to buy slaves, the slightest offence being here punished by the sale of the delinquent to foreign merchants.

To the west of Darfoor, is a country which the natives call Mobba, the Arabs Bar-szeleh, and the Foorians Dar-Bergoo, known to us from the reports of two natives,^c who agree on most of the facts. Mobba is to the west of Darfoor, and to the south-east of Bornoo. Vara, the capital, is thrice as large as Bulak. The town itself contains many earthen houses, but in the neighbourhood, conical cabins, made of reeds and canes, are the only habitations.

The sultan's seraglio is an immense brick building, and contains the only mosque belonging to the place, which is kept constantly lighted with lamps. The country is full of mountains and valleys. "There are no rivers, properly so called," says one of the native reporters, "but rain torrents, which, when dried up, leave considerable lakes or pools. The largest of these torrents is between Mobba and Bagirma, and is called Bahr-el-Zafal." The other native says, "that at three days' distance west from the city, there is a large river, running from south to north, broader than the Nile, and, like this last, subject to periodical inundations, and called in the Mobba language Engy," (their word for water.)

The Mobba country produces soda, which is exported to Cairo; rock salt of different colours; and another salt not accurately known. Two sorts of iron ore are found in the beds of the torrents, one in the form of sand, the other in that of a stone, and from which knives and needles are manufactured. There are no other metallic substances. Limestone is rare. But this country is covered with trees, among which are different sorts of sycamores,

palms, and the *Acacia vera*. Every kind of poultry is found here, as fowls, pigeons, wild geese. There are also many bees, scorpions, and locusts, the last of which are used as food. There are plenty of horses, dogs, cats, buffaloes, and gazelles. The large ponds created by the rain water harbour numbers of crocodiles.

The rainy season lasts seven or eight months. The dry season consequently only four or five. Ice is unknown; snow and hail are very rare. The chief culture is that of dourra and millet. There is neither wheat, barley, nor pulse.^d Cotton is abundant; rice is grown every where, and the gummy acacias are frequent.

Most of the inhabitants are Mahometan negroes, some of whom have learned to read and write the Arabic language. The children of both sexes are circumcised. The women go unveiled. The arms of these negroes consist of sabres, lances, bows and arrows, and bucklers. The few muskets which they have come from Cairo, as well as lead, gunpowder, and cuirasses. The plague is very rare in this country; but the small-pox produces great ravages; and diseases attached to libidinous conduct are very common.^e

To the west of Mobba, all our accounts agree in placing Baghirmah,^f a state now dependent on the powerful mussulman emperor of Bornoo, as is shown by the following anecdote, related by Hassan, an inhabitant of Mobba.

The sultan of Baghirmah had married his own sister, an action so contrary to the law could not remain concealed, but came to the knowledge of the sultan of Bornoo, who, in a paroxysm of wrath, ordered him instantly to relinquish that incestuous connection, under the penalty of the vengeance of Allah and the emperor. The sultan of Baghirmah not suffering himself to be intimidated, sent back the sultan's letter, writing on the back for an answer, "that the custom of marrying a sister had existed long before the prophet, and that he saw no reason why it should not exist after him." An answer so laconic from a dependent raised the emperor's passion to madness. He immediately ordered the vassal sultan of Mobba to enter the Baghirmah country with an invading force, a commission which the latter prince executed, and having vanquished the rebel sultan, sent him prisoner to Mobba. Hassan did not know the subsequent fate of that prince; but the Baghirmah country had been for four years^g attached to the territories of Mobba.

It is very probable that, at the beginning of the eighteenth century, the sultan of Baghirmah ruled over the adjoining countries, including Bornoo, for his place of residence is called Karna; but according to the accounts collected by Father Sicard; the city of Karneh, situated on a great river communicating with the Nile of Egypt, was the capital of the state of Bornoo.^h The river was called Bahr-el-Gazal, and the canal of communication between the Niger and Nile, says Sicard, is the Bahr-el-Azurak.

Other accounts make the Baghirmah country contain some inhabitants professing the Christian religion,ⁱ coinciding with the negro tradition, which states, that to the east of Houssa, beyond a great lake, there is a nation of Naza-

renes. The inhabitants of the country of Andam also pass for Christians, and are said to have pointed teeth. The same shape of the teeth is common among the Jemjens, who are pagans and cannibals. The Kendil nation has long hair.

Wangara, or Vankara,^a a marshy country, surrounded either by different rivers, or different branches of one great river, and rich in gold dust, is surnamed, in Arabic, Belad-el-Tibr, or the Country of Pure Gold, and is still less known to us than the preceding countries. Here Edrisi places among other cities those of Ragbil and Semegonda, on the borders of a fresh water sea; but luckily for those who are fond of disputes, the Arabic term, which is translated sea, also signifies a great river.^b

We shall conclude our account of Nigritia with a description of the empire of Bornoo,^c respecting which M. Seetzen has collected some interesting information from a native.^d This state seems at the present moment to comprehend several kingdoms once independent. We have just seen that the princes of Mobba and Baghirmah depend on it. Among other vassal countries, we hear of Phallateh, which is inhabited by a colony of Senegal Foulahs or Fellahs; the Kotkoo, who seem to be the Kookoo of Edrisi; Kanem, in which the city of Matsan seems to correspond to that of Mathan, which at one time was its capital, or rather the residence of a prince who for a short interval ruled over these countries.^e The Bornese pretend even that Fezzan, Afnoo, Kishena, probably Kashna, Darfoor, and even Sennaar, acknowledge the supremacy of their emperor.

The eastern part of the territory of the empire of Bornoo contains some mountains. About three miles from the capital, there is a river, called Halem, as large as the Nile, on which there is a number of vessels with sails and oars formed of planks, fastened with iron nails. Abdallah could not inform M. Seetzen either of the source or the termination of this river, but he assured him that it ran from south to north, and that it overflowed its banks in the rainy season like the Nile. If we consider this account as correct, we must give the river of Bornoo a direction opposite to that given it in our maps. In the towns of Bornoo well water is commonly used, and is said to be of excellent quality.

The soil consists of a soft sand, which renders the shoeing of horses in this country unnecessary, but without irrigation it cannot be made productive. Along the side of the river, black chalk^f is found; there is likewise some pyrites and potters' clay. According to the Tripolitan Abderrahman-Aga, the sultan receives from the mining operations immense quantities of gold.^g Leo Africanus asserts that, at the court of Bornoo, the stirrups, spurs, dining plates, and even the chains of the hunting dogs, were of pure gold.^h But the native Abdallah says, that no ore of gold, silver, or copper, has been discovered, though there are some iron mines now worked. These testimonies may, however, be reconciled. The gold, though unknown as a product of Bornoo Proper, may

come from Wangara, one of its dependencies. The merchants of the province of Affanoh bring rock salt, which has a slight degree of bitterness. A good salt is extracted from the ashes of a thorny plant by lixiviation. A very distant desert produces two varieties of soda, one white, and the other red.

The vegetable kingdom is very rich, containing abundance of fruit trees, and forests of wild timber. Date palms are in abundance. According to Abdallah, there are no citrons nor pomegranates, though other accounts mention these among the trees of the country. The *szoolidih* surpasses all other trees in height and thickness. Its fruit is not an article of food, but yields an oil which is employed as a medicine.

The country produces grain, but none of the leguminous species cultivated in Egypt. Rice comes up spontaneously in great abundance after rains; for, says Abdallah, there is much rain in that country, from which, and from the action of the cold, men often die!ⁱ The sugar cane is there unknown. The bitter *Ngoro* nut, perhaps the areca, comes from Kanem and from Affanoh.

Bornoo possesses all the domestic animals of Egypt. The forests contain a great quantity of monkeys. Abdallah told M. Seetzen that women were particularly exposed to annoyance from these animals, on which account they never go through the forests except in large parties. Numerous giraffes browse the leaves and young branches of the trees. Lions inhabit the deserts. The skin of the hippopotamus is used for making whips, and his tallow for candles. Tapers are made from wax. The horns of the *glembo*, which seems to be a wild goat,^k furnish war trumpets. The rivers swarm with crocodiles. Ostrich feathers form an article of trade. The *matzakweh*, called the king of birds on account of the incomparable beauty of his variegated plumage; the *adgunon*, the largest bird with the exception of the ostrich, which, however, is always afraid of it; and, lastly, the *knilodan*, a carnivorous quadruped stronger than the lion or the tiger, are animals which still remain to be subjected to authentic and scientific examination.

Locusts fly in numerous swarms: they are of two kinds, one of which is fried with butter in a pot, and used as food. There is abundance of wild honey in the trunks of the trees. The guinea-worm, *Vena medinensis*, is very common; it appears in every part of the body.

According to the inhabitants of Mobba, the capital is called Akumbo. It has also the name of Birni, in the language of the country. "I have always heard people speak of Cairo and Grand Cairo," says Abdallah, "but it is *harra* (a trifle) in comparison of Bornoo." He says, "that a person could not go from one end of it to another in a day. If a child should lose itself in the city, it loses its parents for ever, as it is impossible to find them again." This description is, to a certain extent, confirmed by other testimonies. The Tripolitans allow that Bornoo or Barni has 10,000 houses, and is much larger than the capital of their country.^m Bornoo has a great number of gates and thick

walls built of stones and mud, and provided with steps on the inside. The mosques are adorned with very high towers. The dwellings of the grandees and the rich are built in a very solid manner of stone, in a similar style to the houses of Cairo, but higher. The great mosque contains the principal school, which Abdallah compared to the academy in the mosque of El-Ashar at Cairo; that, besides the Koran, there are several books of science for the use of the numerous scholars, who learn there to read, to write, and to calculate. The paper which is wanted is brought from Egypt, Tripoli, and Tunis. The students are supported at the sultan's expense.

The reigning dynasty, in the time of Leo Africanus, was of the Arab or Berber tribe of Berdoa. The same family seems still in possession of the throne; for, according to Abdallah, "the sultan is not black, but of a deep brown. He never eats bread, but only rice, being persuaded, by virtue of an old prophecy, that the use of bread would be the cause of his death." The government is only hereditary in the male line. The sultan keeps four lawful wives, who are natives of Bornoo, and a crowd of female slaves.

In the time of Leo, the Bornese, living without any positive religion, or at least without any form of worship, had their wives and children in common.^a They now profess the Mahometan religion, and circumcision in both sexes is the universal law. There are also some free Christians, who keep certain holidays, but have no church. The country contains no Jews. Negroes and Abyssinian

^a Léon, p. 656.

^b The recent travels of Denham and Clapperton have contributed more to settle the geography of central Africa, than all which had preceded them. They crossed the desert of the Tibboos from Fezzan to the N. shores of Lake Tsad in about 14° N.; then advanced along the W. shores of the lake, and crossed the Yeou, a large river from the westward, after which they arrived at Kouka, the residence of the sheikh of Bornou. From this point they made excursions, S. to the mountains south of Mandara in about 9° N.,—E. to the Shary, a large river flowing from the S. into Lake Tsad, and along the S. shores of the lake eastward,—and W. to Sackatoo, the capital of Soudan. These excursions enabled them to ascertain the position and present state of two of the most powerful kingdoms in central Africa. That of Bornou lies along the W. and S. W. shores of Lake Tsad, and extends W. towards the Fellata territories. It is bounded N. by part of Kanem and the desert, S. E. by the Shary, which divides it from Begharmi, S. by the kingdom of Mandara, and W. by Soudan. The native Bornouese are Negroes, but there are tribes of Arabs scattered over the country. This kingdom was recently overrun by the Fellatas, but the present sheikh, originally a *fighi* (teacher) in Fezzan, drove them out by the aid of the Kanemboos, and has now established a power second to none but the Fellatas in central Africa. He restored the former family of sultans, and has only retained the title of sheikh. He professes to rule in the name of the sultan, although his power is absolute, and that of the sultan merely a shadow. The principal towns in Bornou, are Kouka, the residence of the sheikh, in lat. 12° 51' N. long. 13° 47' E., nearly on the meridian of Mourzouk; New Birnie, the residence of the sultan; and Angornou, a large trading town, near the lake, S. E. of Kouka. Old

slaves are numerous. A very effectual method is practised for converting them to the Mahometan religion; which is to beat them till they learn to repeat the creed, "There is no God but God, and Mahomet is his prophet." This profession once uttered concludes the business. Several negro slaves brought from the Banda country have the teeth much pointed; the wounds which they inflict in biting are difficult to heal; and their masters take the precaution of blunting them with a file.

M. Seetzen was much surprised to learn, that the Sultan of Bornoo had many French slaves, some of whom even preserved their European dress. They have established for him a foundery for brass cannon, which he uses in his wars with the pagan negroes to the south of the empire.—We are almost tempted to conceive a suspicion, that this Sultan follows, in regard to European travellers, the policy of the government of Habesh, which we know puts every possible obstacle in the way of their return to their own country; so that it is not impossible that intelligence may yet be received of Mr. Hornemann.

The trade of Bornoo is very active, and always brings to it a multitude of foreign merchants. The chief business is transacted by the Tunisians; but the Tripolitans, the Egyptians, the Fezzanese, and the Affanoh negroes, bring a large quantity of goods. Rings of gold, silver, and brass, are manufactured in Bornoo; also needles, coverlids, and various stuffs. There are some lapidaries acquainted with the art of polishing and cutting stones, and engraving seals.^b

Birnie, the former residence of the sultans, on the Yeou, was destroyed by the Fellatas. Lake Tsad is a very extensive body of fresh water, reaching between 200 and 300 miles from N. to S. but its eastern boundary is not determined. It receives the Yeou from the W. which rises in the granite mountains of Soudan, and is not the Niger, and the Shary from the S. It is not known whether it has an outlet, or whether it communicates with the Nile or Niger.

West of Bornou is the kingdom of Soudan. It extends S. E. to the mountains S. of Mandara, and W. to the Kowara or Niger. Its capital is Sackatoo, a large and populous city, although founded in 1505. It is in lat. 13° 4' 52" N. long. 6° 12' E. on a branch of the Kowara. The sultan Bello is represented as a learned and an intelligent man. Kano, in lat. 12° N. long. 9° 20' E., is the great emporium of Haussa, (the E. part of Soudan,) and is frequented by Moorish merchants, who bring many articles of European merchandize. Clapperton purchased there an English green cotton umbrella. Kashna, (12° 59' N.) the former emporium of Haussa, is now mostly in ruins. The Fellatas are a copper coloured race, speaking a peculiar language, and extending from Djinnie E. to Bornou. They are not negroes, but are said to resemble the Moors. They are the ruling people in Soudan, and were but recently driven out of Bornou, which they had conquered.

The country round the shores of Lake Tsad is low and sandy, or marshy. Most of Bornou is level and sandy; but Mandara, to the S., and Haussa, to the W., are hilly and mountainous. The central ridge is granite, skirted by sandstone. These discoveries have not settled the course of the Niger, but have rendered it highly probable that it flows into the Gulf of Benin.—P.

BOOK LXVIII.

ON THE INHABITANTS OF NIGRITIA, SENEGAMBIA, AND GUINEA.

THE numerous black nations on the north of the equator, whose countries we have surveyed, in so far as the present state of our knowledge permitted, present the historian, in the great outline of their manners, with a vast subject of meditation.

The physical properties of the country perpetuate in all those nations that indolent levity, and childish carelessness, which seem innate qualities of the negro race. Twenty days of work in a year are sufficient, in most of these countries, to secure the crops of rice, millet, maize, yams, and manioc, that are required for his frugal repast. His gross taste gives him every where the readiest resources. The flesh of the elephant, even when full of vermin, does not prove repulsive to his sturdy stomach.^a He is fond of the crocodile's eggs, and even of its musky flesh. The monkeys are very generally used as food.^b Even dead dogs and putrid fish give no disgust. Roasted dogs even figure as an exquisite treat at their great feasts. But the negro rejects sallad, because he will not so far imitate the herbivorous animals.^c The preparation of thick, juicy, and well seasoned soups, which compose his cookery, requires very little care. An easy manufacture gives him his palm, or banana wine, and his millet-beer, which form his ordinary drink. Europe furnishes the negroes of the sea coast with those pernicious spirituous liquors which make them pass at once from a state of intoxication to a state of slavery. Little labour is required in providing for their dress. The cotton grows at their feet without culture. From this the females prepare the stuffs necessary for their families, and dye them with indigo, a production likewise spontaneous. The negro's cabin costs equally little care. Some trunks of trees, scarcely chipped, or in any way shaped, some branches stripped of their bark, a little straw, or a few palm leaves, are his whole materials; to connect them in the form of a cone, is the amount of the art which he requires. This simple architecture is dictated to him by the climate and the violence of the annual rains. It is only on the Gold Coast, or on the banks of the Niger, that the example of the Europeans and the Moors, has taught the negro, that a flat roof, if solid, may be made proof against rain.

The towns are only great collections of such cottages. There are no public buildings, even among the tribes which live under a sort of republican government. The most that they ever have is a large shed, open on all sides, called a *boorree*, for conducting their public deliberations, denomi-

nated, from a corruption of a Portuguese term,^d the *palaver*.^e The palaces of their chiefs are only distinguished by the great number of cottages of which they consist.—The furniture of the poorer sort is often confined to two or three calabashes; the rich have some fire-arms to show off; the sovereigns, who adorn their dwellings with human skulls, and jaw-bones, have stone-ware,^f and carpeting of European manufacture. But these monarchs, whose distinguishing pomp consists in walking in slippers, under the shade of an umbrella, have sometimes a piece of massive gold for a throne.

Mr. Isert had remarked, as a strong proof of the indolence of the negro, that he has never tamed the elephant, an animal so common in Africa, and so capable of becoming the useful and intelligent auxiliary of man. The inhabitants of Begombah, an unknown country in the interior of Guinea, are said to have made some attempts to employ the elephant. The negro in general is not a courageous hunter, nor does he cause his dominion to be felt among the numerous wild animals which share with him his fertile country. He is more active, more skilful, and more successful, in fishing. Both by swimming and by rowing, he braves the stormy waters, and carries home his nets loaded with immense booty. But he quickly relapses into his habitual indolence, and the very abundance of this resource proves an obstacle to the development of his natural talent, for the pursuit of industry.^g The existence of this talent is shown in the fabrication of stuffs, coverlids, sails for vessels, pottery, tobacco pipes, and wooden utensils, manufactures which are very general among this people. We are informed that even at Bambarra, Tombuctoo, and Bornoo, the art of weaving is carried to considerable perfection. The talent of the negroes is also remarkable in the skill of their blacksmiths and goldsmiths, who with a few rude instruments, make swords, axes, knives, golden braids, and many other articles. They can also give steel a good temper,^h and reduce gold wire to a great degree of fineness.ⁱ The precious stones are cut among the people of Whidah.^k

All this industry, indeed, is contracted by the paucity of wants, and the best negro artizan never thinks of working more than is requisite for earning his daily subsistence. Strangers to our feelings of avarice and ambition, the Africans consider life as a brief interval, which it is incumbent on them to enjoy to the utmost. They wait for sunset to begin the giddy dance, which they keep up the

whole night, animated by the hoarse sounds of the ivory trumpet, and the beating of drums, mingled with the cadence of various guitars and harps. Young and old, all take their part in the nightly festivity. From one village the sound of their songs and concerts is passed responsive to another. These pastoral scenes will not surprise those who have read the English verses written by some emancipated negroes, which are far from being deficient in sentiment and fancy. Gaming has charms in the eyes of the African more potent than those of the dance. But the ingenious combinations of the *oori*, more varied than our game of draughts, only interest the women, while the men court the violent mental agitation attending on games of blind chance, with as much keenness as we find prevailing among many young persons of fashion in Europe.

The negroes, amidst all the varieties of their colour and conformation, seldom labour under bodily defects. Their health is kept up by a simple style of living, exercise, and perspiration; and among some negro nations, if not all, infants born with any defect are destroyed.^a The negroes do not seem to have inherited the privilege of the ancient Macrobian. The length of their lives, at least in Senegambia and at Sierra Leone, is not equal to ours.^b Instances of longevity are very common among the negroes transported to the colonies,^c which must belong to some tribes more favoured by nature. Fevers, diarrhoea, small-pox, leprosy, a variety of syphilis, called the *pian*, and the Guinea worm, are the most common scourges of the life of the negro.

The thin beard of the negroes partakes of the woolly character of their hair, yet in pruriency of temperament, and fecundity of population, they excel all other races of mankind; and polygamy is carried to a greater excess among them than in any other part of the world.

There are some nations which give their teeth a pointed shape by filing. But Isert asserts that he has seen some negroes whose fore teeth were naturally so formed. Some among them boast of being cannibals, and, to prove the fact, bite off a piece of flesh from the arm of a bystander.^d

The practice of making incisions in the skin prevails, in various forms and degrees, among all the negro nations which have preserved their primitive character. The Mandingos have vertical cuts over their whole body.^e The same sort of mark is found among the Akras, the Watiehs, the Tamboos, the Mokokos, and the Eyeos of Guinea,^f and among the inhabitants of Bornoo, Darfoor, and Mobba;^g but the situation and number of these incisions vary. The people of Darfoor are marked in the face and the back, those of Mobba in the neck.^h The Mokokos mark their bodies on the stomach with figures of trees and foilage. The Calabarsⁱ mark their foreheads with cuts in a horizontal direction, the Sokkos with two crossed lines. The Subaloas^k cover the cheeks and the whole body with curved lines, crossing one another.^l The Mangrees mark themselves under the eyes with a figure resembling the letter V inverted. Some tribes near Sierra Leone have the art of making their skin rise in elevated marks like basso relievos.^m

Circumcision is detested by the Foulahs, but becomes a religious observance among the Mandingos, who extend it to both sexes,ⁿ and is also practised by some negro nations of idolaters, such as the Akras on the Gold Coast, the Dahomeys, the Mokokos, the Watiehs, the Calabars, and the Ibbos.^o In Benin the females are mutilated, while the Dahomeys, like the Hottentots, resort to the unseemly practice of producing by artificial means a sort of apron by the elongation of the skin in front of the body.^p

Any thing that strikes the irregular imagination of the negro becomes his *fetish*, or the idol of his worship. He adores, and in difficulties consults a tree, a rock, an egg, a fish-bone, a date-stone, a horn, or a blade of grass. Some tribes have one *fetish*, which is national and supreme. The following instance of the power of superstition, and the address with which it was turned to account by an enemy, is mentioned in the work of M. Mollien. M. Ribet, within the present century, at the head of twenty-five European soldiers, and 400 Senegal negroes, had, in an act of reprisal, plundered all the Foulah villages on the river side. On arriving at Gaet, a large town, no person appeared to oppose them: the inhabitants were all concealed behind their palisades, and thus entrenched fired on the enemy. Two field-pieces, in the mean time, by which M. Ribet was accompanied, made incredible havoc among the Foulahs; but at the moment when he thought victory certain, a bull, which they had kept for the purpose, leaped over the palisades, and furiously rushed upon his men. A divinity descending from heaven could not have produced a more extraordinary effect. The negroes of the Senegal, persuaded that their lives depended on that of the bull, stopped the French soldiers ready to fire at him, exclaiming, that if he were slain all sorts of misfortunes would overwhelm them. The stratagem was completely successful. The negroes dispersed, and fled in disorder to the vessels, while the twenty-five Europeans, disdainful to run away, fell victims to their bravery. In Whidah a serpent is regarded as the god of war, of trade, of agriculture, and of fertility. It is kept in a species of temple, and attended by an order of priests. Some young women are consecrated to it, whose business it is to please the deity with their wanton dances, and who are in fact a sort of concubines to the priests. Every new king brings rich presents to the serpent.^q In Benin, a lizard is the object of public worship; in Dahomey, a leopard. In the neighbourhood of Cape Mesurado, the offerings of the people are presented to a more beneficent deity, the sun.^r Some negroes fashion their fetishes into an imitation of the human form. They seem in general to believe in two ruling principles; one of good, and the other of evil.^s

In their funerals, which are attended with much howling and singing, a very singular piece of superstition prevails. The bearers of the body ask the deceased, if he has been poisoned or enchanted, and pretend to receive a reply by a motion of the coffin which is no doubt produced by one of their boldest jugglers. The person whom the deceased accuses of having killed him by enchantment is at once condemned to be sold for a slave. The interments of

princes occasion scenes of a much more deplorable nature. The blood of numerous human victims is shed on the royal tomb. That custom prevails among the Aminas, the Dahomeys, the Beninese, the Ibbos, and perhaps many other nations.^a

Yet despotism is not the only or the chief misfortune of Africa. The states of Benin and Dahomey, the Yolofs and the Foulahs, enjoy at least internal tranquility under their almost absolute monarchs; while in Bambook, around Sierra Leone, and on the Gold Coast, the principal village chiefs form, in conjunction with an elective monarchy, turbulent and disastrous aristocracies. As the authority of each increases in proportion to the quantity of gold and the number of slaves which he possesses, the people of distinction^b eagerly exert themselves to become rich by laying waste the villages of their rivals. Hence those perpetual petty wars which desolate almost all the negro countries, and which have for their leading object, the capture of a number of unfortunate beings who are sold to the Europeans. The laws, preserved only in the memories of the people, punish all disorder with severity; but in a state which is a prey to anarchy, the execution of them is precarious, and the absolute chiefs apply them to the cruel purpose of increasing their stock of slaves. In general, the most trifling theft is visited with this doom. Private individuals who sue for a debt, have on the other hand the greatest difficulty to obtain their due right. Pleaders of a bullying and intriguing character display an astonishing degree of art at the *palavers*, or judicial assemblies. A merchant who cannot obtain justice, often pays himself by causing the children or relations of a dishonest debtor to be carried off and sold as slaves.^c

It would be for the interest of Africa were the great empires of Bornoo, Houssa, and Bambarra, consolidated. They might then become the foci of a civilization, at least as far advanced as we find that of Asia. Unfortunately, the state of the country seems destitute of any elements of stability. The changes of the capital of Bornoo, which have created so many uncertainties among geographers, probably arise from the circumstance, that out of a number of hereditary sultans, each master of a single province, sometimes one, sometimes another, attains, by election or by conquest, the exercise of the supreme power. There are two causes, in particular, which contribute to prevent Nigritia from attaining a stable condition. One is the vicinity of the Moors, a restless race, addicted to plunder, and ill capable either of founding or establishing an empire;^d the other is the vast number of nomadic tribes of Arabs, who, protected by their state of pastoral poverty, defy even the authority of the potent monarchs of Bornoo.^e

The pride of the petty lords of Africa is equal to their barbarous and disgusting ferocity. While we shudder to see them seated on their thrones of gold, surrounded by human skulls, we must smile on hearing the pompous language of princes, whose largest armies scarcely amount to 10,000 men.

The Danes have furnished us with a portrait of the king of the Ashantees, whose name is Opocoo. This monarch was seated on a throne of massive gold under the shade of an artificial tree with golden leaves. His body, extremely lean, and inordinately tall, was smeared over with tallow,

sprinkled with gold dust. A European hat bound with broad gold lace, covered his head; his loins were encircled with a sash of golden cloth. From his neck down to his feet, cornelians, agates, and lazulites, were crowded in the form of bracelets and chains, and his feet rested in a golden bason. The grandees of the realm lay prostrate on the ground, with their heads covered with dust. A hundred complainers and accused persons were in a similar posture; behind them twenty executioners, with drawn sabres in their hands, waited the royal signal, which generally terminated each cause, by the decapitation of one or other of the parties. The Danish envoy, passing a number of bloody heads, recently separated from the body, approached the throne. The magnificent flaming prince addressed him with the following most gracious questions:—"I would willingly detain thee for some months in my dominions, to give you an idea of my greatness.—Hast thou ever seen any thing to be compared with it?"—"No! lord and king, thou hast no equal in the world?"—"Thou art right, God in heaven does not much surpass me!"—The king drank some English beer from a bottle, which he immediately handed to the Dane; the latter took a little, and excused himself, by saying that the liquor would intoxicate him.—"It is not the beer that confounds thee," says Opocoo, "it is the brightness of my countenance, which throws the universe into a state of inebriety." This same king conquered the brave prince Oorsooeh, chief of the Akims, who slew himself. He caused the head of the vanquished prince to be brought to him, decked it with golden bracelets, and, in presence of his generals, directed to him the following speech:—"Behold him laid in the dust, this great monarch, who had no equal in the universe except God and me! He was certainly the third. Oh my brother Oorsooeh, why wouldest thou not acknowledge thyself my inferior? But thou hopedst to find an opportunity of killing me: thou thoughtest that there ought not to be more than one great man in the world. Thy sentiment was not to be blamed; it is one which all mighty kings ought to participate."^f

The ferocious actions of these little tyrants are not revolting to a people equally sanguinary as themselves, and who, even after their death, hasten to gratify that thirst for human blood which they consider as inherent in their royal manes. On the death of Freempoong, king of the Akims, that people sacrificed on his tomb, his slaves, to the number of several thousands, together with his prime minister, and 336 of his women. All these victims were buried alive, their bones being previously broken. For several days the people performed dances, accompanied with solemn songs, round the tomb where these unfortunates suffered lingering and horrible agonies.

Neither public nor private happiness can exist where laws and manners so barbarous prevail. Two thirds of the negro population lead lives of hereditary bondage in their own country, or are liable every instant to be reduced to that condition by the order of their despots. Perhaps it is of little importance to the greater part of these unhappy persons what country they water with their sweat and tears. It is true, indeed, that the sight of so many individuals, sold with the semblance of law, offers to the slave merchants some temptations to carry off free persons

by stealth or violence, and some horrid examples of such a practice are adduced. One of these merchants, known by the name of Ben Johnson, had carried off a free young woman, and sold her to an English captain. As he returned with the reward of his villany, other negroes, dispatched by the prince or the chiefs of the village, attacked him, bound him, and crying, "off with the thief," took him to the vessel, and offered him for sale. It was in vain that Ben Johnson appealed to the friendship of the European negro-dealer, reminding him that he was a free man, and his most active hand in procuring slaves. "No matter," says the unfeeling Englishman, "since these people sell you, I purchase you;" and instantly fixed his fetters. In other instances, a horrible avarice dissolves all the ties of kindred. Mothers are seen selling their children at an early age, for a few bushels of rice. One day, a stout young African took his little son to sell him to the Europeans; the latter, more cunning, and better acquainted with the language of the foreigners, showed them that a man of the strength and size of his father, was of more value than he, and thus prevailed with them to take him in his stead, though the latter kept calling out, that "no son had a right to sell his father."

Some despots consider the population of their territories as a large stall of cattle, from the sale of which they expect to derive a revenue. The town of Gandiulle was lately called on by the *Damel*, or king, for a contribution of eighty-three slaves, which, on their refusal to pay, he exacted by force. Gandiulle was transformed into a camp, filled with horse and foot, who flocked to the place for the sake of pillage, and wherever the same legitimate monarch arrived, his presence uniformly brought consternation, desertion, and wretchedness.^a

It cannot be denied, that these enormities are purely the offspring of the infamous traffic in negroes. The most dreadful thing is, that the African princes, in order to get possession of a hundred men, often sacrifice a thousand; for, when these despots do not find individuals whom they can condemn to be sold, they regularly hunt down the inhabitants of an entire village, like a flock of deer; some make an armed resistance, others fly to the woods, to the dens of lions and panthers, scarcely so merciless as their own compatriots. Several tracks of country have been depopulated by these atrocities.

It is certain that the slaves are carried off against their will, and most frequently in all the agonies of the most poignant affliction. This is not denied: but it is said that they consist of captives who would otherwise be slain, or criminals condemned by courts of justice. The answer to this is, and it is proved beyond all possibility of contradiction, that wars are now undertaken, incessantly, for the express purpose of procuring slaves for the market; and that since the establishment of this traffic, every crime is punished by selling the offender to a dealer;—accusations of witchcraft or adultery are always at hand to insure a supply to the traders on the coast; and if these fail, it is admitted, that by advancing a little brandy or gunpowder to the natives, a whole village may be legally carried off in satisfaction of the debt.

The necessity of crowding on board of one vessel several hundred slaves, often produces the most horrible scenes. Attacked by pestilential fevers, by famine and death, the

slave ship becomes at once an hospital, a prison, and a school of inhumanity and crime. More than one half of the blacks that form the cargo kill themselves or die of disease; sometimes the captain, reduced to a want of provisions, throws them alive into the sea to save the lives of the Europeans. The mariners employed in such a trade acquire a ferocious character, and afterwards stain the soil of Europe with crimes worthy only of degraded Africa.

The following extract from the *Bibliothèque Ophthalmique*, will give some idea of the horrors of what is called the middle passage: "The *Rodeur* sailed from *Havre* on the 24th of January, 1819, for the coast of Africa, to purchase slaves. When under the line, it was perceived that the negroes, who were heaped together in the hold, and between decks, had contracted a considerable inflammation in the eyes. They were successively brought on deck, in order that they might breathe a purer air. But it was necessary to discontinue this practice, because they threw themselves into the sea, locked in each other's arms. On the arrival of the ship at *Guadaloupe*, the crew was in a most deplorable condition. Of the negroes, *thirty-nine had become blind, and were thrown overboard.*"^b

To say nothing of the mental agony implied in the forcible separation of these miserable beings from their friends and their country, it is quite enough to mention, that upon an average, no less than seventeen in the hundred die before they are landed; and that there is a farther loss of thirty-three in the seasoning, arising chiefly from diseases contracted during the voyage. One half of the victims of this trade perish, therefore, in the rude operation of transplanting them; and probably not less than 50,000 men are cut off thus miserably every year, without taking into account the multitudes that are slaughtered in the wars to which this traffic gives occasion, and the numbers that must perish more gradually by being thus deprived of their parents or protectors.

Of their situation in the West Indies, few that desire to be informed need now be ignorant. They are driven at work like a team of horses, or a yoke of oxen, by the terror of the whip. No breathing time or pause of languor is allowed, they must work as cattle, draw altogether, and keep time exactly, in all the movements which their drivers enjoin. Of the infelicity of this condition, some estimate may be formed, from the precautions that are necessary to withhold them from suicide and from insurrections, which no precaution can ever long avert.^c

The exportation of slaves from Africa to the New World seems to have begun as early as the year 1503, when a few slaves were sent from the Portuguese settlements in Africa into the Spanish colonies in America. In 1511 it was greatly enlarged by Ferdinand the Fifth of Spain; and the benevolent Bartholomew de las Casas, blinded by compassion for the poor American Indians, proposed to the government of Spain, then administered by Cardinal Ximenes, during the minority of Charles the Fifth, the establishment of a regular commerce in the persons of native Africans. "The Cardinal, however, with a foresight, a benevolence, and a justice, which will always do honour to his memory, rejected the proposal; not only judging it to be unlawful to consign innocent people to slavery at all, but to be very inconsistent to deliver the inhabitants of one country from a state of misery by consigning it to those of another. Ximenes,

^a Mollien, *Travels in Africa*, p. 18.

^b *Bibliothèque Ophthalmique*, Nov. 1819.

^c *Edinburgh Review*, Vol. IV. p. 478, 479.

therefore, may be considered as one of the first great friends of the Africans after the partial beginning of the trade."^a

From that period to the first combination for its abolition,—from the truly great Cardinal Ximenes, to the illustrious ministers Pitt and Fox, there were never wanting voices to declare its iniquity; but it was not till the year 1727, and still more strongly in the year 1758, that the Quakers in England, at their yearly meeting, and in their collective character, fervently warned all their members to avoid being in any way concerned in this unrighteous commerce. In the yearly meeting of 1761, they proceeded to exclude from their society such as should be found directly concerned in this practice; and, in 1763, declared it to be criminal to aid and abet the trade in any manner, directly or indirectly. From this time there appears to have been an increasing zeal on this subject among the Friends, so as to impel the Society to step out of its ordinary course in behalf of their injured fellow men. Accordingly, in the month of June, 1783, the Friends, collectively, petitioned the House of Commons against the continuance of this traffic; and, afterwards, both collectively and individually, exerted themselves by the press, by private correspondence, and by personal journeys, to enlighten the minds of men concerning it, especially those of the rising generation. Indeed, by the frequent intercommunion of the Missionary Quakers from England to America, and America to England, the Quakers had earlier and greater opportunities, than any other body of men in Great Britain, of becoming acquainted with its horrors; while, from their religious principles, they were likely to be the first in becoming uneasy under the sense of its injustice.

The public efforts of Mr. Wilberforce, Mr. Fox, Mr. Pitt, and of other senators,^b the prodigious and persevering labours of Mr. Clarkson, the writings and exertions of the learned and courageous Granville Sharp, backed by the almost unanimous voice of the British public, after a struggle of nearly fifty years, received their final reward in the legal abolition of the trade relative to the British empire—a legislative measure which constitutes the glory of the administration of Mr. Fox and Lord Grenville. The act for this purpose received the royal assent on the 25th of March, 1807.

On the 2d of March of that same year, the slave trade was abolished in the United States, and by a subsequent act, it was declared a capital crime to engage in it.

In 1814, Denmark followed the example of Britain.

In the same year, the king of Spain engaged by treaty^c to prohibit his subjects from carrying on the slave trade, for the purpose of supplying any island or possessions, excepting those appertaining to Spain; and to prevent, by effectual regulations, the protection of the Spanish flag being given to foreigners who might engage in this traffic; and, in 1817, he further engaged, not to carry on the trade in slaves to the northward of the line; with an additional regulation, that the slave trade should be abolished throughout the entire dominions of Spain, on the 30th day of May, 1820; and that from and after that period, it should not be lawful for any of the subjects of the crown of Spain to purchase slaves, or to carry on the slave-trade, on any part of the coast of Africa, upon any pretext, or in any manner whatever; in consideration of

his Britannic Majesty engaging to pay the sum of four hundred thousand pounds sterling, as a compensation for losses sustained by his subjects engaged in this traffic. It must be allowed that his Catholic Majesty appears to have taken his humanity to no bad market.

In the same year, the King of the Netherlands also agreed to abolish the slave trade; but it was not until 1818 that he entered into a convention with the King of Great Britain, for the purpose of preventing their respective flags from being made use of as a protection to this nefarious traffic by the people of other countries. In this, he engages to prohibit his subjects "in the most decisive manner, and especially by penal law the most formal, from taking any part in the said iniquitous trade;" and the more effectually to put a stop to it, the two parties agree to a mutual right of search of their respective merchant ships, within certain limits, by ships of war of the two nations, on good grounds of suspicion that such merchant ships are engaged in the trade; and in the event of any slaves being actually found on board, the ship so engaged to be seized and brought to trial before a mixed court of justice, to be composed of an equal number of members of each nation.

In the year 1815, his Faithful Majesty of Portugal likewise brought his humanity to market, and agreed to abolish the slave trade to the northward of the equinoctial line in consideration of the sum of 300,000*l.* being paid to him by England; and a remission of the residue of a loan to Portugal of 600,000*l.* And in July, 1817, a further treaty was made, similar to that with the King of the Netherlands, agreeing to a mutual search of merchant vessels; to the establishment of two "mixed courts," one to be held on the coast of Africa, and one in the Brazils.

These courts are composed of a judge and an arbiter, named by each contracting party, who are to hear and decide, without appeal, in all cases of capture of slave ships brought before them; but such is the defective nature of the constitution, and such the practices of the courts of mixed commission, and the evasions of the treaties by the slave dealers, that the efforts of the officers, who are zealously and honestly bent on performing their duty, are often rendered completely nugatory, and they themselves placed in the most embarrassing situations.^d

In 1815, France professed to abolish the slave trade; but the laws enacted for this purpose are so lax and indulgent that they are any thing but efficacious:—They merely condemn the ship and cargo to confiscation; but such are the profits of one successful voyage, that they will afford an indemnification for the loss of several penalties. The French oppose the only effectual means of checking the trade—(short of declaring it piracy)—a reciprocal right of search.

During the war with France, when England engrossed almost the whole commerce of the world, and exercised the right of search upon all suspected vessels, the slave trade had nearly ceased on a great part of the coast; but, since the conclusion of the late war, the papers laid on the table of both Houses of Parliament, too clearly demonstrate that its atrocities have greatly increased. It was undoubtedly to be expected, that when England had withdrawn herself from this odious traffic, the most afflictive branch of which, (the middle passage,) she had pre-

^a Edinburgh Review, Vol. XII. p. 359.

^b Ibid. p. 360.

^c Quarterly Review, No. 51. p. 59.

^d Ibid. p. 60. 62.

viously mitigated by salutary regulations, the avaricious and unprincipled of all nations would rush in to fill up the void which she had made; but after the sovereign powers of Europe had, by their plenipotentiaries, solemnly declared the slave trade to be "the degradation of Europe, and the scourge of humanity;" when, in consequence of this unanimous reprobation, it had been settled by solemn treaties, that at the expiration of the indulgence granted to Spain and Portugal, to trade for a certain limited time, and within a limited space, it should wholly cease, it could hardly be anticipated that those very powers, in open violation of treaties, should be found, not only giving all possible encouragement to their own subjects, but by allowing foreigners to fit out in their own ports, and to assume their own flags, the more conveniently to carry on this detestable traffic, with all the aggravated horrors of which it is capable.

Although France has a squadron on the western coast of Africa, for the avowed purpose of preventing the trade, it is notorious that the slave vessels are scarcely incommoded by her cruisers; and the French officers, if they do not encourage, at least connive at, the numerous slave vessels that swarm upon the coast. In consequence of this, the trade, though proscribed by the nations of Europe, so far from being abolished, or even limited, is greatly extended, inflicting increasing misery not only upon its immediate victims, but upon the whole of this unhappy continent, and a considerable portion of the New World. So long, indeed, as the monopoly of the markets of Europe is secured to the produce raised by slaves, it will be in vain to expect the total and *bona fide* abolition of this traffic. Free labour is at present so high in the West Indies, as to hold out an overwhelming temptation to import slaves; and when such is the case, it is too much to trust to registry laws, and such devices, to prevent their importation. On this point, the opinion of Bryan Edwards is deserving of serious attention. "Whether," says he, "it be possible for any nation in Europe, singly considered, to prevent its subjects from procuring slaves from Africa, so long as Africa shall continue to sell, is a point on which I have many doubts; but none concerning the conveying the slaves so purchased into every island in the West Indies, in spite of the maritime force of all Europe. No man who is acquainted with the extent of the uninhabited coast of the larger of these islands, the facility of landing in every part of them, the prevailing winds, and the numerous creeks and harbours in all the neighbouring dominions of foreign powers, (so conveniently situated for contraband traffic,) can hesitate a moment to pronounce, that an attempt to prevent the introduction of slaves into our West India colonies, would be like that of chaining the winds, or giving laws to the ocean."^a There is, in fact, but one way effectually to put down the West India slavery, and that is, to allow the sugar and other colonial products, raised by comparatively cheap free labour in the East Indies, to come into competition with that raised by slaves in the West Indies. When this is done, the latter will be driven from the field; and there will be no farther motive to tear the poor Africans from their native soil.^b

With regard to the state of colonial bondage, the progress of general improvement is exceedingly tardy.^c Fif-

teen years have elapsed since the abolition of the slave trade was enacted by the British Parliament. But during that long period no effective measures have been adopted either by the Imperial Legislature, or by the Colonial Assemblies, for ameliorating the condition of the slave, or paving the way to his future emancipation. In many of the colonies, voluntary manumissions by the master still continue to be loaded with heavy impost; and this cruel tax upon private benevolence prevails even in colonies where the crown is the sole legislator. In all, the slave continues absolutely inadmissible as a witness in any cause, whether civil or criminal, which concerns persons of free condition; and even in questions affecting his own personal freedom, and that of his posterity for ever, the *onus* still rests on him to prove that he is free, and not, as in all justice it ought to do, upon the person denying his freedom, to prove that he is a slave. In none, is the marriage of the slave made legal, or guarded by any legal sanctions; and, with partial exceptions, his instruction in Christianity is left to the fortuitous efforts of voluntary missionaries.

The negro race, even supposing it to be inferior in intellectual capacity to the Europeans, the Arabians, and Hindoos, unquestionably possesses the requisite faculties for appreciating and adopting our laws and institutions. Notwithstanding the horrible picture which we have drawn of the actual state of Africa, the negro is not a stranger to the sentiments which honour and exalt human nature. Though we sometimes find parents selling their children, the ties of parental tenderness are in general as powerful as they can well be, in a country in which polygamy is practised. "Strike me, but say no harm of my mother," is a sentence familiar among the negroes. A Danish governor, on the Gold Coast, presented with his liberty a young negro who wished to sell himself in order to purchase his father's freedom. Friendship has had its heroes in Guinea as it had in the country of Pylades. Proofs of generous gratitude have also been displayed. Not long ago a French negro having become an opulent merchant, gave an annuity to his old master who had become unfortunate. There are some colonists who, like the ancient eastern patriarchs, live among their slaves as in the bosom of a family united by an inviolable attachment.

In Senegambia, the inhabitants of each village have their slaves assembled in a collection of huts, close to one another, and which is called a rumble. They choose a chief from among themselves, and if his children are worthy of the distinction, they succeed to the situation after his death. These slaves cultivate the plantations of their masters, and accompany them to carry their burdens when they travel. They are never sold when they have attained an advanced age, or when they are born in the country. Any departure from this practice would issue in the desertion of the whole rumble; but the slave who conducts himself improperly, is delivered up by his comrades to their master to be sold.^d

The finest feature in the negro character is heroic fidelity to a just master, and even to a severe one, of which Mollien gives a remarkable instance in the story of Quagieh, a negro overseer.^e

The negroes, as well as the Foulahs and other inhabi-

tants of the different villages in Senegambia, practise hospitality in the kindest and most delicate manner ; the whole exertions of the family seem devoted to console the fatigues and privations of a stranger ; a separate hut, food, forage for his beasts of burden, and personal service, are readily afforded, with apologies for defects, and often without the expectation of any return. The ferocious and perfidious conduct of a great many individuals in the different African nations and tribes, though in some communities more marked than in others, only serves to illustrate, by contrast, virtues which are of frequent appearance. The traveller Park gives an instance of kindness and hospitality experi-

^a Park's Travels, vol. I. p. 193.

enced by himself in the kingdom of Bambarra, which, for tenderness and simplicity, approaches almost to the stories of romance.^a The negroes are invariably found much better men than the Moors. When M. Mollien was at the African village of Sanai, in the interior, though the people were at war with the Foulahs, a caravan of Serracolets arrived, and the merchants of the two nations traded freely and securely, and were not even subjected to the least molestation or inconvenience from search. The two governments, relying on the probity of the merchants, agreed to protect them, and not a single instance occurred of a caravan having been pillaged by either of the armies.^b

BOOK LXIX.

AFRICA.

Continuation of the description of Africa.—General and particular description of Congo, or Southern Guinea, and of some adjoining states.

IN savage, unlettered regions, the caprice of the traveller, or the pedantry of geographers, occasionally invents new names, or supersedes those generally received. One denomination is for the most part as arbitrary as the other, and the choice to be made between the old and the new does not merit much discussion. The coast of western Africa, included between Capé Lopez de Gonsalvo and Cape Negro, is in commerce known under the general name of the *coast of Angola*.^a It is the *western Ethiopia* of certain French and Italian authors.^b It is part of the *lower Ethiopia* of the Portuguese, a great division of Africa which commenced near the fort of Mina, on the north side of the equator.^c The best geographers of the present day name it *Lower Guinea*, or *Southern Guinea*, to distinguish it from that which is properly so called, and for distinction, *upper Guinea*.^{d e} It would nevertheless appear more natural to give to this region the name of Congo, a kingdom under the government of which it was formerly almost wholly included, and the language of which appears to be the source of all the idioms that are there spoken.

Situated, like Guinea, in the torrid zone, but to the south of the equator, Congo enjoys nearly the same climate as those countries which we have described in the three preceding books, with this difference only, that the seasons appear in opposite months. Respecting the seasons, there can only, in strictness, be distinguished the two extremes of dry and rainy. In general, from the period of our vernal equinox until the end of September, no rain falls; but the winds from the south and south-east temper the atmosphere,^f and the heat, although intense, particularly in clear days, is nevertheless supportable. During foggy weather, which is not uncommon, the humidity of the air relaxes the fibres, oppresses respiration, and from the slightest exercise violent perspirations are excited, which undermine the health of strangers, and oblige them either to dry themselves by the fire, or to change their clothes. During the other half of the year the sun is less an orb of light than a burning furnace; his perpendicular rays would dry up the sources of life, and render the soil completly

barren, did not bountiful nature furnish a remedy in the coolness of the nights, which are equal to the days in length; in the dews of the evening and morning always abundant at this period. The air is farther cooled by the rapid torrents which furrow the sides of the hills, and by the numerous rivers which water the plains: we may also add the effect of the winds impregnated with humid vapours, which, during this season, blow periodically from the north-west, namely, from the Gulf of Guinea, and collect, among the mountains of the interior, immense masses of vapour in the form of clouds. From the beginning of October these reservoirs of water pour upon the country frequent rains, accompanied by storms of thunder and wind, which do not cease till the month of April.^g The soil, heated to a considerable depth, absorbs this water with avidity—nature revives and assumes a smiling aspect—vegetation is developed with an astonishing rapidity—the fields are covered with a fresh verdure—the trees push forth their buds, the odour of springing flowers perfumes the atmosphere.^h There are, nevertheless, in this as in other countries, exceptions to the rule: the rains sometimes do not come on until after the usual period, or even fail altogether; sometimes they fall in the dry or winter months. At all times the stagnant waters which remain after the rains, fill the air with mephitic exhalations, and render a residence near the coast dangerous to Europeans.

The inhabitants of Congo divide the year into six periods. The spring, *Massanza*, begins with the rains of October, which go on increasing until the month of January. Then follows the *n'sasou*; it is the season of the first harvest, and of the second sowing, the produce of which is collected in April. The rains which, since the month of January, had been only passing showers, recommence during the month of March, and continue, though slight, until the middle of May. It is into this interval that the *ecundi* and the *guitombo* fall. The *guibsoo* and the *quimbangala* constitute the latter end of autumn and the winter; this last marked by a destructive drought, which kills the leaves of the trees by depriving them of sap, destroys the herbage, and strips the country of all its beauty.

The correspondence of these with our climate, and the more modern division of Captain Tuckey, will be readily understood from the following Table.

In commencing an account of the physical geography of Congo, we immediately perceive that the two principal features are deficient, since as little is known of the direction of the chains of mountains as of the origin and the course of its rivers. The source of the greater number of the latter is from a plateau of table-land, or from a chain of mountains generally distant from the coast at least from one hundred and fifty to two hundred leagues. But this chain appears to open itself in front of two great streams which proceed from the interior of the continent, and of which the origin is unknown. The river *Coanza*, although the least considerable, is more than a league wide at its mouth; it rolls along its muddy waters with such irresistible force, that the sea is coloured by it to the distance of three or four leagues in the offing. It is navigable as far as the city of Masangano, which is at the distance of forty leagues in the interior; its great cataracts are sixty leagues farther. It appears to proceed from the south-east. The river *Congo*, called *Zaire*, or *Zahire*, by the natives, is three leagues wide at its mouth, and empties itself into the sea with so much impetuosity, that no depth can be there taken by the sounding line, on account of the violence of the current. The force of this current is felt at a distance of four leagues at sea, and some effect is even perceptible at twelve leagues; the water at that distance not only retains a blackish tint, but small floating islands of bamboo, hurried down into the ocean, surround the navigator, and even impede the passage of vessels.^a The cataracts of this river, situated at a distance of one hundred and twenty leagues in the interior, have a more sublime appearance than those of the Nile.

This great river undoubtedly rises at a very great distance; but is it reasonable to suppose that it is the same as the Niger or the Joliba? This conjecture, offered by M. Setzen more than ten years ago,^b has been revived by the unfortunate Mungo Park,^c and adopted as the basis for a new English expedition, destined to complete the discovery of the Niger. We shall sketch briefly the arguments by which we refuted this hypothesis at the time it was advanced. My opinion has been but too unhappily confirmed. The English expedition was unable to proceed more than a hundred and twenty miles beyond the first cataracts of the Congo, in a south-east direction. The Portuguese have penetrated farther than this. My friends, Captain Tuckey, and M. Smith the Norwegian botanist, both perished, the victims of an enterprise from which I had dissuaded them by private letters, and by articles in the public journals.

Wangara is a very low country; it is a marsh, and sometimes a lake. The interior of Congo is, on the contrary, mountainous, and very high. How can the Niger, issuing from Wangara, find a sufficient declivity towards those regions where the Zaire flows? Supposing that it directs its course, on leaving Wangara, to the south-east, it will very probably fall in with the river Camarones, or with those of Benin and Calabar, which, if one may judge by their mouths, ought to be immense rivers, and consequently derive their origin from a considerable distance within the interior.^d These are the reasons opposed to the identity of the Niger with the Zaire. Moreover, this last receives its greatest known stream from the south-east, under the name of *Coanga*, and it owes the abundance of its waters, according to the reports of the natives, to a considerable lake imperfectly known, and which they call *Aquilonda*. It may, perhaps, form a part of an entire system of lakes, similar to the lakes of Canada, and which may probably even include that of Maravi.

The soil, generally rich and fertile, rewards amply the labours of the husbandman. Nevertheless, the land along the coast, being either too sandy or too marshy, is unfavourable to cultivation. Sands also compose all the mountains of Loango, and are spread over the whole surface of Sogno, where, however, they cover a good soil. Among the other constituent parts of the soil of lower Guinea, there is an excellent argillaceous earth,^e entire mountains of oriental granite, porphyry, jasper, various kinds of marble, and even, according to Lopez, the hyacinth.^f There are also found aerolites, called in the language of the country *targia*.^g Limestone, which is wanting, except above the cataracts of the Zaire,^h is supplied by shells found in great quantities along the sea shore. Loango abounds in salt: it is obtained in shallows along the coast, from a spontaneous evaporation of the water; the negroes also prepare it by boiling.ⁱ The kingdom of Angola contains salt pits, from which are extracted pieces of salt two feet in length and from five to six inches in breadth. The salt sold in the markets by the name of *guisama* or *khissama* stone, is used as a medicine. According to Battel,^k it is a variety of rock salt, beds of which at the depth of three feet, extend over a considerable part of the province of Demba.

The mines of Loango and Benguela furnish abundance of excellent iron.^l Nearly all the mountains of Guinea are ferruginous; but the natives do not understand the mode of extracting the metal, and the Europeans, in this respect, encourage their indolence. In *Angola*, iron ore is found dissolved in the water of the river.^m With a view of arresting it, the negroes place in the river bundles of straw and dried vegetables, to which the metallic particles attach themselves.ⁿ According to Battel, Lopez, and Grandpré, copper and silver abound in Angola, and particularly in the kingdom of Mayomba, where the metal is found near the surface.^o There are also several mines of copper in Anziko, and in the mountains to the north of the river

Zaire : near the great cataract it is extracted of a bright yellow.^a Nothing, however, attests the presence of gold ; and every thing that has been said concerning the mines of the Portuguese colony of Benguela is mere conjecture.

If the riches of the mineral kingdom are less brilliant than they have been represented by former travellers, it is not so with the productions of the vegetable kingdom. In the valley of the Zaire alone, Professor Smith discovered 12 genera, and 250 species, of plants *absolutely new* ; besides, other 10 genera, and 250 species, which are only found in Congo, or countries adjacent.^b Nature here, all life and activity, presents to the eye a luxuriance which no description can exceed. The downs are enamelled with flowers of every hue. Tall and close grasses almost completely overarch the roads. The fields and woods are decked with lilies whiter than snow ; in every direction there are entire groves of tulips of the most lively colours, intermixed with the tuberose and hyacinth. The rose and jasmine, the ornaments of our gardens, would, in that region, require the aid of watering, which the European, either attached to commerce, or given up to indolence, altogether neglects.

Among the alimentary plants, is the *mafringo* or *masanga*, a species of millet, highly pleasant both in taste and smell, the ears of which are a foot long, and weigh from two to three pounds. The *Horcus*, of every variety, grows without culture.^c The *luno* or *luco*, probably the test of Abyssinia,^d forms a very white and pleasant bread, as good as that made of wheat ;—it is the common food of Congo. The ears are triangular, and the grains of an iron-gray colour, marked with a black spot ; they are not larger than those of mustard. The seed was brought from the environs of the Nile, shortly before the time of Lopez.^e The culture of European wheat has been tried in vain. Its over-luxuriant stalks grow to a great height,^f but continue barren. M. de Grandpré,^g however, witnessed the growth of ears which contained fifty-two grains. The maize, *mazza mamputo*, introduced by the Portuguese, is used for fattening pigs. It affords two or three crops. Buckwheat affords two crops ; it bears drought better than other corn,^h and its stalks rise from six to ten feet. Rice is abundant, but not esteemed. All the pot-herbs of Europe, such as the turnip, the radish, lettuce, spinage, the cabbage, gourd, cucumber, melon, and fennel, thrive well, and even attain a greater degree of perfection than on their native soil. The potato, called by the negroes *bala-puta*, or Portuguese-root, was brought from America, and has a higher flavour than in Europe. The American manihot, or cassava, whose root is used instead of bread, is also cultivated : as likewise the pistachio-nut, particularly in Loango : the yam ; the *tamba* and the *chiousa*, which are a species of parsnip. The *incouba*, or Angola pea, grows under ground. The *owando*, another species of pea, is gathered from a shrub which lives three years, and affords good nourishment. M. de Grandpré particularly mentions the *msanguï*, which has a taste resembling the lentil.ⁱ There are several kinds of bean, which, planted during the rainy season, afford three crops

in six months. The *neubanzam* is like our filbert, and requires little attention ; it forms the common food of the natives of Congo. The ananas,^k six spans high, and always full of fruit, grows naturally in the most desert situations,^l as the sugar-cane in the most marshy. This last reaches an extraordinary height : the negroes suck the juice, and sometimes bring it to market. The liquorice plant is here parasitical, and its flavour exists only in the stalk. Tobacco appears to be indigenous. It is negligently cultivated, although it is an object of the first importance among the negroes, women as well as men, who all smoke, and make use of earthen pipes. Some of them also use it in the form of powder. The vine has been transplanted from the Canary Islands and Madeira. Wine is made to the south of the river Zaire. That of the Capuchins is of an excellent quality.^m The cotton of Congo is not inferior to the American. The capsicum is extremely acrid. The clusters of the *inquoffo*, which climbs trees or entwines plants, afford another very powerful species of pepper. The *dondo* possesses all the qualities of cinnamon. The fruit of the *mamao*, a shrub with very large leaves, is like our gourd. The other shrubs and small trees to be noticed are : the *mololo*, like the lemon ; it is stomachic : the *mambrocha*, which is of a pale yellow, and resembles the orange : the *mobulla*, an aromatic and very wholesome fruit, which grows in the axillæ of the leaves, like our figs.ⁿ Besides the pisang, or banana, from which is made the bread of the rich, and the *bacova*, the fruit of the banana-fig, the *nicosso*, another kind of pisang, grows in clusters of the form of a pine-apple, containing more than two hundred delicious fruits, which ripen during the whole year. The orange, lemon, pomegranate, guava, &c. for the culture of which they are indebted to the Portuguese, have not degenerated.^o

In general, southern Guinea is enriched with the same vegetable productions as Guinea, properly so called. It possesses exclusively the *conde*^p of two species. Its fruit, in shape like a pine-apple, contains a white, farinaceous, and refreshing substance, which melts upon the tongue. The fruit of the *zaffo* is like our plum ; it is, however, larger, and of a bright red colour. That of the *oghohe* has the same shape, is yellow, sweet-scented, and of an agreeable flavour ; the tree is used in timber-work. The *insanda*, or *encanda*, an evergreen-tree, which in its leaves resembles a laurel, does not bear fruit ; but its bark is used in the manufacturing of stuffs which are in high esteem. Its branches reach the ground, and take root. It is probably the *ficus benianina*^q of Linnæus.^r The *mulemba*, which is very like the *insanda*, furnishes materials for stuffs of a much higher value. The resin procured from its trunk makes a good bird-lime. The *mirrone*, of the same genus, is an object of adoration to the negroes. The oils of the *liquieri*, or *luqui*, of the *capano*, or devil's-fig, and of the *purgera*,^s as well as the gums or resins of the *cassanevo* and the *almetica*, are used both in domestic economy and in medicine.^t The *muchia*, a tree as large as our oak, produces a pungent, but agreeable fruit. The fruit of the *avasasse* is as large as a nut, and has the

flavour of a strawberry. The juice of the *gegero*, which resembles an oblong orange, is strengthening. The seeds of the *colleva*, a very large tree, whose fruit resembles an enormous lemon, are red, bitter, and stomachic.

Forests of mangrove extend along the marshy coasts and the rivers. Sandal wood, red and gray, called *chigongo*, is abundant in Anzico. The tamarind trees and cedars which line the Congo river might afford wood for the building of large fleets.^a

Many species of the palm tree adorn the plains of Guinea. They have not been examined by any naturalist, but there appear to be several peculiar to this country.

The cocoa rises above all these useful trees; its fruit is here, as in every other situation, one of the greatest blessings of nature. The *matome* palm^b grows in a marshy soil. The ribs of its leaves, prodigiously large, are used for the roofing of houses, for ladders of thirty or forty steps, and for elastic poles to support the hammocks of the great.^c

The *matoba* palm, probably the *Cocos guineensis* of Linnaeus, yields a sourish wine; its fruit is smaller than the cocoa-nut; its leaves, shorter and wider than those of the preceding species, are used for the covering of houses, or for making hampers and baskets. The sap of the dwarf-palm, the smallest of the species, yields an unwholesome beverage, which the stomach of the negroes alone can bear. Very beautiful stuffs are manufactured from the fibres of its leaves. The date-tree, the fruit of which is excellent, bears here the name of *tamara*, the name given to it in the sacred writings. This might lead us to conjecture that some Hebrews or Arabs have penetrated as far as Congo. The fruit of the *coccatá* palm contains a delicious drink; it is of the size of a melon, and differs little from the cocoa-nut; the remaining substance affords a good aliment.

The tufts of the noble Congo palm enclose and embellish the fields and forests of the country of which it bears the name; its fruits, very abundant, are not inferior to those of any other species of palm; its wine is sweet, sharp, agreeable, and as strong as Champagne. When not deprived of its sap, it produces at the root of its leaves a fruit which a man can scarcely carry; its seeds have the colour and taste of chestnuts. When baked, they are the support of the poor; and when heated, afford a thick oil, used by the negroes for seasoning their food, and by Europeans for burning in lamps: the fibres of the leaves are used in making baskets, ropes, and mats.^d This palm, the same undoubtedly which Lopez mentions by the name of *cola*, and M. de Grandpré by that of *latanier*, as the most common palm, appears to be the *Elate silvestris* of Linnaeus.^e

We cannot conclude this account of the principal vegetable productions of Lower Guinea, without noticing that colossus of the earth, the enormous *baobab*, or *Adansonia digitata*, which is here called *aliconda*, *bondo*, and *mapou*. It abounds throughout the whole of the kingdom of Congo, and is sometimes so large, that the arms of twenty men cannot embrace it.^f The substance of its fruits, suffici-

ently large to kill, in their fall, both men and animals, presents a coarse food for the negroes, who, when in want, eat even the leaves of the tree; the shell affords solid *vases*; from the ashes of the wood soap is extracted; from the bark are made cordage, coarse canvass, serviceable stuffs for the poor, and matches for artillery. The tree being very subject to decay, the negroes avoid constructing their huts within its shade, lest they should be crushed by its fall; but the hollow formed in the interior of its trunk, frequently contains water sufficient to supply several thousand men for one day;^g and bees have a propensity to swarm in hives attached to the extremities of the branches.

The greater number of these trees and shrubs, are said not to bear conspicuous flowers; they are green through the whole year; only the leaves, which have an appearance of being scorched during the dry season, fall at the period when new ones come forth, at the beginning of the rains.

In ascending from plants to animated beings, we first observe slugs as large as the human arm.^h The sea-shore is covered with cowries. The fish, both of the sea and of the rivers, are scarcely better known to travellers than to the inhabitants, who are unacquainted with the means of taking them. M. de Grandpréⁱ believes, that the fresh water fishes, and those taken in the sea, wherever the depth does not exceed an hundred fathoms, are nearly the same as our own. A species of small *grumbler*^k may be remarked; the air does not destroy its life so quickly as in other fish; and for a long time after having been taken, it emits a cry which appears distinctly to articulate *cro-cro*. In fishing with a net, there is a risk of being struck by the torpedo, a species of electric ray whose tail is armed with a dart. The sting of this fish is generally followed by a considerable swelling, accompanied with acute pains during several days. Zucchelli and Cavazzi give many details concerning the lady-fish, or *Pesce donna*, which appears to be a phoca, perhaps the sea-cow^l (*manatus*.) Battel^m speaks of a cetaceous fish, called in the language of the country *emboa*, the dog; it resembles considerably the *Delphinus orca*, and drives before it, along the coast, great numbers of fish, and occasionally runs itself ashore; it is probably the *Delphinus delphis*. They dread, in the neighbouring latitudes, the saw-fish, differing little from those in the European seas: the *pico*, a large and dangerous fish; and many species of whales. M. de Grandpré enumerates certain species of the shark tribe,ⁿ which wage war with men, swallowing both blacks and whites without distinction. It is an error to suppose that the negroes of the coast have the talent and courage to oppose the shark by force. There are eels, of excellent quality, carp, squillone, and other fishes proper for food, in the rivers and lakes.

All the rivers are filled with crocodiles, called by some travellers *caimans*; they are generally twenty-five feet long, according to Cavazzi;^o there are some also which never enter the water, but hunt fowls, sheep, and goats. In another place^p however he states, that there are lizards which differ very little from crocodiles. Camelons are

found in great numbers, and are considered very venomous.^a The flying lizard, or palm-rat, a pretty little animal, is an object of religious worship;^b the rich preserve it with great care, and exhibit it to the adoration of the people, who offer it presents. Frogs and toads are of an enormous size.

Monstrous serpents infest these inhospitable countries. The *boa* or *boma*, in length from twenty-five to thirty feet, and five in circumference,^c darts from trees upon men and animals, swallowing them at once, and in its turn becomes a prey to the negroes, who attack it during its digestion, or burn it by setting fire to the savannas at the termination of the rains.^d It wages an interminable war against the crocodiles. The bite of another species of serpent is mortal within twenty-four hours. Travellers who are fond of the marvellous, represent it as blind, and describe it with two heads; they mean the *amphisbæna*. The *mamba*, as thick as a man's thigh, is twenty feet long, and very nimble. It instinctively chases the *n'damba*, and devours it whole and alive. This last is only an ell long, with a large and flat head like the viper, and the skin beautifully spotted; its poison is very subtle. The *n'bambi* is one of the most venomous; is with difficulty distinguished from the trees themselves, the trunks of which it entwines, lying in wait for its prey. It is reported that the touch only of the *lenta*, a variegated viper, is followed by death, but that the bile of the animal is its antidote. The country swarms with scorpions and centipedes;^e the former often creep into houses and books.^f

The fleas, bugs, and flies of Europe, are not found in Guinea; there are, however, gnats and mosquitoes in abundance,^g which form one of the plagues of the country. The sting of the *banzo*, of the same size as our gad-fly, is said to be mortal. Different species of very formidable ants infest both men and animals. Malefactors, who are sometimes bound and exposed to them, are consumed to the bones in one day. The *insondi*, or *insongongi*, enter the trunk of elephants, and cause them to die in extreme madness. The sting of the *inzeni*, which are a black and very large species, produces violent pains for some hours. The *salale*, (termes,) small, round, red, and white, are the most dangerous; they insinuate themselves every where, and destroy linen, merchandize, furniture, and even houses, the wood work of which they hollow out, leaving nothing but an external shell. According to De Grandpré,^h they have the instinct to fill up with clay the stakes which support the houses, to prevent their fall. Fire alone, and marble, can resist their devouring teeth; but furniture may be secured by placing the feet in pans of water.

In a country so infested with noisome and destructive insects, it is pleasant to know that one, at least, of considerable utility exists; it is a scarabæus, of the size of a cockchafer, which contributes essentially to the salubrity of the atmosphere, by making deep holes, and burying in them all impure and corruptible matters under ground; it is the more valuable in consequence of its wonderful fecun-

dity. Numberless swarms of bees wander in the forests, occupying the hollows of trees,—and it is only necessary to drive them away by lighting fires under them, and thus take their honey. Locusts are esteemed as food by the natives, and are not despised even by Europeans.ⁱ

The ostrich and peacock are esteemed by the negroes. In Angola, the king has reserved to himself the sole privilege of keeping peacocks.^k There are both gray and red partridges, which have the peculiarity of perching upon trees. The quail, pheasant, and thrush, the widow and cardinal birds, are found in abundance. The cuckoo differs from ours in its note.^l The *Cuculus indicator*, found in every part of the torrid zone, here bears the name of *sengo*. The parrots vary much as to size, colour, and voice.^m Very different from those we see in cages, strong, nimble, and bold, they fly with great rapidity, and are very formidable to other birds, which they attack, and lacerate most unmercifully in the combat.

The different species of turtle doves, pigeons, fowls, ducks, and geese of this country, are not well distinguished. The idle disposition of the natives has never thought of profiting by the use of the eggs of fowls in domestic economy. The hen, left to herself, deposits her eggs where she pleases, and runs undisturbed about the fields with her chickens in search of food. Among the fishing birds are the pelican, the diver, and gulls of every variety. The skin of the pelican, applied to the stomach, is said to restore its vigour.

It is astonishing to behold the immense number of eagles, vultures, falcons, hawks, and other birds of prey, which hover over the savannas when set on fire by the negroes, and snatch from the midst of the flames quadrupeds and serpents half roasted. According to the report of travellers, who have given a very superficial account of birds, the number of owls, screech owls, and bats, is also very considerable.

Among the quadrupeds, the hippopotamus affords the negroes an agreeable dish: which, on meagre days, is not unacceptable to Europeans.ⁿ The wild boar, (*engalli*), of which there are several varieties, is a scourge to the country. The hog, introduced by the Portuguese, is less remarkable for its size than for the goodness of its flesh. The blacks rear a few guinea-pigs. The use of the horse, the ass, and the mule, is a nullity to the negro, who dares not even venture to mount them. Whether negroes or Portuguese, the inhabitants find it preferable to be carried about in hammocks. According to Lopez and Battel, there is not a single horse to be found throughout the whole of Congo. A missionary declares that he had seen one only.^o Those which the Europeans had imported to multiply the species were either devoured by wild beasts or by the negroes, who like their flesh. The zebra is not rare in Congo, Benguela, and Loango.^p The negroes hunt it for food, and sell its skin to Europeans. Herds of two or three hundred buffaloes are often seen, which appear to be of the same species with those of the Cape. The hunt is dangerous. They are continually at war with the lion, the panther, and the

leopard. Oxen do not labour; the negroes do not attend to them, and most of the cows, left by ships at their departure, perish. The sheep brought from Europe are diminished in size, and their wool has become changed into a short hair; but they are very prolific.

Roebucks, wild goats, gazelles or antelopes, in great numbers, are to be found in those parts of the country which are near water. The size of the *empolanga* or *impolanca*^a is equal to the ox: he carries his neck upright, and his head high; his horns, three palms in length, crooked, knotty, and terminating in points, are made into wind instruments. Naturalists must decide whether this is not the *empophos* or elk of the Cape.^{b,c} Cavazzi distinguishes it from the *impanguas*, which he compares to wild mules; its flesh is eaten. The smallest species of gazelle is called *n'sosi*. Lopez is the only traveller who mentions rabbits, martins, and sables. M. de Grandpré adds hares, but the civet (*Viverra zibetha*)^d is here indigenous; the Portuguese, on their arrival, found some domesticated. Dogs rove in troops, and only utter a mournful howl; even those that are brought from Europe soon lose their power of smelling and barking.^e The wolves, whose flesh affords a meal to the negro, are their implacable enemies. These wolves, or rather jackalls, are very fond of palm oil, and have a quick scent. Too cowardly to attack men on the highway, they enter by troops into houses by night, and seize them while asleep. Their hideous cries in the deserts, spread terror among the caravans, who consider them as infallible presages of death. Zucchelli speaks of them under the name of *mebbie*, wild dogs, and distinguishes them very precisely from wolves.^f Another species of wild-dog, with spotted skin, is also mentioned: These attack with fury flocks of sheep, goats, the largest cattle, and even wild beasts; they are probably hyænas. The ravages occasioned by leopards and panthers, called in the language of the country *engoi*, are not less considerable. There appear to be two species of *engoi*; the one prefers the open country, the other the forests: the latter is the most formidable, from its sudden irruptions into inhabited districts. The *n'sosi* and the *gingi*, resemble in some degree the wild-cat and the tiger-cat.^g

The variety of monkeys which sport upon the highest trees, is so great, that travellers have despaired of being able to reduce them to a catalogue. They abound particularly in the environs of the river Zaire. Europeans are particularly partial to a small monkey,^h with a long tail and blue face, remarkable for its great gentleness and docility.

The largest monkey of Guinea, called *chimpanzee*, or *kimpezey*, in the country,ⁱ *pongo* or *cujoes*, by the traveller Battel,^k and by naturalists, *Simia troglodytes*, is not found far from the equator.^l Its height is four feet, and there is no appearance of a tail. M. de Grandpré had an opportunity of admiring the intelligence and even the soul of a female, which was subject to the same peculiar complaints as women. This animal had learned to heat the oven: it was particularly careful that no coal should escape, and

set fire to the vessel; perfectly understood when the oven was sufficiently heated, and never failed to apprise the baker of this circumstance; and he, in his turn, entirely confided in it, hastening to bring his shovel as soon as the animal came to fetch him, without ever being led into an error by his informant. When they heaved at the capstan, it endeavoured to assist with all its power, like a sailor. When the sails were bent for departure, it mounted, of its own accord, the yards with the sailors, who treated it as one of their own crew. It would have taken charge of the ear-rings,^m a most difficult and dangerous service, if the sailor who was destined to that particular post had not refused to give it up. It belayed the shroudsⁿ as well as any sailor; and observing how the end of the rope was fastened to prevent its hanging, it did the same to that of which it had possession. Finding its hand caught, and held fast, it disengaged it without crying, or altering its features; and when the business was over, it showed its superior agility over the other sailors, by passing them, and descending in an instant. This animal died on the passage, owing to the brutal treatment of the mate. It bore this cruel usage with the greatest resignation, raising its hands in a suppliant manner, to implore a remission of the stripes they were inflicting. From that moment, it refused to eat, and died of hunger and grief on the fifth day, as much regretted as any one of the crew would have been.

The ancients appear to have been well acquainted with this monkey.^o It generally walks upright, supported by the branch of a tree, after the manner of walking with a stick. The negroes dread it, and not without reason, for it treats them harshly whenever they meet. If credit may be given to more than one missionary,^p a connexion between these satyrs and negresses, to whom they appear singularly partial, has really produced species of monsters.

We shall now proceed to trace a chorographic sketch of the countries, the physical condition of which we have above described: at first confining ourselves to the countries bordering on the sea-coast, and to those of the interior politically connected with them, whose limits are tolerably well ascertained; though, with respect to the geographical position of the whole coast, Captain Tuckey has discovered that a considerable error has prevailed.

From Cape Lopez to Cape *Padron*, it has been laid down a degree farther to the westward than its true situation. From Cape Lopez to the bay of *Saint Catherine*, a port seldom visited, the coast is very little known, and appears to consist of low land, covered with trees. The natives are in a miserable condition, and considered treacherous. Their chief acknowledges the sovereignty of Loango. The river *Sette* waters a country from which red-wood has been exported; at present, however, it is not frequented. At the mouth of the great river *Banna*,^q is the bay of *Mayomba*, where there is rather more commerce; the inhabitants are more civil, hospitable, and intelligent, than those of the other states; they procure the greater part of the ivory sold in the neighbouring ports; they can work in copper, and are acquainted with the gum-tree;

but it is not true that the mountains of *Mayomba* contain gold: in that case, the natives would have worked the mines. Their chiefs are subordinate to the kingdom of *Loango*, which extends about fifty marine leagues from north to south, and sixty from east to west; but it contains, with its dependencies, at most only six hundred thousand inhabitants, so greatly has the slave-trade drained its population.^a The country round the bay of *Loango*, exhibits mountains of a red colour, tolerably steep, and covered with palms. The city of *Bouali*, better known by the name of *Banza-Loango*,^b the capital of the kingdom, situated about a league from the coast, in a large and fertile plain, has long, straight, and clean streets,^c and fifteen thousand inhabitants, tolerably industrious.^d It has an agreeable appearance, on account of the palms and pisangs which shade and cover the adjoining country. The water is excellent; but the harbour is not sufficiently deep for large vessels, and its entrance is obstructed by rocks. There is here a trade for fine stuffs, manufactured in the city, from leaves. Provisions, fowls, fish, oils, wines, corn, ivory, copper, and dye-wood, inferior to that of Brazil; and, it is to be remarked, that the negroes of *Loango* are not very nice with regard to the merchandize imported, and readily take what would be refused in other places. But the natives, from policy, and perhaps by means of poison, which they well know how to administer, have given their country the reputation of being extremely unhealthy, which has prevented Europeans from establishing themselves there, or even from sleeping on shore. The slaves brought to this market are *Mayombas*, *Quibanguas*, or *Montequese*: the *Mayombas* are inferior in quality, but most numerous: the *Quibanguas* belong to a small tribe in the interior; they are among the finest negroes, well made, very black, with a pleasing countenance; their teeth are particularly beautiful: the *Montequese* are well made, but spoil their teeth by filing, with a view of rendering them pointed; they also make long scars upon both cheeks, and sometimes on the body.^e

A fact worthy the attention of travellers, is, that, according to *Oldendorp*,^f the kingdom of *Loango* contains black Jews, scattered throughout the country; they are despised by the negroes, who do not even deign to eat with them; they are occupied in trade, and keep the sabbath so strictly that they do not even converse on that day; they have a separate burying ground, very far from any habitation. The tombs are constructed with masonry, and ornamented with Hebrew inscriptions; the singularity of which excites the laughter of the negroes, who discern in them only serpents, lizards, and other reptiles. *M. Ehrmann*, finding it impossible to explain the origin of these Jews, doubts the reality of the fact; *Busching*, however, *Michaelis*, and *Zimmermann*, do not hesitate to admit their existence; *Bruns* considers them as descendants of the *Falashes*^g of *Habesh*, or *Abyssinia*; and *Sprengel* wishes them to be considered as the descendants of Portuguese Jews, who, having quitted their country, are no longer afraid to profess openly the religion of their fathers. Five leagues to the north of *Loango* is *Quilonga*, a river

of very difficult access, whither trading vessels sometimes resort.

The kingdom of *Cacongo*, by sailors generally called *Malemba*, from the principal port, situated about sixteen leagues south of *Loango*, is famous for the excellent slaves formerly obtained there; it abounds in fruits and vegetables, kids, pigs, game, and fish.^h The king dines alone in public, surrounded by a numerous suite; but, as soon as he prepares to drink some palm wine, every one present is obliged to prostrate himself on the ground, lest the king should die if any one of his subjects should witness his drinking.ⁱ While sitting in the quality of judge, form requires that every judgment given should be followed by a draught of wine, with a view of refreshing his majesty. *Kingele*, the capital of the country, is about thirty leagues from the coast; it consists of several thousand huts, over which palms and other trees wave their verdant heads.

The bay of *Cabinda*, situated five short leagues to the south of *Malemba*, often gives its name to the kingdom of *N^o Goyo*, otherwise *En-Goy* or *Goy*. It is a very fine harbour, called the *Paradise of the Coast*, and the most agreeable situation of all the surrounding country.^k The sea is always smooth, and debarkation very easy. The Portuguese, after having, at different periods, endeavoured to establish themselves here, made a last attempt during the American war, and opposed by force the first vessels which came to trade at this port, after the peace of 1783. The French government sent an expedition commanded by *M. de Marigny*, who destroyed the fort, and made the trade free. The country, in general, is very fine, extremely fertile, and contains many beautiful spots. The capital is at a distance of two days journey in the interior.

The slaves from this port consist of *Congos*, *Sognos*, and *Mondongos*, whom the blacks call *Mondongonese*.^l The *Sognos* are generally copper-coloured, large, and tolerably well made. The *Mondongonese* are both handsome and of good dispositions; but they are accustomed, like the *Montegnese*, to whom they are neighbours, to cut their faces so as to make large scars; their teeth also are all filed. They likewise score their breasts in various symmetrical forms, allow the skin to swell before it heals, that it may be raised above the edges of the wound, and thus form a sort of embroidery of which they are very vain. The women also lacerate their neck unmercifully for the sake of this supposed beauty. They have besides, the folly to inflict three large wounds on the belly, and to make the skin swell, so that three large transverse protuberances may be formed upon this region. They never cease to cut and to heal the wound alternately, until it has acquired the extent desired. Many blacks, chiefly among the *Mondongonese*, are circumcised, but they do not appear to attach to it any religious idea.

After crossing the *Zaire*, you immediately enter the kingdom of *Congo*, bounded on the south by the river *Danda*, by the sandy deserts and the lofty mountains of *Angola*, on the east by the countries almost unknown of *Fungeno* and *Matamba*, by the Mountains of the Sun, and

the rivers Coanza and Barbeli,^a which last appears to be the principal branch of the Zaire. Many pleasant islands rise from the bed of the Zaire. It overflows during the rainy season, and fertilizes the adjoining country; nevertheless, far from frequenting it, ships avoid it on account of the unhealthiness of the air and water. Tuckey found its risings to take place both in the wet and dry season, commonly to twelve feet of elevation in the wet, and seven feet in the dry season. From the latter increase, he considered the northern origin of the Zaire as demonstrated.^b Going towards the south is the river *Ambriz*, where there is a small roadstead. The port itself, within a bank of sand, can only receive two vessels.^c The river *Mapoula*, is still farther to the south. Vessels do not go thither, on account of the exactions of the Portuguese, whose last stations are found in this neighbourhood.

The country of Congo is extremely fertile, and produces two crops within the year, the one during the month of April, and the other in December.^d Besides palm trees, which are very fine, there are forests of jasmine, and wild cinnamon trees in great numbers. Hogs, sheep, goats, fowls, fish, and the tortoise, are in abundance.

The Portuguese, whose missionaries have been active since 1482, in preaching the Gospel to the inhabitants of Congo, have succeeded in bringing this kingdom under their sovereignty; but whether owing to weakness or negligence, they leave it a prey to intestine revolutions. In order to familiarize the negroes with the forms of European civilization, they have made the nobles adopt, instead of the native title of mani or lord,^e the titles of duke, count, and marquis, and have divided the kingdom into six provinces, viz. Sogno, Pemba, Batta, Pango, Bamba, and Sandi. Sometimes they reckon only five: San Salvador, the residence of the king; Bamba, Sandi, Pemba, and Sogno. Bamba and Sandi are dutchies, Sogno, a county, and Pemba, a marquise. Each of these provinces has a banza, or residence for the chief.^f

The capital of Congo, called by the Portuguese San Salvador, forms, with its precincts, a particular district, under the immediate government of the king, and is bounded by Sogno, Sandi, and Pemba. It is situated very far in the interior, upon a high mountain containing mines of iron. Its position is extolled as one of the most healthy in the world.^g Its streets are wide, and it has many squares symmetrically planted with palm trees, whose perpetual verdure forms a pleasing contrast with the whiteness of the houses, which are washed with lime both within and without. Its population is subject to great variation, in consequence of the revolutionary tumults which are inseparable from the accession of a new king. At the beginning of the 18th century, when Zucchelli visited the city, it presented a heap of ruins.^h On the summit of the mountain there is a fort, which was built by the Portuguese soon after their arrival, and which now encloses the king's palace with its dependencies. There are still some remains of churches formerly built by them. The dispersed Europeans, estimated at forty thousand persons, have established themselves in other situations, diffusing among the natives necessary and useful arts.

The province of Sogno or Sonho, to the west of San Salvador, between the Zaire, the Ambriz, and the sea, has a sandy and dry soil, very favourable, however, to the growth of palms. It has good salt pits along the seashore, which are very productive to its prince. Times of scarcity, which frequently occur, do not diminish the natural gaiety of the inhabitants. This scarcity, joined to a superabundant population, has forced many to quit the country, and to establish themselves in Cacongo, on the north side of the Zaire. M. de Grandpré describes them as quarrelsome, morose, treacherous, and cowardly: one thing may be considered as certain, that they are very ill-disposed towards Europeans of every description.ⁱ

Bamba, also situated on the coast, between the rivers Ambriz and Loz, to the south of Sogno, and west of Pemba, is one of the great and fertile provinces of the kingdom. It has numerous salt pits, and fisheries of cowries.^k Its mountains, rich in metals, extend as far as Angola.^l

The province of *Pemba*, situated in the centre of the empire, is watered and fertilized by the rivers Lelunda, Kai, and Ambriz. Its proximity to the capital gives a stimulus to activity and industry, and renders the inhabitants secure from those persecutions to which the other provinces are subject from their governors.

Batta, situated to the east of Pemba, and north of the burnt mountains, is of considerable extent. It is asserted that the inhabitants, generally called *Mosombi*,^m have, from the natural goodness of their disposition, adopted the Christian religion with more zeal than all the other Congos. Nevertheless, and probably on account of these sentiments, they are generally at war with the neighbouring pagan districts, particularly with the formidable Giagas. Their governor has the sole permission of maintaining musketeers taken from among the natives, while all the other governors of provinces are compelled to employ Portuguese troops.ⁿ The Mosombi can raise from seventy to eighty thousand men.

The province of *Pango*, is bounded on the west by Batta, on the south by Dembo, and the mountains of the Sun, on the east by the river Barbeli, and on the north by Sandi.

Sandi, to the north-east of St. Salvador, is bounded on the north by the river Zaire, on the south-east by the provinces of Batta and Pango, on the north-east by the kingdom of Macoco and the Crystal mountains, at the foot of which the Bancoar empties itself into the Zaire. The country is well watered and rich in metals, particularly iron. The mountains to the north of the Zaire, near the great water-fall, where the Dukes of Sandi exercise a precarious authority, contain mines of yellow copper, which is sold at Loanda. The tranquillity of this province is frequently disturbed by the insubordination of the district chiefs, who revolt against the Duke. The Giagas and other savage tribes, by their frequent inroads, keep up the ferocity of their habits. Merchants, however, carry on a profitable trade by bringing salt, cowries, as well as Indian and European goods, in exchange for ivory, skins, and stuffs.

Besides these six provinces, there are others more or

ⁿ Lopez, p. 37.

less important, viz. *Zuiona*, *Zuia Maxondo*, *N° Damba*, *N° Susso*, *N° Sella*, *Juva*, *Alombo*, *N° Zolo*, *N° Zanga*, *Marsinga*, *Mortondo*; these are in a great measure uncultivated, deserted, or occupied by savage nations, who lead a wandering life in the midst of forests, or in the narrow passes of inaccessible mountains.

The province of *Ovando*, on the confines of Angola, was formerly subject to the King of Congo, but the chiefs have withdrawn themselves from the authority of their lawful sovereign, to place themselves under the protection of the Portuguese, who honour them with the title of Duke. The *Dombi* have also been influenced by this example, and by the arts of the missionaries.

The different meanings attached to the name of *Angola*, have caused some confusion in the accounts of travellers in Lower Guinea. This name is frequently given to all the country situated between Cape Lopez Gonsalvo and St. Philip de Benguela, viz. from 0° 44' to 12° 14' of southern latitude. The Portuguese, however, ever jealous of their colony of Loanda-San-Paulo, do not readily allow access to strangers, who, consequently, scarcely advance towards the south beyond Ambriz in 7° 20' of latitude; it is the coast therefore, from this port to Cape Lopez, to which the name of Angola is generally given in commerce.^a

The kingdom of Dongo, Angola, or N° Gola, of geographers, is bounded on the north by the river Danda, on the east by Matamba, on the south by Benguela, and on the west by the sea. Before its conquest by the Portuguese, its boundaries extended from 8° 30' to 16° of south latitude.^b It is a very mountainous country, and little cultivated. From May to the end of October, no rain falls. Its dry and stony mountains have no springs; fresh water therefore is very scarce. The idea of making cisterns is beyond the narrow understandings of the natives; the industry of the more provident among them, is confined to the hollowing of troughs from the trunk of the Aliconda, in which they preserve rain-water. The Portuguese having been unable to convert these people to Christianity, content themselves with enrolling them for military service. The garrisons of the greater number of their forts consist of Angolese, whom, however, they do not instruct in the use of fire arms. With the view of attaching them, they have given to the natives some privileges, the most important of which is, the appointment of their governors or viceroys. Salt, wax, and honey, are the principal productions of the country.

Quitama holds the first rank among its provinces. It is situated at the mouth of the Coanza, a rapid and deep river, which vessels may ascend to the extent of forty leagues. It abounds with the hippopotamus. *Sumbi*, the second province, is watered by the rivers Nice, Caiba, and Catacombole. Fine pasture grounds are seen occupied by serpents, and wild beasts. Some islands, situated at the mouth of the Catacombole, are cultivated and populous. They breed numerous herds of horned cattle.^c

In arriving from the north, on the coast of Angola, we first meet with the city of *Loanda-San-Paulo*, the capital of the Portuguese settlements in the west of Africa. It is situated at the bottom of a gulf, at the mouth of the river

Bengo, and has a good port, defended by batteries and by a garrison of malefactors. The city is built partly upon the sea-shore, and partly on an eminence which commands the country. Regular sea-breezes moderate the summer heats. According to Raynal, its population is from seven to eight hundred whites, and three thousand free negroes or mulattoes. Earlier and more probable accounts, estimate the number of whites and free men of colour at three thousand, without determining the number of black slaves who form the principal wealth of the inhabitants; one proprietor often has more than a hundred in his service. Almost every slave understanding some trade, they work for the profit of their masters.^d There is a tribunal of the inquisition, a bishop, many convents, and churches in every respect worthy of the devout Portuguese. Nothing can equal the magnificence with which the saints' days are celebrated. The rich inhabitants have built elegant country houses on the banks of the Coanza, the Bengo, and the Donda, which diversify the prospect over a circumference of forty leagues.

The island of Loanda shelters the port, and supplies the city with good water. It is rendered remarkable, by the fine brown, brilliant, and much esteemed cowries, which are fished solely on account of the king of Portugal. The suspicious jealousy of the Portuguese conceals, under an impenetrable veil, the commerce and industry of this place. But it appears from positive data, that Loanda communicates by land with Mozambique, by means of caravans, which coast along the river Zambese.^e

Benguela, although equally subject to the Portuguese government, has retained the title of kingdom, and some insignificant privileges. It extends from the rivers Cube-gi and Coanza, as far as Cape Negro. Its eastern limit is formed by the river Cumeni. Its interior, hilly and rugged, conceals prodigious numbers of elephants, rhinoceroses, zebras, and antelopes. The oxen and sheep are of an extraordinary size; but the extreme droughts, the wild beasts, and the incursions of the Giagas, have considerably diminished their number. There are excellent salt pits in Benguela.

The province of *Lubolo*, on the confines of Quissama, abounds in palm trees; numerous herds of antelopes feed under their shade.^f It sometimes gives its name to the whole territory comprised between the rivers Congo and *dos Ramos*.

The province of *Rimba*, abounds in corn, and has good fisheries. *Secla*, to the west of Bamba, is a hilly and well-watered country, rich in pasturage, and in excellent iron. The mountain rocks support, on their summits, many fields well cultivated, where the inhabitants breathe a pure and wholesome air.^g

The provinces of *Upper* and *Lower Bemba*, abound in horned cattle, tame as well as wild; the river *Latano*, called by the Portuguese *Guavoro*, or *Rio San Francisco*, which runs through them, abounds in fish, crocodiles, serpents, and the hippopotamus. The idiom of the people of Bemba is peculiar, and very difficult. They are prone to idolatry and superstition. The skins of animals and serpents, pierced with a hole for their heads, serve them for clothing.

^g Tuckey, 352.

Tamba, bounded on the east by *Bamba*, is a level country intersected with rivers and marshes. *Impolancas*, and *impanguas*,^a are found there in considerable quantity. The source of the Congo, it is said, is at the bottom of a rock, surmounted by a Portuguese fort, which commands the province. The country of *Wacco*,^b consists of hills and fruitful valleys. *Cabezzo* abounds in metals, particularly in iron.

The Portuguese establishment of *St. Philip de Benguela*, on the river of that name, in a very unhealthy situation, is defended by a garrison of two hundred transported convicts;^c and contains only houses built with mud and straw.^d Old *Benguela*, is a post still more insignificant.

The kingdom of *Matamba*, lies between the limits of Congo and *Benguela*; towards the east, it is occupied by very high mountains and thick forests; the air is temperate, and the soil fertilized by the overflowing of the rivers. The chiefs of *Matamba*, formerly tributary to the kings of Congo, are at present independent. The shores and islands of the *Coango* and the *Coanza*, are almost the only cultivated parts of the country. The natives have little industry. They extract the iron of their territory, without knowing properly how to work it; for they purchase from strangers their implements of agriculture. Unwrought mines of gold are supposed to exist in the mountains.

Such is the account of those countries of southern Guinea hitherto known, and in some measure civilized; or, at least, regularly inhabited. We will now consider the physical, moral, and political condition of these people.

The negroes of Congo appear to be inferior in understanding to many other African tribes. They possess, however, a very good memory: but their sentiments, instincts, and desires, are gross; their passions quick and fierce; their manners, customs, and general mode of life, in their savage and primitive state, approach so near to animality, that it is not surprising they should have considered monkeys as belonging to their own species. Their stupidity is such, that they have never been able to comprehend the advantage of a mill. The women, who alone perform all the work, are obliged to pound the corn in a wooden mortar, and then to grind it in a hollow stone, by turning about another stone with the hand.^e They have not the least idea of writing; their time is divided into day and night, and the day into three parts. They do not, however, understand the period of a year, and reckon by lunations. Their navigation is confined to fishing, for which they make use of boats made of the trunks of trees hollowed out by fire, without any form on the outside. Their nets, which they have attempted to form after the European manner, are equally bad. The coast, fortunately, abounds in fish. They are equally inexpert in hunting; have no trained dogs, and can only proceed by the eye. The sportsman is some time adjusting his piece, turns his head and fires, drops the piece, runs off as quickly as possible, returns some time after to fetch his gun, which he approaches with trepidation, and if he finds the game, carries it off in triumph. Their courage is not more conspicuous in the wars which

they wage among themselves. An army of two hundred men is considered a large and very uncommon armament.^f Born in a state of brutish ignorance, at the same time puffed up with pride and vanity, these degraded beings are, of all masters, the most severe, barbarous, and capricious; their slaves approach them on their knees; and the great, who alone wear slippers, treat the people with an extreme haughtiness; they are compelled to bow their servile faces in the dust. All the people look up to their kings as the greatest monarchs of the globe; these are proud of their prerogative to wear boots when they can procure them, and are often ludicrously dressed in some worn-out European uniform, which hardly covers their disgusting nakedness. They consider their country, which is disputed with them by wild beasts, as the most beautiful, delightful, and highly favoured in the world.

The most unrestrained polygamy exists in Congo, and the whole influence of the Christian religion has been confined to the discouragement of incestuous marriages. The holy state of marriage, the mutual affection of man and wife, and the enjoyments of domestic happiness, are foreign to the ideas of a Congo; surrounded by a numerous progeny, he feels no attachment to his children.^g Drunkenness, noisy music, indecent dances, and sleep, are his enjoyments. Useful works are performed by females, and numberless slaves. A rich man sometimes gives a *vingaré*, or public dinner, to the whole village; on those occasions they drink largely of *melaffo*, or palm wine. Their dress is highly fantastical; the princes and lords of Congo, *Batta*, and *Sogno*, are proud of dressing in a black hat.^h The great of *Lubola* attach small bells to their girdle. The inhabitants of the countries watered by the *Coango* and the *Coari*, file their teeth until they become as pointed as those of the dog. Some have four of them drawn. In the kingdom of *Matamba* they universally retain the ancient custom of making incisions in their flesh.

Among the singular customs in Congo, may be remarked that of husbands going to bed when their wives are delivered. *Zucchelli* mentions this circumstance. It is, moreover, singular, that this custom should be found among so many different nations; the moderns have observed it in *Bearn*, in *Tartary*, *India*, and a considerable part of *America*.ⁱ The ancients attest its existence among the *Cantabrians*,^k the *Corsicans*,^l and the nations near the *Euxine sea*.^m It is difficult to explain how the same custom should have been carried to nations so far separated, and such complete strangers to each other. On the contrary, it is easy to explain its origin, by observing the general character of savage nations. The birth of a child is a happy event, and the friends of the parents generally wish them joy on the occasion. In civilized countries, it is the mother who receives the congratulations, in a bed-chamber highly decorated. Among savage nations, where the woman is only a slave, these congratulations are addressed to the husband. For the purpose of receiving these with due solemnity, he reclines either on his hammock or on his bed; he continues there as long as the visits last, and, from idleness, some days longer. That he may not die of hun-

ger, it is necessary that his wife should feed and take care of him.^a

The king of Congo's court is a wretched imitation of the ancient court of Lisbon: the monarch, sitting on his throne as in Europe, is attended by black counts and marquises, attired in coarse imitations of the European costume and orders. The Pagan kings have retained the barbarism of their indigenous pomp. The King of Loango in former times, once a-year, and with great ceremony, went out to meet the whole nation, to give a solemn order to the rain to water the earth. It sometimes happened that the clouds obeyed; the people then returned well convinced of the power of their prince.^b The people having now, however, become more intelligent and less docile, the king has ceased to order rain and fine weather. One of his ministers at present performs this duty; but that he may shelter, in some measure, his responsibility, he carefully defers ordering the rain until it has fairly begun. The Congos say their country once formed a mighty empire, the chief of which divided it amongst his three sons, giving to one both sides of the upper part of the river as far as Sangalla; to the second, the left or northern bank, *Blindy N' Congo*; to the third, the right bank, *Bunze N' Yonga*. The two latter are still considered as separate viceroalties. The English, in 1816, found Congo divided into a number of petty states, or chenooships, held as a kind of fiefs under some real or imaginary personage living in the interior, nobody knows exactly where. Tuckey^c could only learn that the paramount sovereign was designated *Blindy N' Congo*, and resided at a *Banza* in the interior, named Congo, six days' journey south from the river, where the Portuguese had an establishment, and where there were soldiers and white women. This place is no doubt the *San Salvador*^d of the Portuguese; and whether or not this prince, as is stated, be quite independent, all the kings of the provinces situated between Cape Lopez and the river Zaire, do homage to the king of Loango, and pay him a tribute in women. In other respects they are despotic, without opposition: in fits of ill humour they sell their prime ministers to Europeans, and crouch before their vassals when they dread their power. They dispose of the liberty and lives of all their subjects, and tax them as they please. A black was fined exorbitantly for having once taken a fancy to use an old sedan chair given him by a captain.^e These kings thus indemnify themselves for particular privations enjoined them by a fundamental law of the state. They are obliged, at least in public, to forego the sweet enjoyment of brandy, since they are not allowed to receive, wear, or even touch any foreign production; metals, arms, and works in wood, excepted. Their domain consists of all the land not occupied, and of some villages. The throne is every where hereditary, except in Loango, where all the princes of the different dependent states may aspire to the supreme power, depending on the choice of an electoral body, composed of the seven principal officers of the crown, with two associated lords; which, in the interim, forms a provisional government. By this very ancient arrangement, the complicated nature of which indicates some legislator, or conqueror, more sagacious than the ordina-

ry inhabitants, as its author, the feudatories have a lively interest in the support of a throne to which they may aspire; and these ties will not be easily dissolved. To be prince-born, one must be the issue of a princess; it is the mother, and not the father, by whom he is ennobled: the latter cannot be certainly known. The princesses also have a right to choose their husbands, and to repudiate them at pleasure, by inviting another to the honour of their bed. The princes do the same, but their children, who are not the offspring of princesses, have no rank, and may be sold by such of their brothers and sisters as enjoy this advantage. The husband of a princess has the rank of prince during the period of his living with her, and retains his rank for ever if she dies during this interval. If a prince is married to a princess, they lose the power of being divorced. Princes in general enjoy great privileges: they cannot, however, hold any office under the government.

At Loango, the principal officers of government, next to the king, are the *Great Captain*,^f first minister and chief justice; the *Mafook*, minister of commerce; the *Maquimbe*, inspector-general of the coast, or port-captain; the *Monibanze*, minister of finance; the *Monibele*, messenger of state; the *Soldier King*, generalissimo of the army, and grand executioner. In the other states, the presumptive heir to the crown is the second personage; he is called *Mambook*. His situation is in many respects more agreeable than that of the king himself. After him comes the *Mwage*, prime minister, whose authority is restricted by that of the *Mambook*, and the princes-born; the *Mafook*, the *Maquimbe*, the *Monibanze*, the *Monibele*, the *Great Captain*, who here enjoys the same authority as the *Soldier King* of Loango; then the governors, and the lords paramount.^g

The ranks of society, without regard to office, are thus arranged: the king and his family, the princes-born, the husbands of princesses, the lords paramount, brokers, slave merchants, and vassals. These last constitute the mass of the people. They are obliged to serve, follow, and defend their master, who, on his part, lodges, clothes, and protects them. The merchants compose that immense body, who traverse the whole of Africa in search of captives, whom they transfer to Europeans through the medium of brokers. These, although belonging to all the classes, are in high repute, on account of the distinction with which men so useful are treated by Europeans. The lords paramount are land proprietors, not attached to the soil, although serfs of the king and the princes-born.^h

The king is supreme judge; but as the lords make every endeavour to obtain justice for their vassals, their complaints seldom reach the throne. The lords of the complainants and defendants are the first judges. According to circumstances, the decision of the *Mafook*, or *Maquimbe*, or a *Governor*, or even of the whole body of magistrates, is necessary. The court is public. The spectators, without arms, if the suit is not criminal, range themselves in a circle round a carpet, upon which are placed, at the expense of the parties, bottles of brandy proportioned to the number of assistants; for, no brandy, no trial.ⁱ Every person has a right to harangue, and each pleading is accompanied

with libations mingled with songs. As soon as the sentence is pronounced, the bottles are emptied.

Traditions and usages are substituted for written laws. The only capital crimes are stated by Tuckey to be those of murder and adultery. Considering the alacrity with which, from the prince to the *Foomoo*, or private gentleman, they all prostitute their wives and daughters to Europeans, and the resentment expressed by the latter, on the occasional refusal of their favours, the capital punishment of adultery might with some reason be disputed; but the English, in the Congo expedition, were in one instance witnesses to its actual execution.^a The criminal was, however, first offered for sale, and the probability is, that the great demand opened by the slave trade, has commuted many capital punishments of former times into the more profitable infliction of foreign slavery. The son of a *chenoo*, or chief, however, cannot compromise his honour; he is held bound to kill the aggressor; and, should he escape, may take the life of the first relation of the adulterer he meets. The reaction produced from this unjust revenge upon relations, which extends even to poisoning and theft, is one of the grand causes of the constant animosities subsisting between neighbouring villages. Poisoning (the only kind of private murder among them) is so frequent, that the master of a slave always makes him taste his cooked victuals before he ventures to eat of them himself; it is well known that the husbands of princesses, who, though chosen against their wills, are by law subject to divorce or slavery, at the pleasure of the latter, frequently rid themselves by this means of their wives and their fears at the same instant. In general, if the offender has committed a theft, he must refund; if the debt amounts to the value of a slave, he becomes one himself, in default of payment; if he has committed adultery, he must pay to the outraged husband the value of a slave; if he has shed blood, he must either give a slave, or the value of one, in order to prevent his being sold himself; if he has fraudulently sold a black, to whose person he had no claim, or committed a homicide, he is immediately rent in pieces by the people, and his body left to be devoured by birds of prey. Thanks to the universal slavery, *here every man has equal rights*. The princes-born alone cannot be sold; the lords paramount, when condemned, are allowed to deliver up one of their vassals in their stead.

When the criminality of the accused is not sufficiently manifest, he is subjected to the ordeal of poison and of fire, which is directed by the priests. It is probable that these jugglers have some means of rendering the potion presented to the accused either mortal or harmless, according to their pleasure, and of managing the heated iron in such a manner that it may touch and not burn the skin of their friends.^b One of the most singular proofs consists in obliging the two parties to drink the infusion of a root called *ambondo*, which has a twofold operation; since this potion either acts by evacuation and secretion of urine, or exerts its influence upon the brain as a narcotic. The people wait to see which of these effects will be produced; the individual who speedily evacuates the potion is proclaimed victor; and his unfortunate antagonist, who, after

some time, not being able to return it, is seized with vertigo, is considered guilty. "He does not evacuate!" cries the mob, and immediately they assail him with blows until he dies.^c

It often appears singular to find among illiterate nations, idioms, in which syntax and grammatical forms, ingeniously and artfully combined, indicate a meditative mind, at variance with the habitual state of these people. Are these the remains of an extinct civilization, of which every other trace has disappeared? Are they the efforts of some legislators superior to the rest of their nation? Are they the remains of ancient sacred languages, used by the people at large after the destruction of the tribes of priests, between whom they formed the bond of communication? In whatever manner it may have arisen, the language of Congo, of which those of Loango and Angola appear to be dialects, is distinguished by very copious and complicated forms. The different articles added to the termination of the substantive whose meaning they determine, the regular formation of derivatives, the numerous modifications of the pronouns, the great variety of moods and tenses of verbs, by which every thing relating to person and locality is expressed, the astonishing number of derivative verbs,^d the abundance of sonorous vowels, the absence of hard sounding consonants, and the softness of the pronunciation, conspire to make this language of an illiterate people one of the finest in the world.^e Apparently without any sufficient reason, and without seeming to know that the structure of his own tongue was most perfect when the nation was still involved in barbarism, the peculiar elegance and flexibility of the Congo language has been called in question by the editor of Tuckey's narrative. The affair, however, lies between him and the Congo grammarians we have quoted; our readers will be much more interested to know, that from a comparison of the works of the latter, with a pretty extensive vocabulary collected by Captain Tuckey, it appears,—1. That the languages of Angola, Congo, and Loango, are radically the same:—2. That they are nearly the same as those of the *Mandongo* and *Cambo* nations:—3. That all these are allied to the language of the nations on the coast of Mozambique, and to the dialect of the Caffres and Vetrjaanas.^f It follows irresistibly from these conclusions, that southern Africa has been originally peopled from one tribe; or, at least, that a constant and more or less intimate connexion subsists between its most distant nations.^g

The weapons of the Congos consist of an absurd mixture of bows, sabres made of hard wood, and some bad musketoons. They understand the mode of poisoning their arrows; their battle-axes have the form of a scythe, and must be formidable when wielded by a powerful arm. Some cover themselves with a shield, others with the skins of animals; there are some also who endeavour to give themselves a terrific appearance by painting their bodies with the figures of serpents and other formidable animals.^h The people of Loango, when marching to battle, paint the whole of their body with a red colour.

The indigenous superstitions of the Congos are too numerous to be all enumerated. They believe in the existence of some divinities called *Zambi*. The good principle is

fit of some one; *Salisionia*, to work for one other; *Salangana*, to be a skilful workman, &c. &c.

^b Zucchelli, p. 215. Oldendorp, 296.

^c Battel, 983. See hereafter, in the article, Madagascar, a description of the ordeal of the Tanguin, p. 4 2.

^d For example, in the dialect of Loango, we have *Salila*, to facilitate a work; *Salisia*, to work with some one; *Salisila*, to work for the pro-

named Zamba M'Poonga, and the evil principle which is opposed to him, Caddee M'Peemba; they are said to have some obscure notion of a future state wherein they shall all be happy. The images of these divinities they denominate *mokisso*, and keep them in their temples.^a The common objects, however, of their devotion, are different kinds of fetiches, or substances supposed to possess a divine power. This is sometimes a bird's feather, a shark's tooth; occasionally a tree, a serpent, or a toad; the horn, the hoof, the hair, the teeth of different quadrupeds; the beaks, claws, skulls, and bones of birds; heads and skins of snakes, shells, and fins of fishes; pieces of old iron, copper, wood, seeds of plants, and sometimes a mixture of all or most of them strung together. The vilest things in nature serve for a negro's fetiche; like the witches' caldron in European superstition, they are a compound of every abomination. In the choice of these they consult certain persons called fetiche-men, who form a kind of priesthood. The fetiche, however, is not merely an amulet; prayers, abstinence, and penances, are enjoined to its worshippers. The fetiche-man, it seems, can give another more propitious fetiche in exchange of that which is too insensible to the interests of its worshippers; and he has the lucrative power of rendering sacred, or *fetiching*, as it is named in Africa, any part of any man's property he pleases. This power is in all respects similar to the *taboo* of the South Sea Islands, and not unlike the once terrible *interdict* of the Roman Pontiff. In a word, the fetiche is an amulet, a deity, and a guardian genius; and the rudest sculptures or carvings which refer to it are held sacred. Hence the famous fetiche-rock, a huge mass of stone on the banks of the Congo, covered with miserable attempts at sculpture, is held in great veneration.^b Fetichism is doubtless one great cause of the ignorance and immorality of the Africans. The Capuchin missionaries saw them worship a goat, which their pious zeal caused to be killed; but the negroes, although converted, were, nevertheless, alarmed on seeing the Capuchins roast and eat a divinity.^c The priests are called *gangas*; their chief, called *Chitomé*, is supposed to possess a divine authority; he receives as a sacrifice the first-fruits, and a sacred fire is constantly kept in his inviolable abode. In the event of his becoming ill, his successor is appointed, who immediately kills him with a club, to prevent his dying a natural death; which would afford a bad omen. Many other subaltern pontiffs work upon the credulity of the negroes; one heals all diseases; another commands both wind and rain; others understand bewitching the waters, or preserving the harvest. Drought is the inherent vice of the climate of Africa, and the frequent destruction of the hopes of the husbandman which occurs from this cause, might have given origin to the function of "Rainmaker," among a less superstitious population. Mr. Campbell, an intelligent missionary, met with several men of this profession in the Betjuana country, where they are in high esteem, that district being very subject to drought. They are generally the best informed men of the community, and this explains why their lucrative office is frequently forced upon them, though protesting all the while that they are incapable of producing rain. Others seem seriously to believe they possess this power. To procure rain, an ox is killed; the fat of it is chopped and

mixed with different kinds of wood and leaves of trees: the whole are then burned. The secret of the business is to gain time by various artifices, until the rainmaker sees clouds arising in that direction from which rain generally comes. His reward is very considerable. The *N'quits* are members of a sacred fraternity, who celebrate dreadful mysterious rites, accompanied with lascivious dances, in the deep recesses of forests. One order of magicians, called *Atombala*, pretend to the power of raising the dead; their jugglers practising upon a dead body in the presence of the missionaries, so far imposed upon them that they imagined they saw the dead move, and believed they heard some inarticulate sounds proceed from his mouth, which they attributed to the power of infernal spirits. May not this have been a galvanic operation?

The Christian missionaries struggle with very little success against these monstrous superstitions. There was a time, when the apostles of the faith boasted of themselves among their flock all the princes of Lower Guinea, particularly those of Congo, and of having likewise assembled round the sign of the cross all their subjects. The negroes, in fact naturally fond of imitation, easily conform to the example of their chiefs. They embrace the religion which they are commanded to follow; but abandon it as readily whenever the prince, equally inconstant as the people, returns to his former mode of worship.^d Sogno attracted the favour of the apostolic missionaries, and seemed perfectly to justify the confidence entertained by its inhabitants. According to some accounts, he had embraced Christianity, and their example was followed by the whole of Congo.^e Faithful to the new religion, they still continued to abhor idolatry in 1776. They transmitted the Christian precepts and mysteries from father to son, and assembled regularly on Sunday to sing psalms, although for want of priests their children could not be baptized, nor could they themselves celebrate the holy sacraments.

In 1816, Tuckey found the Christian religion nearly extinct on the banks of the Congo. At Noki, the crucifixes left by the missionaries were strangely mixed with native fetiches, and no trace of the Portuguese missions appeared on its northern bank. Even at Shark Point, in the centre of Sogno, the number of idolaters seemed to predominate. The few who professed Christianity came on board, loaded with crucifixes, and satchels containing the relics of saints. One Sogno was a priest, having a diploma from the capuchins of Loanda. He and another man had learned to write their own names, and that of Saint Anthony, and could also read the litany in Latin. He had one wife and five concubines,—a proof that the Portuguese missionaries have found it necessary to relax on a point which was one great cause of their former failures. This barefooted apostle contended, that Saint Peter, in confining him to one wife, did not prohibit him from as many concubines as he pleased.^f In 1813, the Sognos killed several of the missionaries, and cut off a Portuguese trading pinnace,—a fact which sufficiently confirms the testimony of M. Grand-pré, given below.^g Perhaps the Roman Catholic religion is in itself not well adapted to spread the light of civilization: yet we find that, where its missionaries have had the education and habits of gentlemen, they have seldom

wanted success. The jesuits of China and Paraguay may be cited as examples ; and the failure in Congo may fairly be attributed to the rude ignorance and bigotry of the clergy, chiefly monks, who were employed in the mission. May they afford a warning to other more liberal churches, engaged in the same noble, but difficult pursuit !

Respecting the countries situated to the north of the Zaire, the French missionaries, who proceeded from Nantes to preach Christianity in Loango, finally made choice of Cacongo, in 1768, for the principal residence of their ministry. They immediately endeavoured to gain the chiefs, and were very well received. Strong in the protection of the king, who lodged them in his palace, they established a chapel, and had the satisfaction to witness the negroes of Sogno, whom trade had brought to Kingale, come to assist at mass. Sickness, however, obliged these priests, in 1770, to quit the country. Three years after, others arrived from France, who fixed their abode in a plain near the village of Kilonga. In 1775, they discovered, in their neighbourhood, a Christian community from Sogno, who had obtained permission from the king of Cacongo to settle in his states, where they put a desert country into a state of cultivation. This colony formed a small province, containing about four thousand Christians. Manguenzo was the principal village. The French priests baptized many children, and were well paid in yacca-root,^a maize, peas, and goats. Their intention then was to establish a seminary of negroes. Don Juan, the chief of the colony, was about to build two churches. They were in want of sacred vessels, and other objects of the first necessity. To fill up the measure of their misfortunes, many members of the mission died, and others found themselves loaded with infirmities, about the year 1776, when the last reports were transmitted to Europe. A modern traveller, however, contradicts these flattering accounts, and positively asserts, that the Sognos have not in any degree seconded the zeal shown for their conversion ;^b according to him, these savages, naturally treacherous and cowardly, have become notorious by the poisoning and assassination of the missionaries ; and their universal character for perfidy has sometimes caused them to be loaded with irons when sold to Europeans. A French priest, says M. de Grandpré, in another place,^c was zealous in the performance of his duty ; but the picture of eternal life, however brilliant he might paint it, did not attract the Congos. The abodes of paradise appeared to them the less desirable, from their being denied there the use of brandy ; they complained much of this, and preferred a voyage to France, where they might enjoy that precious liquor ; and thus the missionary was unable to make proselytes. At length, one of them, overcome by the entreaties of the priest, consented to compromise, and engaged to go to paradise ; inquiring at the same time, how much merchandize he should gain by it. "None, whatever," answered the priest. "Let us understand each other," replied the black ; "I ask you how much merchandize you will give me for performing the voyage which you propose." The missionary, with mildness, repeated his answer in the negative, adding, at the same time, every thing that he could to persuade him. The other replied in his bad French : "Hold you there ! Think that I will go all that way for

nothing ? Give me goods for it." The missionary insisted at least upon his being baptized, but he could obtain no other answer than, "Give goods, give brandy." This, continues M. de Grandpré, is not the only instance of fruitless missions. He was witness to one which arrived from Rochelle, in 1777 ; it was composed of four Italian priests, full of zeal, who proceeded to the district of the Sognos, well loaded with presents, and every thing which might insure success ; in fact, two of them succeeded in introducing themselves, and wrote to the two others, requiring them also to come and join them. In about ten days, says our author, I saw them return, full of terror, even doubting their own existence ; they were many days in recovering from their fright : and we learn that, on their arrival, they had found their two former companions poisoned, dead, and buried. They expected to have met with the same fate, and one of them, wholly resigned, thought only of administering to himself spiritual comfort ; the other, however, being younger, more spirited, and tenacious of life, contrived to deceive the blacks, by persuading them that he had left behind him the greatest part of the presents intended for them, which would not be delivered, except to the two missionaries in person. The negroes, though determined upon poisoning them in their turn, at the same time were anxious to be in possession of the presents, and furnished them with hammocks to return to the coast. Thus ended the mission. In a climate, however, which is naturally so hostile to European constitutions, the fate of these newly arrived missionaries may readily be explained, without having recourse to poisoning, of which the known frequency could not but alarm the terrified and ignorant imaginations of the two survivors.

In duly considering these circumstances, the blacks are not probably so much to blame, as, at first sight, might appear ; the missionaries often brought upon themselves an unfortunate termination of their ministry ; had they confined themselves to persuasion, had they permitted the fathers of families to finish their career in their own way, and had applied themselves solely to the conversion of the young, success might in time have rewarded their zeal. This was not the case ; they were able to speak only a very few words of the language of these people, and could, therefore, neither explain nor reason with them upon any subject ; they nevertheless began by imposing upon them the most sensible privations, by wishing to subject them at once to all the peculiarities of the most rigid worship. Polygamy is generally prevalent in a burning climate, where the temperament of the inhabitants renders physical enjoyments necessary. Many missionaries have been known to employ force to deprive them of their wives ; and as persons in power generally afford examples for others, it was upon these that they first attempted to exercise their apostolic authority. What attachment could they expect from men guided by simple nature, who considered them as persons merely come to torment them, to impose upon them habits of slavery ; who only addressed them in the language of reproach, and were even willing to bring down upon their families trouble and confusion, by compelling them to repudiate their wives, and deprive their children of mothers.

It now remains for us to make a few observations on the

^a Manioc.

^b De Grandpré, t. II. p. 37.

^c De Grandpré, t. I. p. 91.

tribes altogether savage, which are to be found on the borders of Congo.

To the north-east of Loango, the earlier travellers place a nation of dwarfs, called *Matembas* or *Bake-Bake*. They are said, by them, to be of the size of children of twelve years old, but very stout; and to live in the interior of unfrequented forests, where they hunt elephants, the teeth of which they pay as a tribute to a prince called *Many Kesock*, who lives about eight days' journey to the east of Mayomba. Their women go into the woods to kill the great pongo monkeys with poisoned arrows.^a The name, Bake-Bake, is deserving of particular attention; it would seem to be identical with that of *Vac-vac*, or *Wak-wak*, which the Arabian writers, Masudi and Edrisi, give to a country which borders on *Sofala* and *Zanguebar*, and which consequently must include a part of central and southern Africa.^b In the interior, and more towards the east, is the country of *Anziko*, or *Anzikana*, *N'teka*, or *Great Angeca*,^c rich in metals and sandal-wood, but particularly famed for the barbarous state of its inhabitants. According to accounts probably fabulous, or at least exaggerated, of this distant and little known country, the *Anziquas* or *Anzi-quois*,^d deliver their sick prisoners to butchers, who expose their flesh for sale in the public markets. The natives, when tired of their lives, or misled by a false point of honour, are said sometimes to offer themselves for slaughter. Even parents and children devour each other. M. de Grandpré would appear to doubt this report; he even denies that there are in Africa any Anthropophagi. If the travels of Mungo Park, in countries where Mahometanism has reached, do not altogether refute the imputation of cannibalism, thrown out against the Africans, what can be said against the testimony of Levaillant, whose steps have been directed towards nations altogether barbarous, entire strangers to every species of civilization, and among whom he has not found any thing to justify an accusation so unjust? I can certify, for my own part, that the report of the blaeks of Congo eating human flesh, is false; these people are mild, timid, and indolent; they, in general, have a horror at the shedding of blood, and any man among them who wounds another to this extent, is condemned either to give a slave, or its value in merchandize; and if the aggressor has not the means, he is himself sold."^e

^c Battel, 981; Dapper, 553; Froyart, 8.

^d Anzikos.

The *Anziquas* are excellent archers, and handle the battle-axe in a superior manner. They are very nimble, courageous, and intrepid. They are considered faithful in their transactions with others. They sometimes carry for sale to the coast fine stuffs made of palm leaves and other materials, fabricated by them, also ivory and slaves, either procured in their own country, or in Nubia. The merchandize which they take in return consists of cowries and other shells with which they ornament themselves, salt, silk-stuffs, linen, glass ware, and other European manufactures. Circumcision is performed on both sexes, and they scar their faces as an ornament. The women are covered from head to foot; the great wear either robes of silk, or coats of cloth; the upper part of the body, among the common people, is naked, and their hairbraided. Their language is harsh and difficult, and appears to be merely a dialect of the common idiom found throughout the whole of lower Guinea.^f

The extent and situation of *Anziko* has been so indicated as rather to excite the curiosity of the geographer than to satisfy it. Dapper places *Mansol*, the capital, three hundred leagues from the coast, and describes the country as bordering on *Gingiro*, which is near Abyssinia. Pigafetta makes a river called *Umbre*, which enters the Congo, to flow in *Anziko*;^g he places towards the east or north-east the kingdom of *Wangua*, in which one might be tempted to discover *Wangara*. The king of *Anziko* is called the *Makoko*; under his government are thirteen vassal kings, among whom may be remarked the king of *Fungeni*, because this name recalls to mind the *Fungi* of Nubia, who, according to their own traditions, originally came from the southern parts of Africa.

The missionary Ockendorp, from inquiries made of the negroes of the West Indies, learned the existence of a nation called *Mokko*, bordering on the *Ibbos*, which may be identical with the inhabitants of *Anziko*, subjects of the *Makoko*. This nation lived in perpetual hostility with the *Evos*, who appear to be the same as the *Evis*, of whose existence Mr. Salt heard accounts at Mosambique, as inhabiting a country nearer the Atlantic than the Indian Ocean.

BOOK LXX.

AFRICA.

Continuation of the description of Africa.—The Cape, and the country of the Hottentots.

The coast which extends from Cape Negro to the mouth of the united *Orange* and *Fish* rivers, 150 miles S. E. of *Angra Pequena*, is little known, of dangerous access, and scarcely inhabited. The Portuguese make Cape Negro in proceeding from Brazil to Benguela, and upon its point they have erected a marble column bearing the arms of Portugal. To the south of the Cape, the river *Bemba-Roughe*, half a league wide, empties itself into the sea; both its banks are inhabited. Cape *Rui-Pirez* still bears the surname *das Neves*, or of snows; this epithet, however, has originated from hillocks of white sand. Cape *Frio*, or cold cape; *l'Angra Fria*, or cold creek; also *la Praya das Neves*, or shore of snows, owe likewise their names to illusions or impressions of the moment. The high mountains terminate at Cape Serra. Many peaks of small elevation line *Walvisch* bay, or the bay of Whales, which appears to be the same as the *Angra do Ilheo* of the Portuguese. Little more is known of the small gulf of St. Thomas. The whole of this coast was visited in detail, more than twenty years ago,^a by an English expedition, with a view of selecting a place for transportation; they did not find one spot favourable for cultivation, or which did not appear too wretched even for criminals. Water that can be drank is very scarce; the rivers at their mouths have nothing but brackish water; and traces of verdure are only to be seen in partial situations.^b

Behind this inhospitable coast is marked the wandering horde of *Cimbebas*, whose prince is called *Mataman*, and that of *Macasses*, or rather *Makosses*, visited by a French traveller, whose narrative is very scarce.^c The existence even of the *Cimbebas* rests upon very doubtful authority. They appear, however, to be known by the *Makosses*, under the name of *Maquemanes*. The country of the *Makosses* has an extent of 30 leagues; hares are here so numerous that they may be killed by a stick. Horned cattle constitute the riches of these wanderers, who generally change the pasturage every two years, and who have no other clothing than the hide of an ox.^d They are circumcised at the age of eighteen, do not eat fish, and believe in magicians, in poisoners, and in an evil genius, who sends them rain, thunder, and storms. The sweet seeds of a plant which grows rapidly to the height of ten or twelve feet, are used by them to make a sort of cake; another

seed supplies them with an inebriating drink. The *Macasses* appear to enjoy the conveniences of life; those who have two or three thousand head of cattle are not considered rich. Theft is punished by them very severely. There is great decency in their external appearance. Every thing leads us to conclude that this tribe is a branch of the *Betjuanas*, or of the *Koussa Caffres*, who inhabit the eastern coast.^e Having passed the common opening of the *Fish* and *Orange* Rivers, we enter the country of the *Hottentots*, comprehended between the *Orange* and *Koussie* River; which, together with the territory of the colony of the Cape, forms only one *physical region*. The territory of the Cape of Good Hope has for its limits to the north and north-east, a vast chain of mountains, called the *Nieuwveld*, and *Roggeveld*, which separate it from the *Betjuanas*, *Bushmen*, and other independent tribes; to the east, the *Great Fish* River, the *Rio d'Infante* of the Portuguese, which separates it from *Caffraria*; to the west, the *Atlantic Ocean*, from the mouth of *Koussie* River, to the promontory of the Cape, or more properly to Cape *L'Aguillas*, about thirty miles farther south; and from hence again to the *Great Fish* River, its southern boundary is fixed by the waters of the *Southern Ocean*. Such were the limits assumed at the cession of this country to the English by the Dutch in 1806; but it appears that some circumstances connected with the attacks of the *Caffres*, have occasioned the eastern boundary of the British settlement to be advanced to the river *Keiskamma*,^f about thirty-two miles to the N. E. of the *Great Fish*. We design, however, under the *physical region* marked by the mouths of the *Orange* and *Great Fish* Rivers, to comprehend also the description of the interior, as far as is known; and what we are about to deliver may probably apply, not only to all the countries south of *Congo* and *Monomotapa*, but also to the whole plateau of *Mocaranga* and the deserts of the *Jagas*; further observation must decide this question.

The northern parts of this region of the Cape are watered by two large rivers, the lesser *Fish*, and the *Gariiep*, or *Orange*. The *Orange* may be said to commence at *Campbell's Dorp*, 600 miles directly east from its mouth; being formed there by the confluence of the *Yellow River*, which arises among the mountains at *Khing* and *Yattaba*, two sources, at least 350 miles to the N. E. of *Campbell's Dorp*, and 800 miles from the mouth of the *Orange*;—the

Arrowsmith, or *Malalareen* River, the *Alexander*, the *Cradoc*. Formerly the *Krooman* River fell into the Orange 360 miles nearer its mouth; but it is now a dry bed. Mr. Campbell, in 1820, met with natives who remembered its flowing much farther into the desert. The free Hottentot country between the south bank of the Orange, and the *Koussie*, is called the Little *Namaqua* territory, whilst the region adjacent to its north bank, named the Great *Namaqua* territory, gives origin to the *Konup*, or *Fish* River, by many tributary streams which issue from its *Copper mountains*. The course is nearly south; it has been traced about 300 miles north from the point where it falls into the Orange to the country of the *Dammaras*. The western *Elephant*^a and *Berg* Rivers flow from east to west, but they issue from sloping declivities (terraces) near the western coast. Some other rivers, which run from north to south, issue from the sides of sloping declivities;^b their course is not long; the Great *Fish* River (*Groote Visch*) terminates the territory of the Cape. All these rivers, swelled by the periodical rains, carry along much mud and sand; forced back by the sea, these matters form bars at their mouth; or, in the dry season, these rivers, reduced to a small body of water, are lost in the sands, or among the rocks.^c Cascades, but little picturesque, interrupt the course of these rivers, which are only useful in fertilizing, by their inundations, a part of their banks.

Between the sloping declivities (terraces) improperly denominated chains of mountains, there are extensive plains destitute of running water, called *Karroos*. These plains are not wholly barren deserts, as represented by inaccurate travellers. Of these *Karroos*, the one best known, which is bounded on the east by the hills of *Camdebo*, has been described by two accurate observers, *Patterson*,^d and *Lichtenstein*.^e The soil of the *Karoo* is a bed of clay and sand, having the colour of yellow ochre from particles of iron: at the depth of one or two feet is found solid rock, of which this bed appears to be a decomposition. During the dry season, the rays of the sun reduce the soil nearly to the hardness of brick; fig-marygolds,^f and other fleshy plants, alone retain the remains of verdure; the roots of the *gorteria*, *aster*, and *berckheya*, as well as the bulbs of lilies, defended by an almost ligneous covering, scarcely survive under this sun-scorched crust. These roots, nourished by the rain in the wet season, swell under the earth; the young shoots develop themselves, and rise all at once, covering the plain, a short time only before so dry, with a bright verdure; very soon the lilies and fig-marygolds display their brilliant colours, and fill the air with the most exquisite perfumes. At that time, the nimble antelopes and the ostrich descend from the neighbouring mountains in great numbers. The colonists lead down their herds from all points, which acquire new vigour in this rich pasturage. The possession of these natural meadows is not disputed; they are sufficiently extensive for the purposes of every one. The colonists, indeed, seek the conversation of their companions, and endeavour to draw closer the bonds of friendship and affinity to families from whom they are separated at other seasons by immense distances.

^a There is also an *Elephant* (*Olifants*) river on the south coast, a branch of the *Ganritz* river.—P.

^b "They issue from the sides of the last or outermost terraces of the great plateau of S. Africa."—P.

^d *Patterson*, *Voyage*, trad. de *Forster*, 40.

^e *Lichtenstein*, *Voyage au Cap*, I. 193

The life of the *Karoo*, is a representation of the golden age for the people of the Cape. Only slight labour interrupts its uniformity, and renders it more lucrative; the children and the slaves collect the branches of two shrubs, called *channa*,^g from which potash is extracted. The adults are employed in tanning hides for clothing and shoes. The beauty, however, of the *Karoo* lasts only one month, unless some lingering showers continue to protract vegetable life. The sun's rays, during the month of August, on account of the increasing length of the day, have a destructive influence: the plants become dried up, the soil is hardened, and on all sides the desert reappears. Men and animals soon abandon these situations, henceforth uninhabitable. Such vegetables as the *Atriplex albicans*, and the *Polygalas*, which resist their influence, become covered with a gray crust; a powder of the same colour is spread over the fleshy plants, which continue to be nourished by the air. Every where is seen a parched soil, covered with a blackish dust, the only remains of vegetables dried up. It is thus that life and death succeed each other here in eternal rotation.

The mountains of this extremity of the African continent, are, as has already been observed, enormous declivities;^h they are the sections of those terraces by which the central plateau descends towards the sea. The direction of these mountains is generally from north-west to south-east; their termination is more abrupt towards the west and south than towards the east, where, being continued under the waters of the ocean, they form dangerous reefs. These mountains constitute the leading feature of the Cape territory. They consist of three successive ranges, parallel to each other, and nearly so to the southern coast, which trends to the north. The first range, *Lange Kloof*, or *Long Pass*, at the distance of twenty to sixty miles, runs parallel to the coast, widening as it proceeds towards the west.ⁱ The second, named *Zwarte Berg*, or *Black Mountain*, is considerably higher and more rugged, consisting often of double or even triple ranges. The belt of land interposed between this ridge and the former is nearly equal to that between the former and the sea; at an average, from twenty to sixty miles. It is, however, of considerably greater elevation. Beyond, namely to the N. W. of the *Zwarte Berg*, at an interval of 80 or 100 miles, soars the lofty *Nieuwveld's Gebergte*, the highest range of southern Africa, the summits of which, as it is said, are generally covered with snow. It must be confessed, however, that the intense light of this climate, reflected from the white clouds that often crown these distant summits, may frequently become a source of error.^k The greatest height of the *Nieuwveld's Gebergte* has not been measured, but has been supposed not less than 10,000 feet. The belt or plain between this, the *New-land Mountain*, and the *Black Mountain*, is considerably higher than the two above described, and hence we have said that Southern Africa presents a succession of terraces, from which its rivers descend to the sea. The plain next the latter is covered with a deep and fertile soil, watered by numerous rivulets, well clothed with grass, and a beautiful variety of trees and shrubs. Rains are frequent,

^g *Mesembryanthemum*.

^h *Salsola aphylla* and *Salicornia fruticosa*.

ⁱ "Falaises," bluffs.

^j Properly, it is the range next the S. coast, at a greater distance to the west, and approaching it as it runs east.—P.

^k *Campbell's Second Journey*.

and from this circumstance, the irrigation of its rivulets, abundant vegetation, and proximity to the sea, it enjoys a more mild and equable temperature than the other plateaus of the colony. The second pass, or terrace, contains a considerable proportion of well watered and fertile lands; but these are mixed with large tracts of arid desert, called Karroos. The third belt is named the Great Karroo; because, like the smaller, its soil is of the hard impenetrable texture we have just described; a vast plain, 300 miles long, and nearly 100 in breadth, without almost a trace of vegetation. Granite, which, on the western coast, is only found at the height of one hundred and fifty feet above the level of the sea, is found on the banks of the Kaiman river at fifty feet: flinty slate,^a which is met with only at the height of two hundred and fifty feet near the Cape, is continued into the sea on the shores of the bays of Plettenberg and Algoa.^b Sand-stone forms chains of great extent, among others the *Picquet Mountains*, in which the most elevated beds having been broken and cut assunder by some physical revolution, gives an appearance of towers and embattled walls. The shore of Table-Bay, from which the Table Mountain rises to the height of 3582 feet, by a declivity so gentle that it has been ascended on horseback from the south, is supported by a bed of ferruginous schist, in parallel furrows, in a direction from south-east to north-west, interrupted by veins of granite and quartz. Above the schist is a bed of ochrous clay, containing particles of brown mica; this proceeds from the decomposition of granite, which is found imbedded there in immense blocks, even at the height of five hundred feet above the level of the sea; then commence stratified rocks, composed of various kinds of sand-stone, traversed by veins of hematite. These beds of sand-stone support a mass of quartz a thousand feet high, grayish, shining, crumbling into powder, or degenerating into Sand-stone, according to the exposure. The mountain has no trace of shells, impressions, or petrifications.^c No lime-stone has hitherto been found. Iron ore is found in many places,^d but it has not been worked. Since the year 1685, Europeans have been acquainted with the rich ores of copper slightly worked by the Dammara Hottentots, which have given their name to the *copper mountains*.^e Springs of petroleum are frequent; the richest lands are often so much impregnated with nitrous salts, and so much covered by a crust from the efflorescence of these salts, as to be rendered unfit for cultivation.^f Common salt, equally abundant, is more useful to the inhabitants; they call the basins wherein the briny waters are collected, salt pans, (*sout-pan*.)

In the interior of the colony are found various mineral waters, of which the most esteemed are those called the hot baths; these are found near the Black Mountains,^g thirty leagues from the city. A spacious building has lately been constructed for the convenience of those who use the baths; it is divided into two parts, the one set apart for the whites and the other for the negroes.^h Another is described to the north of Orange River.ⁱ

^g Zwartberg.

The country whose soil we have just described, enjoys the mildest temperature in respect to the heat. Fahrenheit's thermometer seldom rising above the hundredth degree. In a meteorological register^k kept at Cape Town, from September, 1818, to September, 1821, embracing a period of three years, the highest heat marked is 96°, the lowest 45°, Fahrenheit. The mean annual temperature scarcely 68°.—Of winter 61°, of summer 89°. Of the warmest month 79°, of the coldest 57½°, Fahrenheit. In short, it corresponds as nearly to Funchal, the capital of Madeira, in climate, as it does in latitude and longitude, though in an opposite direction. The mean annual temperature is the same; only the winters are something colder, and the summers warmer, at the Cape than in Madeira.^l Hence the Cape has, with great propriety, been named the Madeira of the southern hemisphere, and is a celebrated resort for the invalids of India, who frequently retire from this salubrious climate, with full renovation of their health and vigour. It may be doubted if so exact a correspondence between the isothermal curve, and the identical parallel of latitude in opposite hemispheres, is to be found any where else without the tropics. The barometer ranges from 29.6 to 30.54.—mean 30.18. Although the temperature is so mild, the winds produce very disagreeable effects. The season which is here called summer, continues from the month of September until the end of March; the wind blows from the south-east, and often with great violence. Nothing can be secured from the sands which it drives before it; they penetrate the closest apartments, and the best closed trunks. At this time it is not prudent to go out without glasses, lest the eyes should be injured. These winds begin soon after the Table Mountain is observed to be covered with a mist, which is called its mantle; they generally last four or five successive days, and are very distressing. From March to September, the north-west wind prevails; it is accompanied by rains, which are almost constant during the months of June and July. In different parts of the country the meteorological phenomena are much varied, according to the direction and height of the mountains of the interior. The higher chains of mountains attract the clouds.^m In the country of Houtiniqua,ⁿ on the south-east coast, during the month of October storms of rain are frequent, accompanied with dreadful peals of thunder.^o

The enthusiasm of botanists, excited by the great number of new plants furnished by the Cape, has represented the vegetation of this country in brilliant colours. The philosopher, it must be admitted, finds more wonders to admire in this, than in any other country; it is from hence that we have received the most magnificent plants that adorn our greenhouses and gardens; many others, however, not less beautiful, continue strangers to European culture. The class of bulbous plants may be considered as one of the most characteristic of the Cape flora; since no where else are they to be found so numerous, so various, and so beautiful. The botanist may here admire the

^o Thunberg, t. I. 165.

numberless varieties of the *Ixia*, their brilliant colours, and exquisite scent; he will find it difficult to count the superb species of the iris, the moræa, the corn-flag, (*gladiolus*,) the amaryllis, the *hæmanthus*,^a and the *pancratium*, which, after the autumnal rains, embellish the fields and the foot of the mountains. During the other seasons, the *Gnaphalium*, and the *Xeranthemum*,^b display their red, blue, or silky white flowers; the sweet smelling *Geranium*, and a thousand other plants and heaths, vary this rich scene. Even in the midst of stony deserts are seen fleshy plants, the stapelia, the *mesembryanthemum*, the euphorbia, the crassula, the cotyledon, and the aloe. Some attain the height of trees, which, together with the weeping willow, or the different species of *Mimosa*, shade the banks of the torrents produced or enlarged by the rains. The silver-leaved protea imparts to the groves of the Cape a metallic splendour, while one of the numerous species of heath,^c gives the appearance of a carpet of hair. The Cape olive-tree, the sophora, and a tree like the ash,^d furnish some wood for joinery, but they are in want of building and fire wood. "Nevertheless," says a Frenchman who has visited the Cape four times successively, "forests of magnificent oaks exist on the east side of False Bay, in that part called Hottentot-Holland. The English builder-general at the Cape, and my friend Camille Roquefeuil, from whom I have received this account, have examined this wood with minute attention, and consider it the same as the Albanian oak,^e which, as is well known, is the best for building; on account of its quality and durability. If at some future period they should cut down these forests, the Cape will readily find a market for its woods; our islands will no doubt avail themselves of it for building and repairing ships."^f It is towards the east in particular, on the frontiers of the settlement, that forests are found. They have not yet been accurately examined. They furnish iron and hassagay wood, yellow wood, some species of zamia or sago palm;^g the guaiacum with scarlet flowers,^h and the *strelitzia-reginæ*, of incomparable beauty.

Such are the vegetable beauties of the Cape. It is true that the visit of every naturalist enriches science with some new species of shrub or plant; and the researches of M. Lalande in 1819, 1820, at the expense of the French government, are expected to add an immense catalogue to the individuals already known,ⁱ it must, however, be frankly acknowledged, that the vegetation of this African country does not satisfy either the eye or the feelings of an European. Rocks and sands every where prevail. The fields are separated by deserts; the green turf, scattered and thin, no where presents a close bed of verdure; the forests, filled with pointed trees, possess neither a delicious coolness, nor a solemn darkness. Nature is here more imposing than beautiful: she has more caprices than charms; and a plant, however elegant, when arranged neatly in the green houses of Europe, cuts a very different figure on a solitary mass of sand and clay, the general soil of the Karroo. Nature is said to divide her favours; and for the elegance of colour and structure which she has lavished on the Flora of the Cape, to have withheld that sweetness whose aroma

fills the gardens of Europe. Hence it is a common saying,^k "that in South Africa flowers have no smell, birds no song, rivers no fish;" the latter part of the remark is not quite correct; but it explains why the Dutch have bestowed the appellative of *Fish*, and *Great Fish*, on the two rivers which bound the territory. May not this inadequacy of the Cape sun to sublime the volatile and aromatic juices of vegetables, explain in some measure the acknowledged general inferiority of Cape raisins, wine, and brandy? The singular gratefulness of the Constantia wine is almost solely referable to a favourable peculiarity of situation.^l

It is to be lamented that the English government at the Cape have suffered the fine Botanic garden, and menagerie, established there by the Dutch, to fall into total decay. By encouraging the indigenous botany of South Africa, inestimable advantages might accrue to the agriculturists of the Cape, and the useful knowledge reflected from it to the mother country would amply repay her, should this rich colony be found unable or unwilling to support the establishment.

Culture has introduced many European plants. The vine, which was originally brought from Madeira, produces here an excellent^m wine. The plants of the muscadel vine brought from the south of France thrive well; the Frontignac and Lunelle wines procured from the Cape, are nearly equal in flavour to those from which they originate; finally, the famous Constantia, which is produced from plants originally brought from Shiraz in Persia, possesses a flavour not found in any of our wines. The pontac of Constantia is pure ambrosia; it is far superior to French pontac, which our connoisseurs nevertheless admire.ⁿ If the inhabitants of the Cape better understood their interest, and would abandon their beaten tracks, they would much increase the high character of their wines, and this colony, agreeable to Banks' plan, might become the great vineyard of England.

The Constantia wine, already so exquisite, does not seem susceptible of much improvement, but the other varieties, sold in England to the amount of 5000 pipes per annum, under the appellations of *Cape wine*, and *Cape Madeira*, have an earthy taste, a dilute flavour of muscadel, and in most instances, an undisguised taste of brandy. The first fault is said to be derived from the argillaceous soil on which the vine stocks grow, and with which the grapes may occasionally come in contact. It is never met with in wine produced from a soil of decomposed feldspar, and most probably is proportionate to the quantity of clay in the soil of the vineyard; but the sole cause of this, and the other vices, being found so generally in these wines, is the avarice or mismanagement of the Cape merchants, who vainly endeavour to correct them by mingling up all sorts together with a large addition of their wretched brandy. So great has been the depreciation of these wines from this cause, combined with over production, that the 6909 pipes of wine, which were the annual produce of 1806 for exportation, were actually worth more than the 10,000 pipes of 1821. The whole colony is computed to grow 22,400,100 bearing vines, equivalent to 21,333 pipes, and to be easily

capable of producing double this quantity; but as the colony alone consumes above 6500^a pipes annually, and the population has increased above one half since 1806, namely, from 75,145, to 116,044, the present dismay of wine merchants and planters, from the low prices, must speedily be removed, by the rectifying influence of a demand increasing so much faster than the supply. That over production is the chief cause of the present depression, is sufficiently demonstrated by Constantia wine having fallen nearly in the same ratio, (from 200 to 150 rix-dollars, the nineteen gallon cask,) as the other and faulty wines of the Cape. Of these there are no less than 150 varieties known, though all proceeding from no more than eleven different species of the vine.

It is pleasant to observe, among the numerous gardens surrounding the city, the fruits of Europe growing by the side of the fruits of Asia; the chestnut, the apple, and other trees of the coldest countries, with the banana, the jambosade,^b and many other trees of the torrid zone. The learned M. Poivre mentions having seen^c at the Cape the palm and the camphor tree of Borneo; he even speaks of these trees having been propagated there; we are assured, however, that none exist there now, yet without being told whether their culture has been attempted. The fruits of Europe, such as cherries and apples, have somewhat degenerated; but figs, apricots, almonds, and oranges, are as delicious as in France. The fruits of India are more rare; the maraka^d and the pine-apple are wholly unknown. Vegetables grow well; all those of Europe are to be found, and even the artichoke, although Levaillant declares he had never seen it; wheat, barley, and oats, are successfully cultivated; rice does not grow there. Its cultivation was formerly tried in the environs of the Bay of St. Helena; but the attempt was fruitless; the yacca root is also unknown. Olive trees have been transported to the Cape; they did not immediately thrive, and the inhabitants have not made any further attempts. The cultivation of cotton has been tried; the south-east winds, however, cause the sand to penetratê the pods, and give it a yellow colour. Two species of wild indigo are found at the Cape; they appear never to have attempted its preparation; the cultivation of that of Bengal was tried, and abandoned. Flax yields two crops in the year, and hemp is abundant; but they have not yet attempted to make either linen or cordage. The Dutch East India Company had attempted latterly the culture of tea, and had tolerably succeeded; the English, it is said, have destroyed all the shrubs, to prevent their commerce with China being injured. Late authors again advise its cultivation.^d

Here, as in all other situations, the wild beasts have retired before man; lions are seen only near *Sunday* River; the deserts, however, even in the vicinity of the Cape, resound with the howling of wolves and the bellowing of hyænas. The jackal of the Cape^e and the tyger-cat^f are also common. A particular species of badger^g is observed.^h

^h *Hyrax capensis*.

ⁱ *Hystrix cristata*.

The mangouste of the Cape^k and the jerboa,^l are scattered through all these countries. The hunters of the Cape pursue the numerous species of antelopes. The most beautiful of them all, the *pygarga*,^m is so common near Fish river, that herds of more than two thousand may sometimes be seen together. The blue antelopeⁿ is rare; the *gazelle*, properly so called,^o is one of the most common: the *pasan* is found in the north-west part of the colony; also the *gnoo*, the wood antelope,^p the *condoma*,^q and others. In the forests of the interior are found many species of baboons. Among the animals of this country may be observed the *Orycteropus*, or the *Myrmecophaga capensis* of Gmelin, named by the Dutch, ground hog; this animal feeds entirely on ants, and is larger than the ant-eaters of America, from which it differs sufficiently to constitute a different genus. Zebras, and quaggas larger and stronger than Zebras, move in separate troops; they are two distinct species, that never mix promiscuously. They are become very rare in the colony. The elephants have also forsaken the districts inhabited by Europeans, except the canton of Sitsikamma: the two-horned rhinoceros shows itself still less, and the gentle giraffe seeks the more secluded deserts.

The wild buffaloes are hunted by the Hottentots and the Caffres, whose herds are in a great measure composed of tame buffaloes, Barbary sheep, and goats; the cattle are small and bad. Sparrman first recognised a particular species in the ox or buffalo of the Cape, which he called *bos cafer*; it is distinguished by enormous horns, small head, a natural ferocity, and other characters; it is probably widely dispersed in the interior of Africa. In Abyssinia a breed of oxen with very large horns is known.^r The savage nature of the Caffree ox recalls to mind the *carnivorous bulls*, which all the ancients, since the time of Agatharchides, have placed in Ethiopia; and their horns, often singularly distorted, remind us of the oxen of the Garamantes, described by Herodotus and Alexander of Myndus, as compelled to walk backwards while feeding, on account of their horns turned towards the earth. The wild boar of this country is, like that of the whole interior of the south of Africa, the *Sus Æthiopicus*.

The ostrich is found in the deserts of the interior, and sometimes comes in troops to lay waste the fields of corn. M. Barrow states his having killed a very large condor. The flamingos display their scarlet plumage in every direction. We must further enumerate the loxiæ, which construct their nests with wonderful art, and the *Cuculus indicator*, which points out to man the concealed asylum of the laborious bee. We shall not detain our readers with M. Le Vaillant's account of birds, because it is considered merely as the work of imagination. The poultry, hogs, and other European animals which abound in this colony, have been imported by the Dutch. The horses also, which are at present very common, have likewise been transported by them from Persia. This country partakes, with the

^k The *Hystrix cristata* is the common porcupine. *Mangouste* is a name given by the French naturalists to the ichneumon, and certain species allied to it. Among these is the mangouste of the Cape, (*Viverra cafer*.) These species have been recently formed into a separate genus, (*Mungo*).—P.

rest of Africa, the inconvenience of being exposed to the invasion of locusts. The south-wind drives away these destructive visitants.

The Hottentots, the original inhabitants of this country, appear to be a race distinct both from the negro and the Caffre. A deep brown, or yellow-brown colour, covers their whole body, but does not tinge their eyes, which are of a pure white;^a their head is small; the face very wide above, ends in a point; their cheek-bones are very prominent; their eyes sunk; the nose flat; the lips thick; the teeth very white; the hand and foot small in proportion to the rest of the body; they are straight, well-made, and tall: their hair black, and either curled or woolly; they have scarcely any beard. In many tribes, the hair does not cover the whole surface of the scalp, but rises in small tufts, at certain distances from each other, resembling the pencils or teeth of a hard shoe-brush, only it is curled and twisted into little round lumps. Suffered to grow, it hangs in small tassels, like fringe.^b The women actually have the deformity known by the name of the *apron*, already described by an early traveller, whose authority is very unjustly doubted.^c In some of their external characters they resemble the Mongolian race more than any other known African nation. The Hottentot language, unfortunately little studied, has furnished us with some very remarkable affinities to the small number of Mongolian and Kalmuck words which we have seen.^d This unexpected and surprising observation, might lead to very singular conjectures. Mr. Barrow, as well as M. de Grandpré, having observed in the Hottentot the Chinese or Mongolian eyes, immediately conceived they might be a colony of Chinese. It is necessary, however, before forming any conjecture, that the tribes of the central plateau of Southern Africa should be well known, as among them may be found a race, similar to that which we are now engaged in describing.

The Hottentots are divided into several tribes. The *Dammaras* occupy the most northern part. Their country begins beyond the *Copper mountains*, and reaches to the 21st degree of latitude, or as far as the country of the *Makosses*.^e The *Great Namaquas*, united under the patriarchal authority of the missionary Anderson, have ascended the banks of the Orange river, in a north-eastern direction. The *Little Namaquas* are found to the south of the same river, on the banks of which, shaded by mimosas, elephants, lions and giraffes, are found in considerable numbers.^f The *Kabobiquas* and *Geissiquas*, appear to be branches of the Namaquas. The *Koranas*, or *Kora-Hottentots*,^g occupy a central country, of great extent, and rich in pasturage; less filthy than the other tribes, they shew in their buildings and dress some tendency to civilization. A vast desert or *karroo*, protects their independence from Europeans.^h The Koranas have a

great predilection to follow the course of the Orange river, and their chief towns are to be found, says Mr. Campbell, along its banks. Towards the S. E., on the eastern limits of the colony, lived the now extinct *Gonaquas*, or *Channaquas*, a tribe distinguished by handsomer features, and a more enlarged understanding. Many other tribes, named with precision by the earlier observers,ⁱ have disappeared in proportion as the colony has invaded their districts. The descendants of these extinct tribes live among the Dutch in a sort of slavery, more or less mild, according to the caprice of their masters.

Covered by the skin of the sheep, the antelope, or the lion, besmeared with grease of a black or red colour, and armed with a short club, the savage Hottentot, singing and dancing, wanders about in the midst of the herds which form his riches. Their primitive manners are somewhat changed, from their proximity to Europeans. Thus we may believe, with Kolben, that formerly all the Hottentots deprived their children of a testicle,^k although, at present, this custom appears to exist only among the Koranas and Bushmen.^l If Kolben has exaggerated in accusing them of eating those disgusting insects with which their hair is filled, it nevertheless appears that they are fond of eating a similar insect, which is found among the hairs of horses and oxen.^m The most whimsical custom mentioned by the first historian of the Hottentots, is the ceremony by which a magician or juggler sanctifies the union of new married persons, by sprinkling them with a warm and impure water;ⁿ its truth is avowed by modern observers of the greatest credit;^o it is by the same operation that a youth of eighteen years of age is initiated into the society of his elders. The temperament of the Hottentots estranges them from polygamy; they have a horror of incest and adultery. The widow who wishes to marry again, is obliged to lose a joint of one of her fingers.^p They are said not to have any idea of a divinity; they nevertheless deliver themselves up to the operations of sorcery, and look upon a species of mantis^q as a sacred animal, or even as a god.

The *Boschmen*,^r or Bushmen, who by the Koranas are called by the indigenous name of *Saabs*, appear to be a branch very anciently separated from the Hottentots.

The Saabs are incontestibly found in the last extreme of degradation to which human nature can be brought; a wild, unsteady, sinister aspect; confused, sluggish, and insidious features, a visible embarrassment in their manner of acting when in the presence of other men, announce, at first sight, the depravity of their mind. Their excessive leanness renders the peculiar characters of the Hottentot race very conspicuous in their whole figure. The natural yellow colour of their skin is observable only under their eyes, where their tears, excited by the smoke of the fire, round which they like to squat, sometimes wash off the

p. 286. (Spite of every attention, the position of this tribe is laid down too narrow in our chart of Southern Africa.)

coating of grease and ashes which covers the whole body. Nevertheless, compared with the women, the men may in some measure be considered handsome: flabby breasts, hanging and elongated, a back hollow, incurvated, and lean like the rest of the body, contrasted with the hips, which are swelled, and so prominent that, as in the African sheep, all the fat of the body appears there concentrated, concur, with the ugliness of their face, and their general form, to render these women absolute objects of horror to Europeans.^a The amputation of the first joint of the little finger is considered either as a remedy^b or a useful charm against diseases and misfortunes. The sting of the scorpion, very dangerous in this country to every other person, has no effect on these savages. Arrayed generally with a bow, a quiver full of arrows, a cap and a belt, leather sandals, a sheep skin, a gourd, or the shell of an ostrich's egg to carry water, with two or three grass mats, which, when extended upon sticks, form their tents, and sometimes followed by spaniels, these unfortunate beings lead a most deplorable life, rambling alone, or in small parties, in the burning deserts that bound the colony on the north. They there chiefly live on roots, berries, ant-eggs, larvas, locusts, mice, toads, lizards, and the refuse of the chase left by the colonists. Their arrows are always poisoned. The strongest poison used by them is taken from the bags which contain it under the lower jaw of the yellow serpent. The substance thus obtained soon hardens; it is pounded with the red stone used to paint their bodies, and when the juice of the *Illiteris* bulb has been added, with the compound they prepare their arrows.^c It is not necessarily, though often, fatal.^d

Sometimes beggars, at other times thieves and brigands, always cowardly and cruel, without a fixed habitation, without government, without society, without any sort of common interest, and living only from day to day, every attempt to soften their savage habits has hitherto failed;^e the hatred of the neighbouring tribes also was very much excited against them long before the arrival of Europeans. These last, far from hunting them down, as some have supposed, welcome, on the contrary, such of the Saabs as roam in the neighbourhood of the colony, and make them presents of beasts, poultry, tobacco, brandy, coral, and buttons, to incline them to habits of peace. Very recently, the inhabitants of the northern districts united in distributing to one particular troop of Saabs thirty oxen and 1600 sheep, that they might have something for their subsistence; in a short time not a vestige of these remained, from the concourse of distant hordes that joined the party, and did not separate until the whole was consumed. It is a most civilized tribes of the Hottentots, and particularly the Caffres, who wage a deadly war against them,—even the sight of a Saab puts them in a rage.^f A Caffre, deputed by a small horde of his nation, being, in 1804, at the Cape, perceived in the government-house, among the other domestics, a Saab, about eleven years of age; suddenly he darted upon him with an intention to transfix him with his *hassagay*. The Saabs are the only people of Southern Africa who make use of poisoned arrows; it is with this weapon that they lie in wait for passengers in the *karroos*, by hiding them-

selves behind the ferruginous rocks, from which they are with difficulty distinguished. Often, after having received the sort of tribute which the colonists are forced to pay them, they come during the night to their habitations, plunder them of their cattle, and then fly with the greatest rapidity to their inaccessible mountains. If overtaken in their flight, they do not abandon their booty without either killing or maiming the plundered cattle; they sometimes even massacre every thing they find in the fold—horses, oxen, sheep, dogs, and shepherd, without deriving the least advantage from it.^g Like the *hyæna*, the sight of blood, and the smell of dead bodies, is said to afford them pleasurable sensations. Still the poor Bushman is capable of being reclaimed from the degraded condition we have attempted to delineate, after the testimony of travellers. Far in the interior, they are found to inhabit small villages, and to have made some progress in the arts of life. M. Smit, a boor at whose house Campbell halted, had fifty of them, of all conditions, employed on his farm. "They appeared to be all in good spirits, free from care, and depending entirely on Mynheer for their support. M. Smit had always found, if he committed any thing to their care, that they were faithful to their trust; but whatever was locked up, and not committed to their charge, they would steal if they could." Hence, though M. Smit did not require so many assistants, he judged it better to retain them in his service, than to be surrounded with such a number of thieves, and to be obliged to shoot them as others had done.^h When taken young, and well treated, they become excellent servants, and shew great activity, talents, and fidelity.ⁱ

Savage tribes are continually changing their idioms; every new chief wishes to introduce some new forms of speech: hence arises an instability and multiplicity of dialects, which perplexes critical study. This is a general phenomenon both in Africa and America; it is particularly the case in the instance of the different Hottentot idioms; they are continually varying. The words quoted by the earlier travellers no longer strike the ear of the modern observer; and each tribe, perhaps even each family, introduces terms which end in forming a jargon unintelligible to their neighbours.

According to M. Lichtenstein, the language of the Hottentots is in general remarkable for numerous rapid harsh shrill sounds, emitted from the bottom of the chest with strong aspirations, and modified in the mouth by a singular clacking of the tongue. The diphthongs *eou*, *ao*, and *ouou*^k predominate, and the phrase frequently ends with the final *ing*, pronounced in a musical tone of voice. In this clacking of the tongue there appear to be three progressive sounds, produced by the manner in which the back of the tongue is withdrawn from the upper part of the palate, or the point of the tongue either from the incisor teeth or the upper grinders. The peculiar construction of the organs in this race facilitates much the formation of these sounds, which in others would be very difficult. The bony part of their palate is in general narrower, shorter, and proportionally less arched in the back part than that of Europeans and Asiatics.

^k French pronunciation.

The language of all the Hottentot tribes, including that of the Bushmen, is the same; it is a fact at present established, by the singularities which they have in common, and by the resemblance of many of the words. It must, however, be confessed, that the idiom of the Bushmen offers more striking differences than is observed between the different dialects of the Hottentots, and even sufficiently strong to prevent the two races of people from communicating with each other except by signs. Besides, the clacking sound of the Bushman idiom is stronger and more frequent, the nasal sounds clearer, and the ends of the sentences a great deal more drawing.

The *Colony of the Cape*, spread over an extent of 120,000 square miles, nearly equal to that of Great Britain, contained, by the census in 1821, a population of 114,903; but as it does not comprise sojourners, nor troops in garrison, crews of ships, nor unsettled inhabitants, or Hottentots, which are estimated at 5000 more, the whole population may be safely affirmed to exceed 120,000 in 1822.^a Since 1798, the progress of the census has been as follows:—

1798.	1806.	1810.	1814.	1819.	1821.	1821. Corrected.	1822. Corrected.
61,947	75,145	81,122	84,069	99,026	113,903	116,044	120,000

Or, the population of the Cape has been increased by one half in sixteen, and doubled in twenty-four years. Of these 47,978 are free; namely 24,977 males, and 23,001 females; 14,291 male, and 14,544 female Hottentots; 918 male, and 451 female prize slaves, formerly released from illegal slave traders, and now indentured as apprentices for fourteen years; lastly, 19,164 male, and 13,024 female slaves. According to estimates on the spot, the Hottentots double their number in twenty-five years, the slaves in thirty-three years; and it is observed that, owing to emigration, the population of the eastern division of the colony increases much faster than the west, though even this nearly doubles its population in twenty-four years. There is now, therefore, an individual to every square mile, or forty persons to every farm, the total amount of those in the colony being about 3000, though very unequal in point of extent. The white people are descendants of English, Germans, French, but chiefly of Dutch. The district of *Tulbagh* lies farthest towards the north, and is least known. The second, which includes the whole eastern part of the colony, derives its name from the pretty village of *Stellenbosch*. The most southern part, washed by the sea, is called *Hottentot Holland*; it is a country as fine as it is fertile in corn and wine. The most remote eastern district is called *Graaf Reynet*. It is here that the inhabitants, all either shepherds or hunters, live in a state quite patriarchal; the men are gigantic; the women have a peculiarly fresh complexion and majestic figure. *Algoa bay*^b has a small fortification. The district of *Zwellendam* ranges along the southern coast, and includes the cantons of *Sitsikamma* and *Houtiniqua*, with the bays of *Plettenberg* and *Mossel*.^c

Throughout the whole colony the farms are generally detached and isolated. The farmers, called in Dutch, *boers*, or peasants, carry the superfluous produce of their harvests to Cape Town, on heavy carriages, drawn by a great number of oxen. Their hospitality to travellers, the

necessary result of want of inns, is sometimes interested, and yielded often with a bad grace. Since the period of the residence of the English, their manners have become more polished. The colonists have been too much calumniated by certain travellers, who accuse them of inhumanity towards their slaves; in fact, the account we have just given of that part of the population doubling itself in thirty years, is a sufficient answer to this antiquated reproach. Though the Cape Dutch are proverbially fond of gain, the number of emancipated slaves is always considerable; in the course of the year 1820, it amounted to six male, and twenty-six female slaves; probably more than in all the slave colonies of the world besides. It must be owned, however, that before the suppression of the slave trade, the waste of life in this unfortunate class was much greater than now. It was rated by Barrow at 3 per cent. it is now less than 2 in males, in females scarcely $1\frac{1}{2}$; while births are 4 per cent.

The people of colour are estimated at a tenth part of the free population. The remaining black population are Malays, negro slaves, indentured negroes, Hottentot and Bushmen servants, and free Hottentots. The negroes were brought from Madagascar and Mozambique, and are chiefly labourers; the Malays are artizans, their females house servants; and are as remarkable at the Cape as in the east for a sinister and dangerous activity of character. The number of them who have by their economy purchased their freedom is very considerable. The last and most valuable class of slaves is the *Africander*—the African born slave, the produce of an European or Cape Dutchman, and of a slave girl. They are not much darker than Europeans, and are the confidential servants of their masters, highly esteemed.

Cape Town, the capital of the colony, reaches from the level of the sea to the foot of the Table and Lion mountains, along the shores of Table Bay; this bay is deep, but the sea is often rough, and the anchorage unsafe. Vessels enter it only from the month of September to the middle of April; during the rest of the year they put into False Bay, where they are sheltered from the north-west winds. This, which is also called *Simon's Bay*, becomes in its turn unsafe during the opposite season, when the winds blow from the south-east; so that the Cape, situated between two bays and two oceans, has not a real port. All the streets are built at right angles; and, in only one of them, a canal brings Holland to our recollection. The houses, built either with stone or brick, are adorned with statues; they are generally flat-roofed.^d The public buildings have little beauty: the Calvinistic church, in its interior, has many armorial bearings, epitaphs, and escutcheons, in relief and in painting, of former dignitaries of the Dutch church and state, but the last member of Dutch titled nobility is lately dead.^e The Lutheran chapel is also admired for its elegance; and, during the government of Lord Somerset, the English built an elegant commercial hall, of ample dimensions. Other public buildings are the castle, the great barracks, the granary, the custom-house, the club-room or society house, and the colonial office building. The latter contains the library lately erected by the government, or rather engrafted upon the Dessinian libra-

ry, heretofore under the management of the ministry of the Calvinist church. The founder was a German emigrant, a man of some learning and great benevolence: when alive, he was secretary to the Orphan institution, and by the manumission of all his slaves, embalmed his memory at his death. The library is now a noble collection, contained in two spacious halls, besides other apartments, and apparatus for chemical experiments. The only thing wanting is readers; reading is not an African passion; and a few years ago, some Frenchmen, who, with M. Collin, wished to see it, were obliged to give several days notice to the keeper of this neglected depot.

Cape Town, founded in 1652 by Van Riebeck, was peopled by bad characters exiled from Holland, by soldiers who had obtained their discharges, and by sailors who, having saved some property at Batavia, were enabled to disengage themselves from the service. At the time of the revocation of the edict of Nantz, many unfortunate Frenchmen, whom a barbarous mother rejected from her bosom, were hospitably received in Holland. Many of these Frenchmen established themselves at the Cape; they even peopled a small canton called by them the *Coin Français*,^a which is still inhabited by their descendants; they have only preserved French names much disfigured. The language is almost forgotten, and their customs are those of the Dutch. Cape Town possessed in 1821, a population of 9761 free inhabitants, 9661 Hottentots, apprentices, and slaves, in all 19,422; in 1798, the census only amounted to 5500, in other words, the population of the town increased nearly twice as fast as that of the colony. The number of houses is 1478, so there are more than thirteen to a family. Education is much neglected by the Dutch at the Cape; the young speak French and English tolerably well. There is indeed one colonial establishment for classical and school education; but the master is the colonial chaplain, with a salary of 1600 rix-dollars per annum besides his cure. In other respects little informed, they all excel in the arts of exercise; although good horsemen, and dextrous hunters, three fourths of their life are passed in smoking; they even go to sleep with the pipe in their mouths, and are continually drinking tea, coffee, and gin. "The women, until the age of twenty or twenty-five, continue very handsome: their blue eyes, hair of a clear chestnut colour, a rosy complexion, and extreme neatness, lead one to overlook their manners, which are far from elegant; after this age they generally lose the lightness of their figure, become very fat, and more worthy of their husbands, whose phlegm, mean appearance, and awkward gait, little corresponded before with their delicacy. Women are found at the Cape of great simplicity of exterior, who are at the same time very amiable and well informed." These are the words of M. Collin, a Frenchman. The English author of the "State of the Cape," 1822,^b says, "Very frequent marriages take place between English gentlemen and Cape ladies; but the pleasing and engaging manners of the Cape Dutch girls, and their vivacity, less forward than that of the French, but enough so to subdue English coldness, is quite at variance with the obtrusive presumption of the younger part of the other sex, and in them it is not to be denied, that abundant materials exist, which, when properly worked, form a totally different

man. Ignorant of the gradations of society, and with all the chances against him, from the natural good feelings of the mind, the individual generally turns out a respectable character as he advances into life." Mr. Barrow, no friend to the Dutch of the Cape, bears a similar testimony to the engaging sweetness of these ladies.

The established religion of the Cape is Calvinistic; the people devout and attentive to its duties.^c The young are catechised weekly, and pay the strictest attention to their teachers. Besides a Calvinistic church in each of the twelve districts, at 2000 rix-dollars, or 150*l.* per annum, with house and farm from the colonial government, two missionaries for Chinnie^d and Caffraria, at 75*l.* per annum, with free farm, there are two English chaplains, receiving 700*l.* and 350*l.* sterling, and a Lutheran clergyman, at 13*l.* a year, from the revenue of the colony. The English, who receive between them nearly as much salary as all the rest, are the only clergy complained of for neglect of duty. A Roman Catholic chapel is now building by subscription. There are sixteen missionaries of the London society, six Wesleyan, and three Moravian missionaries. The latter, by making industry and religion twin sisters, have not only made great progress themselves, but suggested improvements to those of other sects.^e The Malays, amounting to 3000, carry on their devotion in rooms, or halls, occasionally in the town quarries, under a learned *imam*, who chants the Koran with great taste. Mahometanism makes amazing progress among the lower orders at the Cape. Slave owners are impressed with an erroneous notion that a slave once baptized becomes free, and are, therefore, adverse to the Christian instruction or baptism of their slaves. Hence the slave is forced to become mussulman, because he cannot become a Christian. The above prejudice, however, is daily wearing away, and there are now a few free schools at the Cape, where slaves are taught to read and write on the plan of Dr. Bell; the total number of scholars being from three to four hundred. The presence of the English at the Cape has produced a great change in its manners. Definitively placed under the English government, it must, by degrees, lose the character of a Dutch colony.

This colony is susceptible of great improvement. Situated in the route from Europe to India, vessels that traverse these seas stop here for refreshment, and with a view of imparting fresh vigour to their crews, weakened by a long voyage. Its fertile soil producing every thing that is necessary for the wants of civilized man, may, strictly speaking, completely supply herself. Under an enlightened government, population will increase, commerce will find an easy market for its indigenous products, the culture of which will be improved by their interests being now better understood. It requires only an active superintendence to unite the Cape with the central parts of Africa, by well directed expeditions of discovery, and thus to draw from it unknown riches. During a period of war, the Cape is the centre of a maritime station, which commands the navigation of the East Indies. It is a central emporium to the trade of the eastern and western world; their relations to it, expressed in tonnage, are as 10,326 to 10,673 respectively. The Cape is rapidly growing into consequence, though its emigrants complain. Still there are circum-

stances which seem to set natural limits to its prosperity; the chief of which are the unequal distribution of water and rain, and the inadequacy of the soil to produce a quantity of wheat sufficient to supply the increase of inhabitants. The latter, however, is no weighty obstacle, since the supply of barley is abundant. Maize also may be well suited to the climate.

Next to agriculture and wines, which are still the staple commodity at the Cape, the whale and seal fishery must be ranked. Immense numbers of the finest fish swarm in the vicinity of the Cape, and considerable quantities are taken by whale boats, affording exports to the amount of 24,760 rix-dollars. Aloes, hides, barilla, ivory, ostrich feathers, fruits dried in the sun for the Indian market, and horses, are the other products for exportation. The breed of the latter has become extremely valuable since the arrival of the English, and the consequent encouragement given to horse-racing. About 200 horses, value 56,980 rix-dollars, were in 1821 exported to India. The whole amount of exportations exceeds two millions of rix-dollars. The internal commerce of the Cape is chiefly maintained by hawkers, by a few shops in the small towns, and most of all by the visits of the boors to Cape Town, often after a journey of 500 miles, over deserts which detain them several weeks, and by the fairs which are established at different points of the colony. In the months from September to February, when wine and corn is brought in, a line of wagons, each drawn by six, ten, or twelve oxen, will make its appearance from the country at day-break, extending some miles. After an abundant harvest, 180 have been counted in one morning—the average of the month of January, 1822, was sixty daily. The boor travels in a horse wagon, in which he overtakes one or two ox wagons, sent forward on the road. His wife and children accompany him, and after laying in a stock of necessaries sufficient for himself, family, and slaves, until next yearly or half yearly visit, he returns in a few days to the interior. The eastern parts of the colony are supplied by coasting vessels. The tonnage employed in this trade, in 1821, amounted to 1962 tons, in the coasting trade in general to 4507 tons, and the whole amount of tonnage in Table Bay, exclusive of men of war, 56,447 tons. For the defence of this great resort of shipping, from the S.E. monsoons, it is in contemplation to carry a mole on the S.E. of the bay to the extent of 2000 yards. Under commercial advantages of the Cape, ought to be enumerated the annual disbursements of the Indian invalids at the Cape, which are ascertained to amount to 700,000 rix-dollars per annum. The executive authority is vested in the governor of the colony, and from him, or from British acts of Parliament, or orders in council, emanate all the changes which take place in the state. There is no legislative assembly here, as in the West Indies. The law, however, is well administered, with open doors, and is founded on the "statutes of India," proclaimed here by the Dutch of 1715; where deficient, the civil and Dutch law are successively resorted to. The court consists of one Chief Justice, and eight ordinary Justices, and these decide causes by a majority, the Chief Justice having a casting voice. There are no juries here. An appeal can be made from these nine judges to the Court of Appeal, consisting of the governor and an assessor, who is a barrister, in criminal cases, but in civil cases the secretary of the court. Unfortunately the judges

are not for life, but removeable at pleasure. It is evident, that great courage in the lawyers, and integrity in the governor, can alone preserve so improper a collusion of interests in a state of purity. Though the people are abundantly litigious, crime is not frequent, the heterogeneous elements of Cape population being considered. In 1821, the number committed was ninety-one, of whom eight were females; and of these, six were sentenced to transportation for theft, and eight condemned to death. The total number of capital condemnations for 1820 and 1821, all of which were for murder, amounted to seventeen; namely, nine Hottentots, one Bushman, one prize negro, one European, and five slaves. Three of these were remitted; the European suffered. On the fourth of March, 1822, there was only one person confined for debt; eleven appears to be the maximum. Justice is administered to the seven country districts by the *Landdrost*, who is a kind of sheriff of the district, assisted by six *Heemraden*, as assessors. The *heemraden* are selected from the wealthiest and most respectable of the burghers, and seem to be the only popular part of the political machine. In every other respect the government of the colony is absolute, even to the censorship of the press and public journals. It is peculiar to the law of the Cape, to allow of matrimonial separation on the sole ground of mutual dislike; and to take on itself in a most beneficial manner the protection of orphans. An *Orphan Chamber* is established, which takes charge of the estates of all those who die intestate, or leave children minors; the chamber realises the estate; puts out the amount to interest on land, at the colonial rate of six per cent., payable every six months, making an allowance to heirs suitable to their condition and education till they come of age. Every method is taken for the discovery of heirs. This excellent institution is the result of a beautiful trait in the character of the Cape Dutch. "No surer proof of their kind disposition can be offered, than the frequent adoption of children of persons not related to them, whose parents may be dead or may have met with misfortune. They find protectors and friends, and by custom a godfather or godmother think it their bounden duty to provide for the children of their dead or unfortunate friends."^a A married couple saying in a shop they knew not what to do with their new-born infant, the master submissively asked to be allowed to take the child; and sending attendants with a sedan chair to receive it, was mortally offended when it returned empty, from the parents refusing to confirm the gift. There can therefore be no difficulty, except the present enormous exchange (of 195,) in the goods of those dying intestate at the Cape being transmitted to their European heirs.

The above singular depreciation of the paper money of the Cape, has arisen chiefly from an over issue of that article, without any guarantee for its value. The rix-dollar should be worth nearly four shillings, at present it scarcely equals one shilling and sixpence. Gold and silver have consequently long disappeared; and the only metallic currency of the Cape consists of English penny pieces. The distress and annoyance proceeding from this circumstance is incalculable, and can only be remedied, it is stated, by an issue of money representing actual value. At present, three millions of paper dollars circulate without this guarantee, although the whole produce does not exceed nine millions; while it is known that one-tenth^b of the amount of the an-

^a State of the Cape, p. 168.

^b Wealth of Nations, II. 32

nual produce is generally sufficient for the medium of its circulation in any country. The evil cannot but be aggravated in a country whose imports are three times as large as the exports, the former being six millions, the latter two millions of rix-dollars, in 1821.

This cause, so common in all new countries, and so little attended to by their governments; the occurrence of three successive seasons of drought; the arrival of shoals of emigrants, apparently removed from Britain without any proper measures being previously taken for their establishment, or without a single functionary in the colony having

been consulted,^a have thrown a gloom for the present over the otherwise flourishing colony of Southern Africa. Yet as vicissitude is the great law of nature in her operations, an early recurrence of droughts, these terrible precursors of famine, cannot reasonably be dreaded; and when we compare the other two evils with the mighty powers of compensation possessed by the mother country, the Cape may soon be expected to raise its head, the finest, and not the least flourishing or important settlement of the British empire.

BOOK LXXI.

AFRICA.

Continuation of the Description of Africa.—South-East Coast, or Caffraria, Monomotapa, and Mozambique.

THE most recent observations have shown that the people scattered along the south-eastern coast of Africa, from Algoa Bay as far as Quiloo, and perhaps farther, resemble each other in certain physical characters, that distinguish them from the negro race. The skull of these people, like that of Europeans, presents a raised arch; the nose, far from being flat, approaches the hooked form; they have, however, the negro's thick lips, and the prominent cheek-bones of the Hottentot; their frizzled hair is less woolly than that of the negro; their beard stronger than the Hottentot's; a brown or iron-gray complexion also appears to separate them from the negro.^a The idioms of these people, although little known, have points of resemblance. The slaves of Mozambique understand many words of the Betjouana language. The inhabitants of the environs of Quiloo designate the divinity by the same name as the Betjouanas. In all these dialects, words may be discovered borrowed from the Arabic. The custom of circumcision is equally prevalent among all these nations, who appear to have received their civilization from Abyssinia and Arabia.

By what name is this race to be designated? Chance has rendered common to a considerable number of these people an arbitrary name. The Portuguese navigators, after doubling the Cape of Good Hope, found the inhabitants of the eastern coast of Africa more advanced in civilization as they approached the north, where the Arabs had introduced their own manners and religious belief. These Mahometans designated under the vague name of *Caffres* or *heretics*, all the natives of those countries into which the Mussulman religion had not been introduced. Under the name of *Cafarah*, or *Caffraria*, the Arabian geographers comprehended the whole interior of Africa. Caffraria might thus reach to Nigritia,^b border the Indian ocean from Zeila as far as Brava,^c and again extend to the shores of the sea to the south of Sofala.^d In proportion as the specific names of kingdoms and people became known to Europeans, the extent of Caffraria diminished on the maps, and had finally become extinct. Nevertheless, when the Dutch at the Cape, while extending by degrees the limits of their colony towards the east, found it necessary to make known their neighbours, then almost forgotten, they adopted the Arabic name, transmitted by the Portuguese writers, with a view of applying it particularly

to the tribe with whom they were in immediate contact, the true name of which is *Koussa*.

We conceive that the term *Caffre* may be provisionally employed for designating the predominant, and probably the indigenous race of eastern Africa, while, at the same time, it would be inconvenient to apply it to any tribe in particular.

The Caffre nations inhabit a region less known than almost any on the globe. We there see, behind a marshy, unhealthy, but fertile coast, chains of mountains arise that have been very imperfectly examined, which appear to be in a parallel direction with the coast, that is, from south-west to north-east. Do these interrupted chains, traversed by several rivers, proceed from a *plateau*, or from a central chain? Do the rivers *Zambese*, *Coavo*, and *Quilimancy*, derive their sources from amongst rocks, precipices, perhaps even from the midst of snows and ice, or are they formed in vast sandy plains, like those of the plateau of central Asia, or in verdant savannas, similar to those of America? There is nothing to assist us in resolving these questions. The burning winds that proceed from the interior seem to argue against the existence of this central chain, which, under the apocryphal name of *Lupata*, or *Spine of the world*, is traced at random on our charts. The Portuguese historians speak of it only as of a thick forest, interspersed with great rocks.^e The great lakes, of the existence of which little is distinctly known, may, with as much probability, have formed their basins in plains of sand as among rocks and glaciers. The Portuguese merchants in traversing Mocaranga, to the west of the state of Monomotapa, have only observed small hills covered with copses of thorny shrubs.^f The interior of Ajan, to judge by its productions and animals, ought to be a dry plateau. Finally, the mountains of Abyssinia do not present any fixed direction, and consequently do not indicate a great chain well marked.

In this absence of all positive information, let us abstain from those vain and presumptuous general opinions, by which certain geographers attempt to give proof of their genius; let us only simply describe the different countries in rotation.

The coast of *Natal*, extending from the Great Fish River, the boundary of the colony of the Cape,^g as far as the bay of Lourenço-Marquez or Lagoa, is watered by many rivers, sprinkled with wood, and intersected by magnificent savannas;^h there is no port safe, and deep enough to af-

ford shelter to large ships. None of these rivers have a long course. In the interior are chains of mountains that appear to be of a calcareous nature as the natives hollow caverns in them,^a in which they live with their herds. The *holcus*, maize, and cattle, constitute the wealth of the inhabitants. They obtain a species of silk from a plant like the *Asclepias Syriaca*. Jacob Franck, the traveller, in the neighbourhood of the bay of Lagoa, saw lemon and cotton trees, sugar canes, and a seed called *pombe*, which is used to make an inebriating drink.^b The animals, probably more numerous than the men, roam in large troops; the most remarkable are elephants, antelopes, the rhinoceros, and hippopotamus.^c

It has recently been asserted that the unicorn, or *monoceros*, of the ancients, has been found here; which, if proved, would make this region very interesting. A respectable author, of the sixteenth century, has stated that the first Portuguese navigators saw, between the Cape of Good Hope and Cape Corrientes, an animal having the head and mane of a horse, with one moveable horn.^d It is precisely in this same region that two good modern observers have seen several drawings of a one-horned animal; all the rocks of Camdebo and Bambo are covered with them;^e the Dutch colonists affirm that they have seen these animals alive, and had killed some of them; they resembled the quagga, or wild horse; the horn adhered only to the skin.^f These positive testimonies, unfortunately of illiterate witnesses, are nevertheless corroborated by the account of Barthema, (or Varteman,) who, in the fifteenth century, saw at Mecca, two unicorns like antelopes; they had been brought from Ethiopia.^g The ancients have undoubtedly given a fabulous and vague account of this *monoceros*; they nevertheless unanimously compare it to a horse in the form of its body, with the head of a stag;^h which proves their having had in view an animal differing much from the rhinoceros. Besides this unicorn resembling a horse, the ancients distinctly name the *unicorn ass*, of a great size, with a horn striped with white, black, and brown, of great swiftness, and fond of a solitary life;ⁱ they describe it as *soliped*, like the unicorn horse, a circumstance that refutes the systematic objection of anatomists, drawn from the analogy of animals with divided hoofs which all have two horns. Besides this objection of our infallible philosophers is not altogether a solid one, as there are antelopes in which the two horns arise from a common base, raised two inches above the head;^j how then can nature be prevented extending this union from the base to the point? Besides, the accounts of those among the moderns who pretend to have seen the unicorn, remove this difficulty, by representing the horn as attached only to the skin, similar to that of the rhinoceros.

The existence then of the unicorn is not impossible, as has been said, but neither is it proved, nor even likely; this genus, like many others, may have become extinct;

whether, however, this animal exists or not, its representation upon the rocks of Southern Africa is not less a curious circumstance; it concurs in proving the ancient connexion of Caffraria with Asia: for the figure of the unicorn was, among the Persians and Hebrews, the symbol of kingly power; it is with this meaning delineated on the monuments of Persepolis. At Mashow, a town in the territory of the Tamahas, an animal of the rhinoceros kind was killed in 1821,^k having a horn projecting three feet from the forehead, arising about ten inches above the tip of the nose. A few inches of a small second horn, behind, did not effect its unicorn appearance. The head measured three feet from the mouth to the ear. It is at present deposited in the British Museum. The origin, figure, position, and magnitude, of the horn, correspond exactly with the above-mentioned representation of the unicorn in the Bushman caves of Bambo, as delineated by Barrow,^l and not the smallest doubt can remain that Mr. Campbell's animal is identical with the Bushman original, as far down as the neck. The country in which it was killed, lies directly north from that assigned to the unicorn by Barrow, namely, behind the Bamba mountains, where the animal found by Campbell is so far from being rare, "that the natives hardly took the smallest notice of the head, but treated it as a thing familiar to them." They make from one horn, four handles for their battle axes. Another creature of the same kind was seen and wounded at the same time. The unicorn then, or a quadruped with one long projecting horn, is found, but it would be endless to attempt to reconcile the jarring accounts of remote antiquity, and modern ignorance, with the present interesting discovery.

The tribe that first presents itself, in tracing the coast from south to north, is that of the *Koussas*.^m We have been made acquainted with it by two recent travellers, Lichtenstein and Alberti.ⁿ The country of the *Koussas* is bounded on the east by the Key River, on the west by the Great Fish River, on the south by the Sea, and on the north by a great chain of mountains, running from west to east, and dividing it from the territory of the Bushmen. It is traversed by the Keyskamma and Buffalo Rivers: the last alone furnishes good water. It is not now the Great Fish, but the Keyskamma River which is considered to form their western boundary.^o The territory between the Great Fish and the Keyskamma, including a parallelogram of 2000 square miles^p of the finest land in Caffraria, fertile, well watered, abounding in luxurious pastures, has lately been ceded by the friendly chief of the Caffres, Gaika, for the purpose of constituting it a *neutral ground* between the British colony and Caffraria. But the real object to which it has been applied, is the accommodation of the emigrants who sailed from England in 1820. It forms a new district under the name of Albany.^q

The soil is a black earth, rich, and extremely fertile.^r The banks of the rivers and the low hills are covered

^a Natural caverns are common in some limestone rocks; but any soft rock, such as sandstone, might be excavated by man.—P.

with mimosas, aloes, euphorbias, and other high trees, or with thick bushes almost impenetrable. Among the vegetables is a species of reed well suited to quench thirst, although growing in brackish water. The downs,^a at the mouth of the Key, produce wild pisang in great abundance. It is not rare to find honey among the clefts of the mountains, in the hollows of trees, and in deserted ant holes. Between the Fish and the Keyskamma Rivers, there is excellent pasturage, both for large and small cattle. The grass that grows to the east of the Keyskamma contains too much acid, and hardens in ripening; many species of antelope feed on the western banks, also an incredible number of chamois, numerous herds of roe-bucks, elks, and other species of antelopes, wild horses, wild boars, ostriches, peacocks, pintados, geese, and other aquatic birds. These peaceable animals are pursued by lions, panthers, wolves, jackals, and many birds of prey. On the eastern bank, on the contrary, as far as the river Lagoa, only a few elks and horses are to be seen; but the elephant and hippopotamus appear to inhabit this part in preference.

The winter is not generally so rainy as at the Cape; Fahrenheit's thermometer seldom rises higher than 70 degrees, and seldom falls below 50; during the rest of the year it varies from 70 to 90 degrees; nevertheless, in the height of summer, storms are sometimes preceded by blasts of burning winds, which cause the thermometer to rise suddenly to 100 and more degrees.

The Koussas are generally tall, with a handsome head, regular features, an easy light figure, sinewy arms, all the limbs perfectly developed, noble carriage, vigorous attitude, and a firm resolute step. The colour of their skin is a blackish gray, or like iron recently forged, which is only unpleasant at first sight. But, with a view of heightening the effects of nature, they not only paint the face but the whole body, by rubbing themselves with a red pigment diluted with water, to which the women often add the juice of some odoriferous plant. The better to fix this application, they cover it with a layer of grease or marrow, as soon as it is dry, which attaches it more closely to the skin, and renders the latter more pliant. Red, in general, is the favourite colour of the Caffres. Their hair is black, short, woolly, hard to the touch, and united in scattered tufts. It is uncommon to see one of these Caffres with a full beard; the chin alone is generally covered with a few tufts of down; it is the same with the other parts of the body.

The women are much smaller, and rarely attain the height of a well-made European female; but with this difference, they are as well formed as the men. All the limbs of a young Caffre woman have the rounded and elegant form so much admired in antiques. Their breasts are well formed; contentment and cheerfulness are depicted in their countenances. The two sexes have a smooth and perfectly healthy skin. The same phenomenon discovered among the Hottentots, and which has given rise to so many absurd accounts, exists among the women of Caffraria; only the prolongation of the membrane is much smaller. Owing to their simple and natural mode of life, the Caffres are neither ugly nor deformed. Numerous herds of cows furnish an abundance of milk, which is their principal food. They always eat it in the state of curd, and keep it in rush baskets of admirable workmanship.

Their other aliments are meat, generally roasted, millet, maize, and water-melons, which they prepare in various ways. They have no salt, nor do they substitute any other seasoning. Water is their only drink. It is only now and then that they make an intoxicating drink with the meal of millet fermented. They cannot be persuaded to eat the flesh of tame hogs, hares, geese, or ducks, nor any kind of fish. When asked the cause of their dislike, they answer, that hogs are fed with every sort of filth; that after having eaten hare they become mad; that geese and ducks have a disagreeable voice, and resemble toads; and, in short, that all fish belong to the race of serpents. They are all passionately fond of tobacco. The *Hamboonus*, on the contrary, near Rio de Lagoa, never smoke; but, in return, they take a great deal of snuff.^b

The Koussas are very active. It is not uncommon, for example, that a party will continue to pursue an elephant several days-together, even at the hazard of their lives; yet they do not eat the flesh, and the teeth, which are the most precious of the spoil, are the property of the chief of the horde, and are therefore presented to him. They have a particular taste for long journeys, which they often undertake for the sole purpose of seeing their friends, or even merely for the sake of the journey, and of having something to do. After a journey of thirty or forty leagues, performed in the shortest possible time, they do not shew any appearance of extraordinary lassitude, and a small present is sufficient to induce them to dance after this fatigue.

Their clothes are made of the skins of sheep, which they prepare with much art; they hang down to the calf of the leg. Ivory rings, worn on the left arm, are their principal ornaments. All the women have their back, arms, and the middle of the breast, furrowed with parallel lines, at equal distances. These incisions, which, in their opinion, add beauty to their persons, are made by introducing a bodkin, like a bistoury, under the skin, which is torn as they turn up the point. They are very orderly in their families. Plurality of wives is permitted; those only, however, who are in easy circumstances, have two, and seldom more. The women, in general, are very fruitful; yet more children are found among those who do not share their husband's company with another, nor does polygamy favour population so much as is generally supposed. The dwelling of each family consists of a circular cabin very low; its construction is the work of the mother and daughters. Cattle are of the first importance to the Caffre; they may be said to constitute the chief object of his thoughts and affections. The Caffres are the true Arcadians of Theocritus. Sometimes the peculiar lowing of a cow is so delightful to the ear of a Caffre, that he cannot rest until he has purchased it, and to have it he pays often a great deal more than the real value. The best trained dog does not more rigidly obey his master, than these horned cattle the voice of their conductor. A sudden whistle will stop a large drove of oxen; another whistle will be sufficient to put them again in motion. Cultivation of the land also provides the Caffres with a part of their subsistence; the women perform the labour.

At the age of twelve years, the children of both sexes receive a sort of education from the chief of the herd. They are divided into companies that are educated according to the exigency of the service. The boys are appointed to

^a "Dunes," sand hills

^b Alberti, p. 12.

the care of the cattle ; at the same time the public officers exercise them in the use of the javelin and club. The girls are taught, under the inspection of the chief's wives, to make clothes, prepare food, and, in a word, to perform the work of the hut and garden.

Circumcision is in general use among the Caffres : it is performed when the young man approaches the age of puberty, nor is there any religious idea attached to it.^a

The children are very dutiful to their parents, and during their whole lives treat them with great respect. Women do not regularly take any part in the deliberations which have for their object the general interests of the horde ; but, in time of war, when the lives of ambassadors might be in danger, women are deputed to carry the proposals of peace to the enemy, it being perfectly certain that no ill will befall them.

A universal sentiment of kindness unites all Caffres, and every individual considers an injury done to another as if it were his own ; they interfere in the affair with the greatest earnestness. Although very self-interested, they exhibit the most perfect good faith in their commercial dealings. Hospitality is in their eyes a sacred duty, which they discharge with the most earnest alacrity ; every stranger is received and welcomed ; they even go so far as to provide him with a companion for the night.

Far from being a warlike nation, the Koussas have a decided preference for peaceful habits and a pastoral life ; they do not, however, hesitate to have recourse to arms, whenever they are called upon to defend or assert their rights, whether real or imaginary. Their arms consist of the hassagay, the shield, and the club, which they handle with great dexterity ; but they are very bad marksmen. A late traveller^b cites an example. After having distributed brandy to a body of Caffres, a board was erected at the distance of sixty paces, and a red cotton handkerchief offered as a reward to any one who should first hit the mark. They laboured a very long time before any of them got the prize. But the iron point of the hassagay pierced the board through and through, although an inch in thickness. This shews how dangerous a weapon it is in the hands of a resolute man. The Caffre holds in his left hand a bundle of hassagays, which he darts one after the other from his right, at the same time running upon his adversary ; he grasps the last in his hand, in order to strike in close combat. " Having finished this first exercise," continues M. Lichtenstein, " they gave us, of their own accord, a representation of their manner of fighting. They placed themselves in line, and imitated with violent and animated efforts, the action of throwing the javelin, and, at the same time, avoiding the enemies aims. For this purpose, they continually change their position, jumping from right to left with loud cries, throwing themselves for an instant on the ground, and rising suddenly with great vigour to take a new aim. The agility and swiftness of their movements, the variety and rapid succession of the finest attitudes, the graceful, noble figure of the naked combatants, rendered the sight both new and interesting." Previous to the commencement of hostilities, the aggressor sends to his adversary heralds of arms, carrying before them a lion's tail ; that emblem indicating their office, and the nature of the message of which they are the bearers. As soon as the army of the

one who has declared war comes near the enemy's camp halts, and heralds are again sent to announce its approach. If the latter has not yet assembled all his forces, he informs his adversary, who is obliged to wait until he has collected his people, and is ready to fight. The Bushmen, who are their neighbours towards the north-west, are the only people with whom they wage perpetual war ; they treat these brigands like wild beasts, follow them by the track to discover their haunts, and massacre without mercy those who fall into their hands, making no distinction of age or sex.

They are very fond of the chase, to which they set out in numerous parties ; the married and unmarried women often attend these expeditions, which last even two or three months. To subdue a lion, they begin by forming a circle round him, and by approaching him gradually towards the centre. The wounded animal immediately attacks one of the hunters, who avoids him by suddenly throwing himself on the ground covered by his shield, while the others run and pierce him with their hassagays. The conqueror re-enters his village in triumph. Hunting the elephant is most laborious. The Caffres are seldom able to inflict the wound sufficiently deep to render it mortal.

Their favourite diversion is a dance very regular, stiff, and ridiculous ;^c accompanied with a most disagreeable air. The only musical instrument seen among them consisted of a stick, upon which was extended a chord of catgut ; it is peculiar to the *Gonaqua* Hottentots, the ancient inhabitants of the southern promontory of Africa, who, since the enlargement of the European colony, have ceased to constitute a tribe, and are at present dispersed over Caffraria.^d

Each horde of Caffres has ordinarily its hereditary chief, called *inkoossie*. Whenever many hordes are assembled in the same district, they have at their head a supreme chief, esteemed the sovereign of the district. The chiefs exercise an absolute power ;^e but in cases of injustice or usurpation, the council remonstrates in the name of the people.

The right of the strongest does not exist among the Caffres ; no one is allowed to be his own judge, excepting where a man surprises his wife in the act of adultery. Unfortunately the example of European corruption already exerts its influence on the manners of this pastoral people. The arrogance of the colonists, frauds committed in commerce, and abuse of force, joined to the instigations of some bad characters of the colony and of revolted Hottentots, have brought on disastrous wars between the Koussas and the colonists, wars which have left behind them revengeful sentiments ; nothing, however, is more easy than treating with these people, by appealing to their natural equity. Mr. Barrow's former embassy to Gaika, who is still their chief, was not productive of any lasting effects. The colonists, with peace in their mouths, secretly excited the Caffre rebels to acts of aggression. A war broke out again in 1818, which terminated, as we have seen, (in 1821,) by the British depriving them of their best territory, now named Albany. A line of military is posted along the Keyskamma, and the Caffre sovereign has consented to receive missionaries into his territory, and to celebrate fairs on the boundaries, for the purpose of commercial inter-

^e A chief has no power over the lives or property of his subjects ; but is amenable for every offence to the established laws of his horde or nation.—*Ed. Encyc.—P.*

course, which had been interrupted by the war. Driven from their most fertile lands into a desert too barren for support, this interesting and once happy people seem destined to the extinction so lately suffered by their neighbours, the Gonaquas, or the still more degraded fate of the wretched Bushmen. Want infallibly produces despair; the frontier colonists, instead of being secured by this precipitate advance of their boundary, or by unheeded proclamations for the preservation of peace and amity with the Caffres, may possibly yet have cause to regret that cupidity which has added the impulse of hunger to the thirst of vengeance.

The arithmetic of the Koussas is confined to addition, which is performed by counting on the fingers; they are without signs for decimal notation. Their longest measure of time is the lunar month; an addition soon results that surpasses the bounds of their arithmetic; they are unable to determine any very considerable period of time, of the past as well as the future; they succeed better in marking with precision the hour of the day; this is effected by extending the arm towards the point where the sun at the time is seen on the horizon. To this ignorance of calculation, and total want of chronology thence resulting, must be attributed their deficient information respecting the origin and the history of their nation; every thing known by them on the subject may be reduced to this: "In the country where the sun rises was a cave whence the first Caffres issued, and in general all the nations as well as animals of the globe; at the same time both sun and moon appeared to give light to the earth, as well as trees, grass, and other vegetables, for the nourishment of men and cattle."

After passing the Key River, or its tributary streams the Zomo and Bassah, you enter the country of the Tambookas:^a the true name of which, according to a recent traveller, is *Ma-Thimba*. It is from these people that the Koussas derive their songs, composed less of words than of syllables unintelligible to themselves.^b They possess iron and copper mixed with silver; at least their rings are composed of a similar metal.^c On the other side of the Nabagana are the *Hamboonas*: their identity with the *Mambookas*,^d supported by Lichtenstein, is not altogether incontestible. The first name is that given by the Gonaquas to a tribe bordering on the Tambookas; the second is the name that the traveller Van-Reenen,^e heard given in the country, a name also known to Sparrmann. According to Lichtenstein, the Koussas call them *Immbo*. They cannot be distinguished among these obscure and uncertain denominations. Among the tribes remote from the coast are the *Abbatoana* and *Maduana*.

The coast of Natal is terminated by the bay of Lourenço-Marquez, to which a maritime lake, situated on its northern border, has caused to be given the Portuguese name of bay *da Lagoa*, that is, the Bay of the Lagoon. It has sometimes been confounded with the bay of Algoa, situated eight degrees farther south. The fertile shores of this beautiful and large bay have often tempted the ambition of Europeans; the establishment which could there be formed might export great quantities of ivory. The rivers Mafumo and Maquinis, or Saint-Esprit, which there empty themselves, are still traced according to an-

cient charts, and have not been explored by any known traveller.

In ascending the one or the other of these rivers, will be found the numerous tribes of the nation of the *Betjouanas*,^f that have been visited by travellers from the Cape. This nation is called *Briquas* by the Hottentots, from whom they are separated by the inhospitable desert of the Bushmen. Mr. Barrow, in writing this name *Bushwana*, has scarcely committed a serious error, because the difficulty of expressing the precise sounds of African idioms ought to make us even doubt the orthography given with the greatest appearance of accuracy. We are told that it also takes the name of *Moulitjouanas* and *Sijouanas*. In order to decide which of these names is the true patronymic of the nation, its etymology ought to be known.

The country of this people, situated between the twentieth and twenty-fifth degrees of latitude, has a very agreeable and varied aspect; forests of mimosas are intermixed with fine pasturage. The *Betjouanas* are divided into several tribes; on entering the country from the south, that of the *Matjapings*, on the River *Kurumana*, is first met with; it is one of the least powerful. One degree farther north, on the River *Setabi*, are found the *Murulongs*; their number amounts to ten thousand. Some years have now elapsed since these two tribes, then united at the source *Takoon*, constituted the renowned city of *Latakoo*, of which Barrow has left so brilliant a picture. Though shifted from its former site, it is still as large as the *new* city of the same name, fifty-six miles to the southward, at the source of the *Krooman River*.^g The *Matsarouquis*, to the west, on the lower confines of the *Kurumana*, border upon the *Dammara Hottentots*. To the north of the *Murulongs*, are the *Wanketzees*. The *Tammakas*, otherwise called *red Briquas*, a very numerous tribe, occupy several villages to the north-east of the *Matjapings*, to the south-east of the *Murulongs*, and to the north of the *Kharamankeys*, a tribe of *Corana Hottentots*, with whom they live in the most perfect harmony, frequently uniting in marriage, with a view of rendering their friendship more intimate. The *Khojas*, a tribe to the north-east of the preceding, are also very numerous, but little known. Three days journey to the north-east of the *Wanketzees*, and due north of the *Khojas*, are stationed the *Mukhuruzis*, under a chief renowned for his bravery. Lastly, to the north-east of these inhabit the *Maquinis*, the richest and most powerful of the *Betjouana* tribes. A *Matjaping* who had visited them, assured M. Lichtenstein, that they were numberless, like the sand. It is they who furnish to the others, knives, needles, ear-rings, and bracelets of iron and copper, which travellers have been so much astonished to find among these savages. They extract the metal from a chain of mountains lying between them and the *Mukhuruzis*. Campbell, in 1821, penetrated as far as *Kurechane*, the capital of the *Marootzees*, and was favourably received. They have made considerable progress in the arts, and understand the art of working iron and copper, with the first of which their country abounds. Their country lies on the twenty-fourth parallel of south latitude. Though not in immediate contact with the last Portuguese posts of *Monomotapa*, they occasionally travel down to these settlements; and it was by their accounts that the other *Betjou-*

anas became at all acquainted with the existence of white men, of which the greatest part of them doubted until they had seen the Dutch among them. The Mahalaseela, to the north-east, who use elephants as beasts of burden, sell beads, and live near the great water; the Matteeveylai to the east, who live near the great water, and have long hair; the Mollaquams, who live to the north-east, and bring beads to the Bouquains; the Malchaquams, eight days' journey to the east; lastly, the Bouquains and Wanketzees, are the immediate neighbours of the Marootzees. Beads with them are the great medium of circulation. The art of inoculation for small-pox is known and practised at Kurechane.^a The population is estimated at 16,000, that of each of the Latakoos, 4000.

These different tribes, under the government of particular chiefs, who are often engaged in war, are nevertheless united by language, manners, and customs. Being great travellers, the Betjouanas all know each other well; the sons of good families, and principally of the chiefs who aspire to the succession, are constrained to make long journeys, for the sake of forming friendly connexions and alliances useful to their tribe, in case of necessity.

Less tall than the Caffres, and as well proportioned, their form is even more elegant; the brown tint of their skin is between the shining black of the negro and the brownish yellow of the Hottentot; the form of their face exactly resembles that of the Caffres (Koussas); excepting that more frequently the nose is arched, and the lips like those of the European; the expression of their eyes, and a certain something about the mouth, often gives them an appearance of men possessing great sensibility without refinement; the free and harmonious play of their countenance, of their gestures, and of all their muscles, reflect, as from a mirror, the movements of their minds; their language is sonorous, rich in vowels and aspirates, and well accented; an elocution approaching to chanting, joined to great sweetness, gives it all the charm of the Italian.^b

Desirous of information, they assail strangers with questions; and the excess of their curiosity is often troublesome. To gratify their curiosity, they handle every thing new to them, and they beg it, if they are at all pleased with it; yet a refusal does not offend, and a look only, or gesture, is sufficient to put a stop to their importunities. The goodness of their memory is shown by the facility with which they retain all the Dutch names, and even entire phrases, which they pronounce better than the Hottentots born in the colony. At a much greater distance from the state of nature than the Caffres, they are masters of the art of dissimulation, and know how to manage their personal interests with address. Always active and in motion, even without any settled occupation, they sleep little during the day; during the full moon, they often pass even the night in dancing and singing. Of moderate desires, they inure themselves to fatigue by running whole days without requiring any other food than that which is presented to them in the uncultivated and naked plains of their parched countries. At home they live chiefly on the curds of milk. Meats furnished by the chase are most agreeable to them; they seldom kill cattle. They eat the flesh of the hyæna, the wolf, fox, cat, rhinoceros, and swan; they even be-

come, it is said, in certain circumstances, anthropophagi; they have, however, an unconquerable aversion to fish, nor will the greatest hunger force them to eat it. The ashes in which they roast their meat are substituted for salt, which is entirely wanting in their country. They drink water only in the greatest extremity; they do not even use it for washing themselves. They do not understand, like the Koussas, the process by which a fermented liquor is extracted from seeds; but they immediately and gladly accept wine and brandy given them by Europeans. The use of certain herbs, both in the form of smoke and of powder, was familiar to them long before the arrival of the Europeans; they have also given to tobacco the particular name of *montiouko*, while the Hottentot tribes, who also smoke wild herbs, especially the dakra (*Phlomis leonurus*) have adopted, in their language, the shortened word *twak*.^c The Marootzes cultivate tobacco, both for trade and home consumption.

Their clothes are neat, and made of the skins of different animals, such as civets, jackals, wild cats, and antelopes. The men conceal their nakedness under a leathern bandage, like the Jagas, and the women wear several aprons, one over the other; they also cover with care the breast, leaving the belly uncovered.

Among their ornaments may be observed rings made of yellow copper, six or eight of which hang from each ear; elastic bracelets also of the same metal, and large ivory rings surrounding the lower part of the arm. Not having saws, they soften the ivory in milk, and then cut it with considerable difficulty with a knife. They appear to possess the art of making brass-wire; for the fine copper wire which they very ingeniously wind round a tuft from the tail of a giraffe to make their bracelets, is quite a peculiar metal, and this kind of merchandize does not form an object of exchange with European vessels employed in African commerce. Yet M. Lichtenstein counted seventy-two of these bracelets on the arms of one woman. They are manufactured at Kurechane.

The construction of their houses and stables is very superior to that of the other inhabitants of Southern Africa; but the women have alone the merit of it. The form of their houses is generally circular; the arrangement of the parts appears to vary according to the situation and season: the interior is light, clean, and well ventilated. Pottery is also another kind of industry reserved for the women; they use, in its formation, the same ferruginous clay, mixed with mica, that serves them for anointing their bodies. Their pots are exactly hemispherical, and without feet; and, notwithstanding their want of thickness, are very strong. They also make pitchers very narrow at the mouth, in which milk may be kept fresh for a considerable time.^d The Betjouanas also shew much cleverness in smith work. Their instruments are hammers and pincers of the same form as ours, only a little more clumsy; a large stone serves them as an anvil. They understand tempering iron, and the making of steel; and, although badly furnished with tools, undertook to repair the carriages and iron tools of the Dutch who came to see them. They highly valued the saws, files, chisels, and nails, shewn to them, and immediately understood their use. The bark of several trees, and the filaments of several species of

rush, furnish them with materials for making strong pack-thread. The art with which they cut figures on the sheaths of their knives, which they hang round their necks, on their hassagays, spoons, and other wooden utensils, proves that they do not want genius for sculpture. In some houses at Kurechancee, there are figures, pillars, &c. carved or moulded in hard clay, and painted in different colours, that would not disgrace European workmen. They know how to paint and to glaze their pottery. Ivory, rushes, leather, wood, clay, stone, are all ingeniously wrought. Their iron is remarkably fine.

The Betjouanas have an idea of a soul, the seat of which they place in the heart; they say of an honest man, that his heart is white. In the same manner, they associate the ideas of wicked and black. Honesty, loyalty, and courage, are with them principal virtues; but the rights of property are not held by them very sacred. They believe in an invisible master of nature, supreme distributor of good and evil, whom they call *murimo*, analogous to *murinna*, king or lord: the sentiment held towards him appears to be nearer allied to fear than love. The high priest who presides over their religious ceremonies, is the second personage after the king. These ceremonies are chiefly the circumcision of boys, and the consecration of cattle. The priests are also employed in the observation of the stars, and the arrangement of the calendar: they divide the year into thirteen lunar months, and distinguish the planets from the other stars. Venus, Sirius, Acharnar, and some others, have particular names, known to few. To religious ideas may be undoubtedly referred the folly of the Betjouanas in prognosticating future events by means of dice, of a pyramidal form, made with the hoofs of antelopes. Their conversion to Christianity was long attempted in vain: they appeared to laugh at our doctrines, and to jeer at our mode of worship. When spoken to concerning the God of peace, they answered, he may be as angry as he pleases, we cannot give up going to war. Of five missionaries, there was only one to whom they shewed any civility or attachment, and that was on account of his having made known to them the use of the plough. Of late, however, they have all expressed the greatest willingness to be converted. There is a mission at New Latakoo, in the very heart of their territory; and every one of the princes visited by Mr. Campbell expressed a wish to have missionaries settled among their people. There is another at Griqua Town, and both are most carefully attended by the natives. Indeed, preoccupied by no other creed, and impressed with ideas of the superiority of Europeans, whom they call *gods*, the open curious mind of the Betjuana cannot be supposed to be obstinate against conviction. The missionaries complain chiefly of their feeble reasoning powers; but, after all, these perhaps differ little from other nations in the same stage of civilization. Wherever the missionaries have settled, the people have become better clothed, more industrious, and have left off the predatory *commando*, which indeed is nothing but an expedition undertaken to deprive the inhabitants of some neighbouring village of their lives and cattle; but to which all the false glory of war is attached in the ideas of these simple men. The chiefs of the Griquas, Tammakas, and many other tribes, now attend with solemn regularity on the preaching of the Gospel: even the wild, persecuted, but not ungrateful Bushman, listens with delight and thankfulness to the mes-

sengers of peace. Communities of Bushmen, to the extent of many hundreds, have been reclaimed from the precarious life of the desert to the blessings of civilized life, and are highly spoken of by their benefactors, the missionaries, for devout and regular conduct. In this direction, where there is no political jealousy, Christianity now makes a rapid and steady progress.

Their arms differ little from those of the Caffres, and consist of the hassagay and the club. M. Lichtenstein does not mention the shield; but many of the tribes use it.^a For some years past, they have also employed against the Bushmen the same poisoned arrows that they seize from these implacable brigands; for they are unacquainted with the mode of making them. The population, instead of being diminished by the frequent wars in which they are engaged, is increased among the victorious tribes, in consequence of the number of women and young children whom they take prisoners. Without being at present acquainted with the slave trade, the Betjouanas already appear to conceive the profit they might make by the sale of their prisoners. They offered to exchange with M. Lichtenstein's companions, children of ten years old, for sheep.

The disproportion between the number of men and women, which is general throughout the countries bordering on the tropic, has given rise to, and perpetuated polygamy, at the same time that it retains the women in a certain state of servility. As soon as a young man can think of establishing himself, he lays out a part of his property in the purchase of a wife, who generally costs from ten to twelve oxen. The first business of the new married woman is to build a house, for which she must herself fell the necessary quantity of wood: in this work she is sometimes assisted by her mother and sisters. The building a stable for cattle, with its inclosure, the cultivation of the fields, and all the household work, equally form a part of the servile duties of a Betjouana woman.

As soon as the cattle are increased in number, the Betjouana thinks of increasing his family by purchasing a second wife, who is equally obliged to build a house with stable and garden. Thus the riches of a man are estimated by the number of his wives. The women are very fruitful, and a Betjouana, surrounded by a numerous family, resembles much one of the patriarchs delineated in the Scriptures.^b

The Barroloos live at the distance of ten days journey north of the Betjouanas;^c they live in large cities; understand casting iron and copper, and carve with taste in wood and ivory; their soil is fertile, shaded by trees, and watered by rivers. This is the account given by the Betjouanas to European travellers; and it is confirmed by the late researches of Mr. Campbell. The Wanketzees, Marootzees, Mashows, Yattabas, and Bouquains, though they speak a dialect of the Betjuana language, are not called Betjuanas, but Boroolongs. The above particulars then apply perfectly, as we have seen, to those nations of the Betjuan territory comprehended under the term Boroolongs. The country is well supplied with wood and water, and very fertile; and they both possess considerable acquaintance with the arts, and trade with nations to the east, having direct communication with the Portuguese.

From the travels of Campbell it appears that the farthest

^a Campbell, vol. I.

^b Lichtenstein, l. c.

^c Barrow, compared with Lichtenstein.

country to the north-west, known to the Betjouanas or Boroolongs, is named *Mampoor*. The *Kallyharry* are a people living a month's journey to the north-west of Latakoo, from whom the latter procure the skins of the wild cat. North of the Orange River lies the country of the Great Namaquas, which, to about lat. 26° south, and long. 19° west, is watered by the tributary streams of the Fish and Orange Rivers, and therefore tolerably fertile; but to the east and north of this lies the great southern Zahara, or desert, extending probably to the equator, and inhabited only by wandering Bushmen. This vast region of sand, studded here and there by trees, is bounded on the eastern side by the Betjuanas, Marootzees, and by other tribes, which they denominate as follows:—north of Kurchancee, the Moquana, Bamangwato; north-east, the Macallaka; east, Bapalange, Massoona; east by south, Bahatja; south-east, Bassetza, Booropolongs, Maribana, Babooklola, Bamoohopa, Bapoohene; south south-east, Bapo, Bammataw, Balicana, Bahooba, Bapeeree, Buklola, Moolehe, Moochoobeloo, Moomanyanna, Mohawpee, Bommaleetee, Peeree. Besides these tribes, or nations, to the south south-east, Barrow and Campbell ascertained, that great hordes of both native and Betjuana Bushmen inhabit the country south-east of Latakoo, immediately behind the Tambookas, and in a line drawn from Port Natal to Latakoo. These Bushmen possess herds of cattle. The Wanketzees are situated to the west of the Marootzees, from whom they are divided by a chain of mountains passing from north-east to south-west; they are commanded by a treacherous prince called Makabba, and at present bear the worst character of all the southern tribes except the Bushmen. Travelling from sunrise to sunset, *Mampoor*, situated on the sea-side, is two moons journey from Latakoo, and three moons when the travellers are incumbered with cattle, the plunder of these being the objects of this distant march. The desert beyond Kallyharry bears mimosa trees, and others, unknown to the Latakoo, somewhat resembling the willow. The surface of this great desert, which reaches from the Namaquas to Long mountain and the Wanketzees, extending 1000 miles to the north, and 500 to the west of Latakoo, is not perfectly level, and though generally covered with sand, has tufts of withered grass in the hollows. The watermelon is pretty copious; water is extremely scarce. There is a nation at its farthest extremity called Quabee, (or Grass Knee.)^b The extent of this desert, as obtained from natives, brings it to the 10th degree of southern latitude; in short, into the country of the Giagas or Jagas of Congo, who, it is evident, are nothing but the wandering Bushmen of the desert, and the desolating commandos of the Betjuanas and Boroolongs. By such inquiries the benevolent labours of the missionaries expand the boundaries of science; but we have to resume the subject of central Africa in the course of the next Book.

In resuming the description of the maritime countries, we shall pass over in haste *Inhambane*, extending from Lagoa bay, as far as Cape Corrientes, where a fort built by the Portuguese points out the southern limit of the possessions claimed by that nation. Cape Delgado is the north-

ern frontier. This whole extent of coast is called the *Government of Sena*, or *Mozambique*. The coast of *Inhambane* is covered with pasturage and destitute of wood.^c Each village has its independent chief.^d The country of *Sabia* contains nothing remarkable. Frequent mention is made of the kingdom of *Sofala* or *Sephala*, but it appears to be only the maritime part of the kingdom of *Botonga*; for *Sofala* denotes in the Hebrew and Arabic languages, *Low Country*.^e Four hundred executioners constantly precede the king of this country, who assumes the titles of *Grand-sorcerer*, and *Grand-robber*. These words perhaps excite in the mind of an African, ideas equally just and liberal, as the phrases applied to the paternal wisdom and august magnificence of our sovereigns excites in the mind of an European courtier. Four ministers traverse the kingdom yearly, one represents the person of the monarch, a second his eyes, a third his mouth, and a fourth his ears.

The golden treasures of this country have become quite a common place among the Arabian geographers; this precious metal, however, undoubtedly came from the interior. The soil is fertile, the climate tolerable. The approaches to the coast are dreaded on account of the numberless reefs and banks of sand. It is asserted that among the inhabitants there is a race of gigantic stature, who deliver up their prisoners of war to a nation in the interior, to be devoured.^f Those residing on the coast have embraced the Mahometan religion, and in some measure the Arabic language. They are ignorant of the art of dyeing their cotton stuffs.

The state of *Monomotapa*, situated behind *Sofala*, is like the latter watered by the *Zambese*, one of the great rivers of Africa, that empties itself into the sea by four mouths or branches; namely, in proceeding from the north to the south, the *Quilitane*, the *Cuama*, which appears to be the principal, the *Luabo*, and the *Luaboil*. The natives say that this river originates from a great lake, and receives its name from a village not far from its source. It is very rapid, and in some places a league in breadth. They ascend it as far as the kingdom of *Sicambe*, above *Tete*, where there is a cataract of an astonishing height, and constant falls for the space of twenty leagues, as far as the kingdom of *Chicova*, where are found mines of silver. The *Zambese* inundates the country in the same manner as the Nile; but in the month of April. In sailing upon this river it is very hazardous to plunge the arm or foot into the water, on account of the numerous and daring crocodiles.^g *Monomotapa* abounds in rice, maize, fruits and cattle; it is cultivated along the rivers, but the rest of the land, although uncultivated, appears fertile, since vast forests are found there inhabited by elephants, rhinoceroses, wild oxen called *meroos*, tigers strong enough to carry off a calf, zebras, antelopes, and monkeys.^h The hippopotamus and tortoise attain an enormous size. The Portuguese have bred a few horned cattle; but horses are altogether wanting. The mineral kingdom appears interesting. Gold dust every where abounds; the Portuguese collect it in the environs of *Tete*, the natives in the province of *Manica*; in addition to these are enumerated the gold mines of *Boro* and *Quaticuy*, where this precious

metal lies imbedded in a rock. The kingdom of *Butua* is considered the richest in gold. Masses of native silver have been met with. The natives diligently work some iron mines.

The name of *Monomotapa* signifies, according to some authors, the king of *Motapa*: it is written by others *Beno-Motapa*, which, according to an ingenious observation, appears to signify in Arabic "people of mercenary soldiers," and is consequently only an appellative given to these nations by the Arabs, who have conquered the sea-coasts.^a However it may be, the sovereign, to whom the title of emperor is given by the Portuguese, formerly extended his dominion over a great number of vassal kings: he is still, say they, one of the most powerful princes of Africa. The great edifices of *Butua*, covered with inscriptions in an unknown language, appear to be silent evidences of ancient civilization extinguished during the presence of civil wars, or which may have disappeared with the nation, great both in commerce and arms, of which these monuments appear to be erections.

The provinces and cities of the empire of *Monomotapa* are not better known than they were in the sixteenth century. *Zimbae* is the collective name of every great city, like *fou* in China. It is the name of the emperor's residence, which is sixty leagues from the sea; it is a very populous city, and is situated on the banks of the great river. *Tete* and *Sena* are two Portuguese forts; the first, also called *San-Yago*, is one hundred and twenty leagues in the interior, and fifty leagues east of the great cataract. The Portuguese still possess on this river the posts of *Chicova* and *Massapa*, near the gold mines of mount *Fura*. The post of *Zumbo*, where the Banians manufacture gold plate, has been seized from the Portuguese by the natives.^b The people of this country go nearly naked, like those of the western coast; they are superstitious, and believe in magic and enchantments. According to reports which seem doubtful, the king, on days of ceremony, carries suspended at his side a small spade as an emblem of agriculture. The children of the great men are retained at court as hostages; and the king sends every year an officer into the provinces. It is at that time the custom for the people to testify their loyalty by putting out their fires, and relighting them by fire taken from the officer's torch. It is said that the emperor's guard consists of a squadron of women lightly armed. After all, is it ascertained whether this famous monarch exists at present, as an independent sovereign?

A more interesting question for a traveller is the possibility of crossing the unknown country between *Monomotapa* and *Congo*. The Portuguese and African slave merchants have already often conducted convoys of negroes from *Angola* to *Sena*, and from *Sena* to *Angola*. The two posts of *Pedras-negras*, in the interior of *Congo*, and of *Chicova*, in the interior of *Monomotapa*, are the respective points of departure; the distance is three hundred and twenty-five leagues, and its performance occupies a whole season: wandering hordes are frequently met with, and elevated plateaus are crossed where gold-dust is col-

lected. The reports received from Portuguese exiles residing at *Sena*, and transmitted by two learned men, *M. Correa de Serra*, and *M. Constancio*,^c leave scarcely any room for reasonable doubts. The objection drawn from the declaration of the governor of *Mozambique*, who declared himself ignorant of these journeys, loses its weight, when it is considered that it is not at *Mozambique*, but at *Chicova*, or at least at *Sena*, that information of the fact must be collected. Moreover, the governor consulted by *Mr. Salt*, appeared to have scarcely any idea of the circumstances generally known concerning the geography of *Monomotapa*.

Repulsed from the interior, our curiosity must rapidly survey the remaining part of the eastern coast governed by the Portuguese.

The coast of *Mozambique* every where presents dangerous reefs and shoals, interspersed with a great number of small islands. The rivers, although very wide at their mouth, do not come from a great distance; they take their rise from the foot of a long and high chain of mountains, to which, on account of their splintered peaks, has been given the Portuguese name of *Picos Fragosos*.

The port of the Isle of *Mozambique*, although of difficult entrance,^d is very good, and can afford secure shelter to many vessels. The Portuguese have a fort very well built, and hold under their jurisdiction the inhabitants, who are Moors, and are governed by a *Sherif*. The Portuguese ships, on their voyage to *India*, enter and remain in the port of *Mozambique* during a month; formerly, among other merchandize, they took in slaves, which they carried to *India*; but *King Joseph* the second, under the ministry of *Pombal*, forbade this commerce, and the present *Queen* has enforced the order. The principal objects of exportation at present are gold and elephants' teeth: these last are very abundant; they are kept in spacious magazines,^e and are shipped off during the month of *August* every year for *Goa*. There is also considerable trade carried on between this place and *Madagascar*; but all the commerce of these countries appears to be in the hands and for the profit of government.

The unhealthy state of *Mozambique* has induced the inhabitants to build at the bottom of the bay the large and pleasant village of *Mesuril*, at this time more populous than the city.^f The governor's palace raises itself majestically above a forest of cocoa, cashew, and mango trees. The principal nation on this coast is that of the *Macouas*;^g the *Monjous*, and the *Muzimbes*, live in the interior. The name of the first of these nations appears to deserve all the attention of geographers. It appears to furnish the solution of an ancient geographical enigma. The territory of *Vakvak*, or *Wakwak*, extends, according to the Arabians, from *Zanguebar* as far as *Sofala*; it is precisely the situation of the country of the *Macouas*; are not the two names identical? A slight alteration of orthography may have confounded these names in the Arabic.^h Such is the conclusion to which a rational etymology would seem to lead us. The truth is, that *Mucou*, in the dialects of southern Africa, merely signifies a white man, and is applied by the

inhabitants of the interior, indifferently to the Dutch and English at the Cape of Good Hope, or to the Arabs and Portuguese on the shores of Mozambique.^a Anciently, Wakwak may have had the same signification, so rapidly do the dialects of Africa degenerate : and the Makosses of the west coast,^b north of the Orange, probably derive their name from a similar origin.

The northern part of the government of Mozambique derives its name of *Querimbe* from that of a small island where the Portuguese have a fort, and where they allow the French to trade.^c *Oibo* is another of their posts. The islands of this coast are under the government of an Arab sheik, a vassal of Portugal, whose possessions terminate at Cape Delgado.

BOOK LXXII.

AFRICA.

Continuation of the description of Africa.—Eastern coast, or Zanguebar and Ajan.—Remarks on the Interior of Southern Africa.

THOSE regions which are least known attract more particularly the attention of writers who are anxious to satisfy the curiosity of their philosophical readers. We shall, therefore, devote a whole book to the description of countries, which both English and French compilers of geography generally dispatch in two or three pages.

Cape Delgado determines the southern limit of *Zanguebar*, or the coast of the *Zangues*, *Zingues*, or *Zindges*, for the name given by the Arabians to the native inhabitants is written in these three ways. The Arabian accounts are those only which appear to embrace the whole of continental Zanguebar. A great river, filled with crocodiles, sandy deserts, a burning climate, leopards of a large size, innumerable elephants, giraffes, and wild asses or zebras, mines of iron, from which the natives derive their favourite ornaments; the dourah and banana, as alimentary plants; as beasts of burden, oxen, which are also used in war; such are the traits of physical geography which can be collected in the writings of Ibn-al-Wardi,^a Massoudi,^b Edrisi,^c and Bakoui.^d The country of the Zingues, or Zindges, extends, according to the Arabians, from Abyssinia as far as the territory of *Wakwak*, that is to say, to the country of the Makouas, or the coast of Mozambique. It is in length seven hundred *farsangs*, by which are probably meant Arabic miles, for there are just seven hundred of them from Cape Delgado to Madagoxel, otherwise the whole coast from the straits of Babel-Mandel to Sofala must be included. The capital is *Kabila*, a name in which Quilooa may be recognized. The people live without law, and without any definite form of religion. Every one worships the object of his fancy—a plant, an animal, or a piece of iron; they, nevertheless, acknowledge a supreme God, whom they call *Maklandjlo*, a word which calls to mind the *Molungo* of the inhabitants of Sofala, and which thus attaches the Zingues to the race of Caffres. The king, who is said to assume the title of “Wakliman, or Son of the Supreme Lord,”^e marches at the head of 300,000 troops mounted on oxen. The Zingues conquered, during the third century of the Hegira, a part of Eastern Arabia and of Irac.

Europeans have visited only the islands and some maritime places of Zanguebar; we will follow them by ascend-

ing from south to north. The island of *Quilooa*, with the city of the same name, is situated opposite a peninsula, formed by two great rivers, the most important of which is called *Coavo*. This situation gives it three safe ports, spacious, and independent of each other. The banks of the rivers are ornamented by large trees, with villages interspersed, subject to the authority of the king of Quilooa. The island, accessible at all times, is the mart for the slave trade of the whole coast of Zanguebar. The continent produces a species of teak-wood, as durable as that from Surat, of the greatest beauty, and fit for the building of ships. The sugar-cane, cotton, and indigo, are its natural products. The baobab, the tamarind tree, the cedar, the tree that produces gum copal, and the coffee plant of Madagascar, are also found here. Game, and herds of every species of animal, particularly of the wild ox, as well as river and sea-fish, are here abundant. Elephants, rhinoceroses, panthers, lions, leopards, and wild asses or zebras, are often seen coming to the banks of the two rivers to quench their thirst. Fruits and vegetables are scarce. Millet forms the principal food of the natives.

The king is a negro, and receives much respect, but is under the guardianship of a Moorish vizier, called *Malindane*, who governs supremely in the name of this titular monarch, whom he may even depose by conferring the dignity on another of his own choice.^f This vizier appears to be a governor sent by the powerful sheik of the island of Zanzibar. “The inhabitants of this island,” says a learned author, “saw with concern that Quilooa alone had all the trade of the coast; they invaded this city in 1787. The king of Quilooa ceded to that of Zanzibar half the profits annually received from the slave trade. For the better observance of this treaty, the sovereign of the latter island has stationed a representative at Quilooa. Many French trading vessels resort thither every year.”^g The women cultivate millet and potatoes from custom and necessity; the men are employed either in fishing, hunting, or sleeping; the women also make mats and coarse stuffs for their own use.^h

The island of *Monfia*, governed by a sheik in the time of Ramusis, is at this time only inhabited by wild oxen, which the inhabitants of Quilooa go there to hunt.

Zanzibar is the largest and most important of all these islands; it is twenty-five leagues in length and five in breadth. It is said to have an excellent harbour. Orange

and lemon trees display their golden fruits by the side of the cocoa nut and banana. Vegetables and rice are abundant. The inhabitants, like all those of the neighbouring islands, are Mahometans, and governed by a system of laws. The cities are adorned with mosques. The number of inhabitants is computed at 60,000, of which 300 are Arabs, and the rest a mixed race. The sheik communicates with the princes of Arabia; he is said to have expressed a wish to be placed under the protection of England.^a The exports consist of slaves, gum, ivory, antimony, and blue vitriol.^b

Pemba is still more fertile in fruits and corn. The inhabitants, a timid people, are dressed in stuffs of silk and cotton brought from India. Like the other islanders, they sail in their frail barks to Melinda and Madagascar.

Here ends altogether modern information. The interesting descriptions of Lobo, Barros, and Couto, are already three centuries old.^c Is the city of *Mombaza*, situated on an island formed by two branches of a river, still in the possession of the Arabs of Mascat, who, in 1698, drove out the Portuguese? Are the seventeen churches that adorned this city, well fortified by nature and art, still mosques? With whom do the inhabitants of these fertile and healthy places at present trade? Does the large and beautiful city of *Melinda* still continue the pride of these shores? Do they still see in its gardens the most delicious oranges? Do the Arabs, who now possess it, array themselves in silk and purple? Is the king still carried on the shoulders of his courtiers, and received by a choir of priests and young women, who offer him incense and flowers? Who now reigns in *Lamo*, a country famous for the large asses it produces? Over *Pate*, whence the Arabs of Mascat drove out the European traders in 1692? Over *Jubo* and its coast, infested by serpents? Over *Brava*, or *Berua*, a small aristocratic republic, the inhabitants of which worshipped stones anointed with the oil of fish?

These are questions that would have been resolved by the learned and intrepid Seetzen, if an enemy's hand had not cut the thread of a life so precious; for at the moment in which this traveller died, poisoned by the order of the Iman of Yemen, he was preparing to visit Melinda, and to collect among the Arabs of that city traditions and manuscripts relative to their knowledge of Africa.

But the principal features of geography are incapable of change.

The cities of Melinda, Lamo, and Pate, appear to be situated in the delta of a great river, called *Quilimancy*, which appears to be the same as that which, under the name of *Zeebe*, descends from the mountains of Abyssinia. The banks of the river, inundated and enriched by its waters, perhaps may correspond with the lively descriptions of the Portuguese; farther on, the moving sands, according to an Arabian author, have destroyed the city of *Lamo*.^d

Behind these maritime and civilized states are noticed the savage tribes of *Mosegueyos*, rich in cattle, who, during infancy, have their heads covered with clay in the form of a cap. Is not the name by which this nation is designated

Arabic? it would then only signify men armed with javelins.^e Farther north are the *Maracatas*, a people less rude, and having a good exterior. They observe the ceremony of circumcision. The girls preserve the treasure of their innocence by means of a suture, which the husband alone has a right to undo.^f

The accounts of the kingdom of *Magadoxo* or *Makadschou*, are more recent. A Lascar or Indian sailor, named Isuf, who has resided there sixteen years, has furnished the principal parts of the following account.^g The country, watered by a large river, abounds in corn, rice, fruits, cattle, red-haired sheep, horses, and camels. The extensive forests harbour bears! lions, panthers, leopards, and ostriches. The *pyon* is a bird ten feet in height. The description of an amphibious animal, denominated *bozer*, calls to mind the *Ornithorinchus* of New Holland. The population consists of a mixture of white, olive-coloured, and black men, who have pretty generally adopted the idiom of their masters, the Arabs. The king and great men are covered from the breast to the feet; the common people go nearly naked; the queen, by way of distinction, wears a robe of green silk, and her hair is ornamented with feathers of different colours. The king holds a court of justice in public, assisted by some counsellors. Criminals are either exposed to wild beasts, or dispatched with a club. The king is attended by a suite only during journies; at other times he has neither court nor guards, nor does any one salute him. The Mahometan religion, which prevails, appears allied to paganism; for different idols are seen both in the temples and houses. The violence exercised by the Portuguese in former times on this coast, who came for the purpose of procuring slaves, has left a deep impression, and Europeans are no longer received but with mistrust and much reserve.

The capital, which takes the name of the country, is a large and fine city, built at a short distance from the seashore. It contains the king's palace, several mosques, and houses of stone painted in fresco, with flat terraced roofs. In the burial place of the royal family, near the city, the tombs are of black and white marble, each adorned with a cupola surmounted by a magnificent pyramid. The urns enclosing the ashes of the kings and queens are all of gold, and surrounded by lamps of the same metal.

It is probable that the *Machidas*, mentioned by the Abyssinian historians, are no others than the *Makadschou*.

The coast of *Ajan*, presents to the eye of the navigator, only a desolate mass of rocks and sands, where, occasionally, may be seen a wandering ostrich. In proceeding round Cape *Guardafui*, the eastern point of Africa, the coast puts on a less barren appearance. The port of *Felis*, the isle of *Barbara*, the commercial city of *Zeila*, in a country producing fruits and corn, are little frequented by Europeans. The kingdom of *Adel* is the principal state of this coast, its capital is called *Auca-Gurel*, and the sovereign, like that of Yemen, assumes the title of *Iman*.^h The inhabitants of this coast, called *Berberes* by the Arabian geographers, have an olive colour, long hair, and do not in

^a Salt, Second Voyage to Abyssinia, &c.

^b The Iman of Muscat, in alliance with Britain, and aided by a British fleet, has extended his power along the coasts of Arabia and Africa, from the Persian Gulf to Zanguebar. The city of Melinda is now in ruins. The British have also aided him with their troops against the Wahabites in the interior of Arabia.—P.

the least resemble the Caffres. The horns of the cows are as large as those of the stag; the sheep have also some peculiarities; according to Hamilton,^a they are white, with a head of a shining black colour, small ears, large body, and juicy flesh; at the end of their tail, as broad as their buttocks, and from six to eight inches long, is an appendage also, about six inches in length, very like the tail of a hog. Hamilton's assertion is in some degree confirmed by Bartheima,^b who states his having there seen sheep whose tail weighed from twenty-five to twenty-six pounds; they had the head and neck black, the rest of the body white; others, entirely white, had a tail an ell in length, twisted like a vine, and the neck swelled with a kind of dewlap hanging to the ground, which they have in common with the Angora sheep, and some other varieties. M. Walckenaer has justly remarked their identity with a ram of antique marble,^c the living type of which is said to exist in the Alps; it appears to us, however, that the artist must rather have seen its model in Asia Minor. The sheep of Adel, instead of wool, is covered with hair as coarse as the bristles of a hog. The same effect is produced by the climate of Guinea and Barbary.^d The ancients were well acquainted with these Ethiopian sheep, as they called them.^e Our European breed, after having been transported to South America, has changed its wool for hair.^f These facts appear to diminish, in a great degree, the importance commonly attached to slight varieties of form, in a species so subject to the influence of climate.

Among the exports of the country of Adel, some Greek and Roman authors of the first and second centuries, name myrrh, frankincense, cassia, and cinnamon.^g The testimony of the ancients, repeated by Bartheima, has also been copied by Bruce. It is not improbable that the forests or groves, overspreading the interior mountains of Adel and Ajan, produce medicinal gums, odoriferous resins, and aromatic barks. We have seen, in the description of Guinea, that even the western coast of Africa produces some aromatic vegetables. We consider a great resemblance between the Flora of Africa and that of Arabia and India, as a probable result, not only of the similitude of climate, but of the commercial communications of the inhabitants. Have not some plants from Brazil flourished in the neighbourhood of Plymouth, the seeds of which had been transported by Portuguese vessels to Lisbon, and thence to England? Are not the vegetables of Germany diffused in the same manner over the coasts of Bergen in Norway?^h It must be confessed, however, that Bruce's assertions do not afford sufficient evidence for admitting the cinnamon, cassia, or even the coffee-tree, into the list of vegetables of the central region of Adel and Ajan. Myrrh only is at this time carried from the ports of Abyssinia to that of Moka.ⁱ

It now remains for us to penetrate farther into the interior of the continent. Unfortunately a few lines will be sufficient to include the vague traditions that have reached Europeans.

The *Giagas* or *Jagas* traverse immense deserts to the east of Congo. It is asserted, that these Tartars of the

torrid zone, after having joined the *Mou-Zimbes*, appeared as devastating conquerors on the coast of Quiloa. On the other hand, the name of *Mou-Jaco*, placed by Battel and Dapper very far to the north-east of Congo, appears to point out a temporary establishment of the *Giagas*. It appears to us that the *Zimbes*, or *Mou-Zimbes*, must be identical with the *Cimbebas*, wanderers to the west of the *Betjouanas*. Again, the *Mon-Gallos* or *Mou-Gallas*, on the coast of Quiloa, appear to be an emigration of the *Gallas* bordering on Abyssinia. It is from these data that the interior of Southern Africa appears to us an extensive plateau, where wandering hordes are dispersed without control, without laws, or any regular employment. This hypothesis appears confirmed by the two according testimonies that we are about to cite.

The accounts of the slave merchant of Mozambique, collected by Mr. Salt, inform us, that the two nations, called the *Eevi* and *Maravi*, are situated nine hundred miles at least from the eastern coast, and consequently in the middle of the continent: these nations, composed of white men, (olive-coloured are undoubtedly meant,) are concerned in the slave trade on the western coast. Seven months are required to go from Mozambique into their country, where a great lake of fresh water is to be found. This testimony merits greater attention, as the English traveller, in reporting it, endeavours to throw doubt on the subject.^k

According to M. Morice, of the Isle of France, who concluded in 1776, in his own private name, for one hundred years, a treaty of alliance and commerce with the *Moors* of Quiloa, a caravan of Africans every year leaves this city, which goes though the interior of the country to the western coast of Africa, and returns by the same road. They feed on the vegetables and fruits found on the road,^l and particularly on the tamarind. At the distance of some day's journey from Quiloa, a great lake is observed, designated as a fresh water sea; it is undoubtedly the lake *Maravi*. It is crossed on pieces of wood, and a halt is made on an isle found in the middle. The Africans assert that the termination of their journey is "a lake" of salt water. Vessels, similar to our own, are found there, and Europeans, to whom the slaves are sold. This account has been confirmed to M. Morice, in all the voyages which he has made to Quiloa, by many inhabitants who had performed the journey; and the coincidence of their reports does not admit a doubt of its truth.

From these reports, it may be presumed, that at present there are no considerable nations, even half-civilized, in the southern interior of Africa. This idea is farther confirmed by what is known concerning the manners of some tribes.

Immediately to the east of Congo, are the regions where are found the wandering and barbarous tribes, called *Jagas*, *Giagas*, or *Schaggu*, by travellers, and who give themselves the name of *Agaghi*.^m These people do not cultivate the soil, and possess only such cattle as they take in war; they invade the fertile countries of their neigh-

hours, consume the produce, and, after having laid every thing waste, search after other booty. The Jagas devour their prisoners; they rub their generalissimo with human fat; he also wears a belt of ostrich eggs, and a sort of copper ring in the nose and ears. The women of the Jagas bury their children alive; the nation continues its existence only by rearing the children of neighbouring nations, torn from their parents at twelve years of age. The generalissimo, during the great sacrifices, kills with his own hand human victims. It is asserted that, at a certain festival, this chief orders a furious and hungry lion to be let loose in the middle of his subjects. The Jagas, far from avoiding it, consider it an honour to be killed by his murderous teeth. Old men, and the sick, are abandoned without pity. The dead are buried in vaulted tombs, dressed in their richest clothes, and have, as companions, two of their wives, who are buried alive. The Jagas, who have no horses, fight on foot with great intrepidity; they intrench their camps with diligence. This hideous nation has had its Alexander and its Semiramis. Under the command of *Zimbo*, they overran the interior of Southern Africa, and came down to lay waste Quiloa and besiege Mozambique. On its arrival before Melinda, the army of *Zimbo* suffered a total defeat, which was followed by the dissolution of his empire; but *Temba-Ndamba*, grand daughter of one of his generals, endeavoured by her laws or *quizillas* to restore the power of the nation. With a view of enforcing submission to her inhuman commands, she seized her young son, threw him into a mortar, crushed and pounded him, and then extracted from his wretched remains an ointment, some drops of which she applied to her body on every day of battle. The Jagas have preserved this ointment; and their chiefs, when anointed with it, consider themselves invincible.

The *Bororos*, to the north of Monomotapa, are a less barbarous people. The people who inhabit the shores of the lake Maravi, and who have considerable cities, are subjects of the empire of the *Bororos*. Among the names of these tribes, those of *Massi* and *Ruengas* are the most remarkable: the one recalls the ancient Massyli and Masæyli; the other appears identical with *Dar-Runga*, situated to the south of Darfoor, since this last people use an idiom entirely different from that of their neighbours, and appear therefore to be a colony come from a great distance.

The name of *Mono-Emugi*, or, according to a more authentic orthography, *Mou-Nimigi*, designates an empire or rather an oasis to the north of the lake Maravi. It is said to be populous, mountainous, and rich in gold mines.^a These mines are found in the province of *Goragua*; it is also known, from M. Seetzen, that in Dar-Bergoo, a dialect is known, called the *Gourangon*, which appears to indicate a province of the same name. The sovereign of *Mou-Nimigi* has the title of *aceque*, which is like the Berber word *amazeagh*, lord. Thus some scattered rays every where show a connexion between the nations of the southern interior, and those of Atlas and Nigritia. The *Mou-Nimigians* are said to be white, undoubtedly only as compared to negroes.

Only one part of this interior region has been visited by Europeans; it is the small state of *Gingiro*. Some parti-

culars concerning it are known, furnished by the Jesuit Anton-Fernandez, who attempted, in 1613, to pass from Abyssinia to Melinda, with an embassy, designed for King Philip the second of Spain.^b This country is situated on the banks of the *Zeebe*, which has its source in *Boscham*, a district of the kingdom of Narea,^c and opens for itself a passage across the mountains, dividing the two countries.

This river, which moves along a greater volume of water than the Nile, after having nearly surrounded *Gingiro*, which becomes in this manner a sort of peninsula, pursues its course, without interruption, to the sea, into which it empties itself near Melinda. To cross it in their country, the *Gingirians* kill a cow. They enclose the baggage in the skin, and fill it with air by blowing into it with force. They then fasten to it two poles, in the form of shafts, hang upon each side by pairs, to keep the machine balanced, which a good swimmer, placed at the head, draws by means of a rope, while two others push it on from behind. Their colour is of a less deep black than that of the negroes. Their features are as fine and regular as those of the *Abyssinians* and *Europeans*. The whole nation are slaves; every thing is the absolute property of the king. When he wishes to obtain any thing valuable brought by the merchants, he gives them in exchange the number of slaves required. For this purpose, he merely orders as many sons and daughters of the inhabitants as he wishes to be taken away. It is a right of the throne, consecrated by time; and wo to the person who is suspected to disapprove in the least of this barbarity; he will be immediately put to death. At his audience of leave, the king offered Father Anton-Fernandez the daughter of one of the first families of the kingdom as a slave, and on his refusal gave him a male slave and a mule. The crown is hereditary in the same family, but not in the order of primogeniture. The successor is appointed by force, at the peril of the electors' lives, who pass for great sorcerers, and appear to be a tribe of priests. After inauguration, the new king orders all the favourites of his predecessor to appear before him, and orders them to be sent after their beloved master into the other world. The house of the dead king is burnt, with every thing contained in it. The same is done after the death of an individual: even the trees and vegetables found in the neighbourhood are burnt, lest the spirit of the departed, habituated to the spot, should be tempted to return and haunt it. Before felling a tree, chosen to make the pillar intended as a support to the throne in the king's new dwelling, they cut off the head of the first man they meet belonging to a certain family of the kingdom, which, from that circumstance, is exempt from all other burdens, and many envy this honour. When the king goes to be installed in his palace, one or two other men of the same privileged family, according to the number of gates, are killed, that the threshold and posts may be dyed with their blood. On the day of his assuming the reins of government, his first act is to give orders for discovering throughout the whole of his kingdom all the men and women who are affected with scald-head, in order to prevent the propagation of the disease, which might terminate in affecting his majesty. The whole are cured by being sent beyond the *Zeebe*, where death awaits them all.

^c "The *Zeebe* is probably the *Wadi Borcha*, which, according to Makrizi, constitutes the frontier of Abyssinia." Vater Ethnographisch. Archiv. I. 242.

The king is seated on his throne, which is like a balloon, fixed in the manner of a cage at the top of the house, dressed in a robe of white silk of Indian fabric. Father Anton-Fernandez says, that *gingiro* means a monkey, and that the attitudes and grimaces of the king in his cage very much resemble this animal, adding, that similar to what monkeys do, the king, wounded in battle, is immediately killed by those who surround him, or in default of that by his relations, that he may not die by an enemy's hand. He is looked upon as a divine being, rival to the sun and his devouring influence. He goes out only in the morning, at break of day. If the sun has risen before him, he continues in the interior of the house the whole day, and neither goes up into his cage, nor transacts any business; for, say the Gingirians, two suns cannot shine at the same time, and when the other has taken the lead, the dignity of the king would be compromised, if he so far humbled himself as to follow.

After death, the body of the king, dressed in the richest stuffs, and enclosed in the skin of a cow, is drawn along the

fields to the burial place of the sovereigns, and deposited in a ditch left open; earth is not considered worthy of covering the remains of the rival of the sun, who can only have the canopy of heaven as a mausoleum. The body is inundated with the blood of a great number of cows killed by the side of the grave; and afterwards, one is killed every day, until the death of the king then reigning; the blood flows into the grave, and the flesh is the property of the priests who perform the sacrifice.

Among other ceremonies of inauguration, too long for description, the new king is obliged to crush between his teeth a certain worm brought to him, and which is supposed to have come from the nose of his predecessor.

Such are the rude and extravagant manners of the population of Central Africa. They afford little hope of interesting discoveries for history; neither, however, can it be supposed that a small number of men, well armed, would experience many obstacles in traversing these barbarous regions.

BOOK LXXIII.

AFRICA.

Continuation of the Description of Africa.—The Eastern African Islands—Socotora, Madagascar, Bourbon, Isle of France.

ON quitting the continent of Africa at its eastern point, the Island of Socotora^a immediately comes into view; its soil is dry, stony, and almost entirely destitute of water and vegetation: the sands of the shore are carried by the wind even to the summit of the central chain of mountains. Nevertheless, in the sheltered valleys, the best kind of aloes, as well as a great quantity of dates, are produced. It abounds in goats and poultry, but there are very few oxen. Besides the *mosunbrun*, or gum extracted from the aloe, cinnabar and dragon's blood are exported from the island.^b George Andersen, an unenlightened traveller, mentions his having there seen the cassowary. Ambergris is thrown up from the sea. Coral is very common, and the houses of *Tamarida*, the principal town, are constructed with it. The island has no perfectly secure harbour. It is governed by a sheik, who is subject to the Iman of Muscat or Arabia. The population of this island might furnish a subject for lengthened discussions. Philostorges, Edrisi, and Hamdollah, speak of a colony sent hither by Alexander the Great. During the time of Philostorges, the colonists spoke the Syriac language. Marco Polo assigns an archbishop to the Christians of Socotora. The Portuguese found there some Monophysite Christians, whose prayer-book appeared to be written in the Chaldean language. Again, in 1593, there was a Jacobite bishop in the island;^c but the sect of Nestorians also had followers under a separate bishop.^d Thomas Roe, among modern travellers, gives the most particular details of the inhabitants, and divides them into four classes—the Arabians, rulers of the country; their Mussulman subjects, or slaves; the *Bediognes*, ancient inhabitants confined to the mountains, who profess the doctrine of the Jacobite Christians; and lastly, a savage tribe, who live in the woods, without either clothes or houses. Its present inhabitants appear to be ignorant of the use of the musket, but, in commercial and other interested transactions, appear to partake of the vices of civilized nations.

This island, which even in periods of antiquity served as a station for merchants, might even now become an important one, to any nation wishing to trade with Arabia and Eastern Africa. Yet, since the sixteenth century, it has continued to be disregarded by Europeans.

At the distance of three hundred marine leagues south of Socotora, are a great number of small archipelagos, dis-

covered by the Portuguese, which, even at this period, are not well defined. On the charts prior to the *Oriental Neptune* of M. d'Apres de Manneville, the general name of *Almirante*^e Islands comprehended all those small islands situated between the 4th and 6th degrees of south latitude, and the 50th and 54th degrees of longitude E. from Paris. Within about forty years, many French navigators have made more observations, and have changed the nomenclature: they have applied the name of *Almirante Islands* to the more western group, composed of thirteen flat islands, furnished with fresh water, abounding in cocoa trees, and tortoises, often readily taken by the hand of travellers. A more eastern group has got the name of the *Seychelle Islands*.^f The largest, the isle of *Mahe*, is remarkable on account of the establishment formed there by the French, wherein they cultivated with success the nutmeg and clove trees. An excellent port renders this island important to navigation; the English on this account have taken care to have it ceded to them. It was to this spot that Napoleon, when first consul, exiled some turbulent friends of liberty, falsely accused as accomplices with the contrivers of the infernal machine. A quarrel with the inhabitants, probably on the subject of politics, was the cause of these unfortunate persons being again exiled. Some of them foundered on the Comora Island and were lost; others gained the African continent, where they probably suffered a slower and more painful death; at last, destiny also conveyed to an African island the man by whose orders so many victims had been exiled to the centre of the Seychelle islands.

The *Isle of Palms*, in this archipelago, is distinguished by a peculiar production, a species of palm, producing a fruit called the *Maldiver nut*, or *Coco de mer*. In this fruit there is nothing particular, except its form, which presents an appearance of two thighs. The kernel, which resembles that of the cocoa-nut, has a bitter and astringent taste.^g As the tree grows near the sea, the nuts, when they fall off, drop into the water, and are carried by the current as far as the Maldiver Islands, whence they are carried to India. Very singular medical virtues were formerly ascribed to its fruit; it was sold at a very high price. The Emperor Rodolphus the Second, could not procure one at the price of 4000 florins. The learned formed different hypotheses on the origin of this nut, and Rumphius considered it the production of a sub-marine tree. The palm tree producing it has only been found in this island; but as the sea carries it as far as Sumatra and Java on one side,^h and

Zanguebar on the other ;^a it probably grows in many other islands of the Indian ocean. The French and English having in a short time diffused a great many of them through India, this fruit lost its mysterious fame. It has, however, been found profitable to cultivate it in the Isle of France.

Many small islands, little known, among which are the *Seven Brothers*, *Diego Garcia*, *Adu*, and *Candu*, extend eastward from the Seychelles, to the Maldives, and even beyond the meridian of the Isle of Ceylon, in the direction of Sumatra. The are all uninhabited. To the south-west of the Seychelles, are also observed many small islands and extensive reefs uniting this archipelago to Madagascar and Africa. Thus, that part of the Indian ocean which extends from the coast of Zanguebar to that of Malabar, and from Arabia to the Seychelles and Maldives, forms a kind of separate sea, or, if it may be so called, a mediterranean sea.

The usual entry to this sea is the *Channel of Mozambique*, between Madagascar and Africa. To the north of this channel, interspersed with shoals and rocks, is the archipelago of the *Comora Islands*.^b They are four in number. That of *Anjuan*, or *Johanna*, properly *Hinzuan*, has a great advantage over the others in its commodious roadsteads, and watering places of easy access. It has a very picturesque appearance ; mountains, shaded with trees and fine verdure, varied by glens and intersected with deep valleys, majestically raise their heads one above another to a height of five or six hundred toises, and terminate by a peak more lofty, covered with eternal vegetation. The whole island appears to have undergone the action of a considerable volcano ; traces of the violence of fire are every where to be met with. It may contain about six or seven thousand inhabitants. The bay of *Machadou*,^c the usual place of disembarkment for European vessels, is on the north side. The town is about half a league from the anchorage, and is surrounded by walls fifteen feet high, and flanked by square turrets.^d The town of *Johanna*, situated on a handsome bay in the eastern part of the island, was destroyed by the Malgaches^e in 1790.

Angazija, or great *Comora*, situated twenty-five leagues to the north-west of Anjuan, is a vast assemblage of mountains, the different groups of which have their bases very near the sea-coast, and all unite in a common summit, of from twelve to thirteen hundred toises in height. It has no roadstead, but many villages.

Mohilla,^f or *Malale*, five leagues west-south-west of Anjuan, is encompassed with a chain of rocky shelves. It has two small towns.

The isle of *Mayotta*, the smallest of the four, seven leagues south-south-west of Hinzuan, affords only one bad anchorage. Its population is reduced to twelve or fifteen hundred individuals.

Situated under a fine sky, the Comora isles enjoy a very healthy climate. The country every where exhibits the appearance of a luxurious vegetation. At Hinzuan, every defile is a garden watered by a limpid stream. The sum-

mit of each eminence^g is covered with wood, its foot is shaded by groves of cocoa, mango, orange, and lemon trees, and tufts of bananas, intersected by fields of potatoes and yams. The Indian purging nut,^h the guava, the tamarind, and other trees less known, adorn the sides of the hills ; wild indigo and the sugar cane are abundant.

The principal domestic animals are the goat and the zebu.ⁱ In the fields are found pintados and quails, as well as several species of turtle-doves ; among these is one very beautiful ; its plumage is ash-gray, shaded with blue, green and white ; its neck and legs are extremely long, its bill is yellow and much pointed. The brown maki appears to be the only inhabitant of the forests.

Numerous flocks of a species of hawk fly near the surface of the sea. This bird, in its size and plumage, resembles the sparrow hawk ; it is so far peculiar, that it lives only near the coast, feeds only on fish, and yet is not possessed of any of the characters that distinguish aquatic birds ; its feet are not even half-webbed. The waters of this archipelago are not very well supplied with fish.^k

In the Comora isles none of those troublesome insects are found that desolate India, the coast of Africa, and the island of Madagascar ; but the fields swarm with small mice.

The population is composed of negroes intermixed with Arabs, who, at the period of their numerous emigrations about the twelfth century, established themselves in these islands as well as on the coasts of Africa and in Madagascar.

Thick lips and prominent cheek-bones assimilate the lower classes to the blacks of Mozambique ; the sultan and nobles have retained the fine and expressive countenance of their Arabian ancestors ; large eyes, an aquiline nose, and a well-formed mouth, are features common to them all, and among them are observed heads of a striking character. The common idiom is a mixture of Arabic and of the language of Zanguebar.^l

The Comorans are, in general, mild, honest, hospitable, very affable, and have already attained a degree of civilization not to be found in the inhabitants of that part of the continent, or of the great island to which they are neighbours. They have much politeness in their manners, good sense, cultivated understanding, and a certain poetic turn, that imparts to their conversation an eastern grace. Yet although many among them can read and write, they keep no register either of public or private occurrences, and, whenever disputes arise, the truth of facts, and their date, are decided by the oldest persons among them. Europeans shipwrecked on these islands have always experienced the most generous treatment. Some Arabs engage in agriculture, and possess large estates in the interior of the island. Others are employed in the mechanical arts, weaving, working in gold, &c. Their skill in working is as wonderful as the badness of the tools which they make use of. Others apply themselves to navigation, and undertake voyages as far as Bombay and Surat. The natives, however, are generally very bad soldiers, cowardly and pusil-

^l Grosse's Voyage to India, 43. (Germ.) Bruns, in his Africa, conjectures that Carmolah, in Edrisi, is Comora ; and that in place of *Nanah*, the proper reading is *Zanah*, that is to say, *Zuanah*, one of the names given to the island of Hinzuan.

lanimous. The Madecasses frequently make descents on these islands, carry off cattle, and reduce men, women, and children to slavery.

Their houses are simple and even miserable. The women's apartments are separated from the body of the house by a small inner court, inaccessible to strangers. The only appearance of luxury among them is the immoderate use of musk, the smell of which completely infects the houses; they have also the eastern custom of tinging their nails of an orange colour, extracted from the *henna*, so much celebrated by the poets of the east. There is nothing remarkable in the dress of the men. The dress of a woman of rank, whom M. Collin, of the Isle of France, saw on the terrace of one of the houses, appeared very similar to that of the Indians on the coast of Malabar. She wore several necklaces and bracelets of coral, long ear-rings, and a ring of gold passed through the cartilage of the nose; her hair was covered with ornaments. She appeared handsome, but her colour was very brown.

Mahometanism is the religion of the country, but the common people worship Fetiches, as well as attend the mosques.

The sway which the sultan of Anjuan exercised formerly over the Comora Isles, has ceased, on account of the weakness to which the state has been reduced, by the wars waged by the Madecasses since the time of Beniowsky. The nobles have a share in the government, are engaged in commerce, and are the purveyors to European vessels. Little is known of the constitution and laws of this country. Theft is punished by the loss of a hand, and a second offence by that of the other hand.^a

A short passage brings us to one of the largest islands of the world, to a country more interesting from the variety of curious objects it presents, than from its extent, and from the importance it might possess in the hands of an active nation. The island of *Madagascar*, the indigenous name of which is asserted to be *Madecasse*, can claim its share among the traditions conveyed to the Greeks and Romans, concerning the immense Taprobane, which, according to the accounts of the natives, was situated so far to the south, that neither the constellation of the Bear nor the Pleiades were there visible, and "the sun appeared to rise to the left." These particulars, as well as its dimensions, and the great lake situated in the centre of the island, agree with Madagascar, while the latitudes marked by Ptolemy apply to Sumatra, and all the other circumstances lead us to Ceylon. In the island *Phebol*, so named in a writing attributed to Aristotle, may be recognized the Arabic name of *Phambalou*, given to this island. The Arabians probably visited it in their earliest voyages to India, and long before the time of Mahomet. The first certain idea of it was transmitted to us by Marco-Polo. The Portuguese, who discovered it in 1506, under the command of Lourenço Almeida, gave it the name of *Saint-Laurent*,^b the French called it *Dauphine*.^c

This island is more than 340 leagues in length, and in some places, 120 in breadth, giving it 28,000 square leagues of surface.^d Although almost wholly comprised within the torrid zone, it affords, on account of the eleva-

tion of its surface, the most agreeable variety of seasons, and enjoys in some degree all the advantages of temperate climates. A double chain of mountains, from twelve to eighteen hundred toises high, traverses it from north to south, enclosing, in all probability, a sort of central plateau, which separates the two maritime parts almost equally, and gives rise to several rivers abounding in fish, and subject to periodical inundations. The most considerable are the *Murundava*, on the western coast, the *Mananzari* and the *Manangara* on the eastern. The *Andevourante* is navigable for canoes to the distance of thirty-five leagues. The *Manguru*, one of the finest, rises from the lake *Antsianaze*, twenty-five leagues in circumference. Four other lakes, *Rassoï-Be*, *Rassoï-Massaïe*, *Irangue*, and *Nossi-Be*, extend along the eastern coast, communicating with each other; the latter, in particular, would make an excellent harbour, if the tongue of land separating it from the sea could be cut. The sea, however, it might be feared, would soon form another impediment. These stagnant lakes render the climate unhealthy.

Many bays and roads, in different parts, upon the same coast, have often attracted the attention of the French government, since the time of Henry IV. who first entertained the design of occupying the south-east part by erecting in *Dauphine* bay fort Dauphin, at present in ruins. During the last century, Cossigny, and after him Beniowsky, attempted to form establishments in the north-east part of the island, in the fine bay of *Antongil*, in which is port Choiseul. The bay of *Saint-Lucia*, to the north of *Dauphine* bay, was explored in 1787 by M. Lislet-Geoffroy.^e Foulpoint and *Tamatave*, situated nearly in the centre of the coast, have always been frequented by the French, who thence obtained many articles of the first necessity, for the use of their colonies in the Isle of France and Bourbon. English ships generally put into *Saint-Augustin* bay on the western coast. The bay of *Louquez*, between the bay of *Antongil* and *Cape Ambre*, is neglected; it is, however, considered a good harbour, and capable of receiving whole fleets.

Upon the whole, the situation of Madagascar at the entrance of the Indian Ocean, and opposite the south-east coast of Africa; its fertility, progressive elevation, and the varied exposure of its soil; the different modifications of the air, which, in an extent of fourteen degrees from north to south, is favourable to the cultivation of all vegetables peculiar to hot and temperate climates; in a word, every thing tends to make this island one of the most important in the world, in regard to colonization and commerce.^f Its possession is become still more important since the loss of the Isle of France, which, moreover, would never have answered for a great marine establishment, indispensable to every power wishing to establish itself in India on an advantageous and firm footing. On the other hand, Madagascar abounds in convenient anchorages, in timber, and all kinds of provisions.

This fine island is so rich in productions, that a long time would be required to become acquainted with them all. It is strewn with rock-crystal; pieces of the greatest beauty are found, even twenty feet in circumference; the sands

of this island, which are only the remains of this rock, would make very white glass; garnets, very fine black agates, and many other precious stones of inferior quality, are also found. The mountains contain tin and lead, but particularly iron, mines of which were formerly worked by the natives. There appears also to be copper, pale gold, and other metals.^a In the western part, beds of rock salt are also found.

The whole shore is rich in wood. The *ravinale* grows in the marshes, and along the rivulets; it resembles the palm-tree in its trunk, and the banana in its leaves. These provide the Madecasses with napkins, table-cloths, dishes, plates, and spoons; if cut into, when they first appear, a water fit to drink is procured: the wood is used for the building of houses. In the fields and forests are found many trees and shrubs, useful both in the arts and for the purposes of life: such are the *hazame*, a tree of the shape of a poplar, the fruit of which affords the resin *tacamahaca*,^b the *tanoma*, another resinous tree; the *sago* tree producing the alimentary and pectoral substance called *sago*, the leaves of which are used to manufacture stuffs in high repute; the pyramidal *badam* tree; the aromatic *bachibachi*; the *malao-manghit*, producing a nutmeg; the *rharharorac*, two species of *coffee-tree*; the *ravine-sara*, or clove cinnamon, a valuable tree, the nuts and leaves of which have an exquisite perfume; an essence and oil is procured from it, more esteemed than that of the clove; the *voaé* or *voaène* shrub, affording elastic gum; many varieties of the cotton-tree, particularly that known as the largest species; the *malgache* indigo plant, in sandy situations; *mimosas*, among others the mimosa-lebbek, called *black-wood*; it yields a sort of gum copal, the greater part of which is lost under the trees. Among the plants are the ginger, pepper, the curcuma, or Indian saffron, tobacco, in high estimation, rice, and yams of several sorts; the *sanga-fanga*, which has a great analogy with the papyrus of the ancients. This country also furnishes some costly woods, such as sandal wood, and several varieties of ebony, black, white, green and white spotted. The vine flourishes here; and the sugar-cane grows spontaneously. M. Cossigny^c gives a detailed list of more than one hundred indigenous vegetables of Madagascar, that merit being transplanted into the other French colonies; and M. Milbert cites one hundred and sixty-seven brought by M. Rochon to the Isle of France, in 1768.

The animal kingdom, as in all islands, offers less variety. The elephant and lion are unknown, but the *antamba* appears to be a species resembling the leopard. The *farassa* resembles the jackal. The oxen of Madagascar are all zebus, or oxen with bunches of fat on their shoulders; some weigh from seven to eight hundred pounds. Some are entirely without horns; others have horns attached only to

the skin, moveable and pendent. This last species, called in question by ignorant scepticism, has been observed by Flacourt^d and Bucquoy.^e It is also found, according to other testimonies, in the kingdom of Siam,^f and in Paraguay.^g Many Greek and Roman writers have described it in the clearest manner, so that this kind of ox either must have lived formerly in the countries known to the ancients, or must have been brought thither from Madagascar or Siam.^h The simultaneous existence of this animal in Madagascar, and in the Indo-Chinese countries, may be considered as an additional proof of the emigration of the Malays to Madagascar. The other remarkable animals are wild asses, with enormous ears: wild boars, said to have horns;ⁱ goats, extremely fruitful; sheep, with large tails; the *sandrec*,^k a species of hedgehog, proper for eating; the great bat, whose flesh is very delicate; the *makis* and the *ai*, an animal found only in this island. Flacourt adds to these, "the *brek*, or the one-horned goat." The forests harbour fowls, pintados, pheasants, wood-pigeons, geese, ducks, and parrots. Flacourt enumerates more than sixty birds little known. Locusts sometimes darken the air, and are considered dainty food by the natives. Four species of silk-worm are found here, which suspend their coods to the trees. The waters of Madagascar swarm with fish, and the shores abound in different sorts of crustaceous animals and shells, which attract the passenger's attention. Sitting under a lemon-tree near the sea-shore, during the ebb, Mandelsloh made an excellent meal by seasoning the oysters taken at his feet with the juice of the lemons that hung over his head. The whales that frequent this part of the sea, particularly during the rainy season, are a peculiar species:^l it is that of the Indian ocean, found as far as the coast of Brazil. Important fisheries might be established here.^m Shark fishing might also be profitable.ⁿ

We shall now describe, principally from the Memoirs published in our *Annales des Voyages*, the different provinces or countries into which this island is divided, beginning with the eastern coast, then passing to the districts in the centre, and terminating with the western coast.

The country of the *Antavarts*, that is to say, "People of Thunder," because storms generally rise in that direction, reaches from Cape Ambre to within a few leagues of Foulpoint, and comprehends the great bays of Vohemare and Antongil, as well as Isle St. Mary, called in the country, *Nossi-Ibrahim*. It is well cultivated; and particularly abounding in rice, of which 3,000,000 pounds might be exported every year. The Antavarts manufacture very fine cotton cloths, much esteemed in commerce, and make frequent excursions to the Comora Islands, to seize slaves, since Beniowsky shewed them the way. They understand the use of fire arms, and are formidable enemies.^o Some have considered them descendants of the Jews. They cer-

tainly preserve traditions concerning Noah, Abraham, and Ibrahim, Moses, and David; practise circumcision; celebrate the Sabbath; and sacrifice animals.

The province of the *Bestimessaras* or *Betsimicaraes*, or united people, formed by the union of the *Zaphi-Dzabais*, the *Zaphi-Dieunisois*, the *Antantsicanes*, the *Anterouibais*, and others, is the most frequented by Europeans. They buy here a great quantity of rice, and much cattle. There are two excellent roads, Foulpoint, where the French had an establishment, and Tamatave, which perhaps is a more advantageous one. The *Bestimessaras*, governed by *Malates*, or chiefs of white extraction, who tyrannize over them, are the handsomest men in Madagascar, but dissembling, drunken, cowardly, and addicted to theft. M. Chapelier,^a who describes them in this unfavourable light, nevertheless adds, that they are very industrious, and susceptible of civilization.

Farther on we meet with the *Betanimenes*, or people of the Red-land, otherwise *Sicouas*, bounded on the west by the *Bezonsons*, and on the south by the *Antaximes*; governed by the natives of the country, they enjoy great tranquillity. It is the finest, most fertile, and most populous among the provinces on the sea-coast, and its inhabitants are the mildest and most sociable of the whole island. It is generally traversed to visit the interior, because it is more clear of wood than the others. The traveller every where finds a good reception, and his eye is continually delighted by a variety of agreeable situations, as far as the majestic mountains of lake Nossivee and Besoure, which terminate the landscape. The country owes its fertility partly to the river *Andevourante*, named after the capital of the *Betanimenes*, which is also the largest town of Madagascar. It can furnish 10,000 armed men.

The *Antaximes*, or people of the south, are represented as poor, uncivilized brigands,^b without industry or commerce. They even neglect the cultivation of their land, watered by the two finest rivers of Madagascar, the *Man-guru* and the *Mananzari*. The air is much more healthy than in the northern part, but there is no good harbour, so that Europeans avoid this inhospitable coast.

The islanders of this part are of a very black colour, with frizzled hair. They use a shield, which is not the case with the other *Malgaches*.

The country of the *Antambasses* reaches, to the south-eastern extremity of the island, from the Bay of Saint Lucia as far as the extremity of the valley of *Amboule*, a distance of about twenty-five leagues, and as far from north to south. *Siangourih* is its capital. The men are tall, robust, always cheerful, mild, and generous, but idle to excess, and live in the greatest wretchedness. The women do not in general attain the natural height; as in other parts, they are generally ugly, and very debauched. *Dauphine bay* is on this coast.^c

Warm chalybeate springs are found in the valley of *Amboule*; also excellent pasturage, and fine rice-fields, but little wood: the mountains surrounding it are burnt up as far as a third of their height. From seven to eight hundred oxen, and from twelve to fifteen thousand weight of rice, may be procured from it yearly.

The *Antanosses* on the south, and the *Taissambes* on the west, formerly united in one nation with the *Antam-*

basses, are at this time governed by chiefs of the same Arabian family which at that time was in possession of the whole southern part of Madagascar.

We will now pass into the interior. The *Antambanivoules*, or *Ambanivoules*, that is, the inhabitants of the land of bamboos, less corrupted than the people of the sea shore, are considered by these as uncivilized. Shepherds and husbandmen, if they are without refinement, they at least avoid its vices. They lead a frugal and laborious life, and are very hospitable. They sell to their neighbours, particularly to the *Betsimicaraes*, who would otherwise perish of want, rice, poultry, honey, and *toc*, a drink made with the fermented juice of the banana and the sugar-cane.^d

The *Antsianakes* inhabit the district between the sources of the *Manangara*, and the confines of the country of the *Antavarts*. They were considered robbers, because they refused admission into their territory to the white robbers, but peaceable travellers have lately visited their villages, well regulated and tolerably well built, their plantations of rice, and their mountains, whence, it appears, they obtain silver. The salubrity of the air of this country would render it particularly favourable for the residence of a European colony, who would find positions easy of defence. Indian merchants enter it from the country of the *Seclaves*, situated to the north-west.^e

The province of the *Bezonsons* or *Besombsons*, comprehends fourteen villages, situated in a valley encompassed by high mountains, that divide them to the east from the *Betanimenes*, and to the west from the *Antancayes*. The traveller is surprised, in crossing these mountains, to see at his feet well cultivated plains, watered by many streams, and to find an assemblage of men perfectly isolated, living peaceably, enjoying the pleasures of life without dreading its vicissitudes, and anxious to share them with him.

Until now, handsome, black, and well-made men only have been seen; here the features are sensibly altered, and announce a mixed people, and at the same time mark a line of distinction between the different races.

The difference is still more strikingly marked in the *Antancayes*,^f who exactly resemble the Malays in their features, in the tawny colour of their skin, their straight and rough hair, low stature, in their dress, language, and manners. Like the Malays, they consider their beauty to consist in having black teeth; they pluck out the beard, lengthen their ears by piercing them with great holes, and rub the body with tallow, which makes them very dirty. They are deceitful and perfidious, like the Malays. Their chiefs are cruel and despotic, having the power of life and death over their subjects, a custom unknown in other parts of Madagascar, where the criminal is tried in a general assembly.

The province of *Antancaye* is a plain eighty leagues in length, fifteen in breadth, bounded on the east by the mountains of *Befour*, and on the west by the *Manguru*, that washes the foot of the mountains of *Ancove*. This immense plain is covered with innumerable herds of cattle. A sort of red and highly nutritious rice is grown here.

The towns, placed on the tops of the highest mountains, are well fortified, and almost impregnable.

The province of *Ancove*, bounded on the east by the Manguru, touches at its western part the country of the queen of Bombetoc, and the province of St. Augustin bay. It is subdivided into two parts, the northern and southern, is governed by separate chiefs, who, although relations, are continually at war. This country enjoys a pure and wholesome air, but cold. It is much in want of wood, and the inhabitants are obliged to have recourse to stubble, to the dung of oxen, and to a red earth, hardened by the sun, to cook their food, and warm themselves. The population is prodigious; the plains and tops of mountains are covered with villages. *Tanane-Arrivou*, the capital of the most powerful of the two chiefs, may contain twenty-five thousand inhabitants; it is situated on a very high mountain, and has the appearance only of a labyrinth surrounded by ditches.^a

The inhabitants of *Ancove*, called *Hovas*, or *Ambolans*, are very unhappy under their tyrants. Letters, however, from the Isle of France, inform us that their king has lately ceded all the territory to the north of his kingdom, as far as the bay of Louquez. They have but few oxen, but possess a great many sheep with large tails; rice, manioc, potatoes, pistachios, yams, beans, and the vine, are the principal vegetables cultivated for their subsistence. They resemble much the Antancayes; but they are whiter, tall and well made, although with somewhat slender bodies. Their hair is soft and long, the nose aquiline, and the lips small, like those of the Indians.^b

Of all the tribes dispersed over the surface of Madagascar, that of the *Hovas* is the only one that comes near to us in their knowledge of the arts. They extract from the bowels of the earth many kinds of iron and lead ore; this last mineral is used to give a varnish to their earthen ware, each piece of which, whether large or small, is always made in the form of a jug mounted on a pedestal. They work in metal as well as the Europeans, and imitate with great ease most of the objects of foreign manufacture shewn to them. I have seen, says M. Chapellier, knives, scales, and a spring movement, the polish of which surprised me not less than the pains these islanders had taken to imitate their models. They imitate piastres so well that many merchants have been deceived by them. They understand making many fine and very durable stuffs: it is they who furnish those webs of calico^c so highly valued, which are sold in Madagascar at a slave a-piece. It is a stuff of a blue ground, on the sides of which are small bits of tin, very artfully worked, so as to be continuous and closely united into one with the wool, which is always of silk and cotton. In the middle of this tissue are many fine flowers, embossed with tin, which produce a brilliant effect. Their stuffs in general are very close and strong, an advantage not possessed by those brought to them from Europe; in consequence, the inhabitants for the most part are not anxious to acquire the latter. In other respects they are deceitful, treacherous, and cunning; even selling each other. A European,^d while trading for slaves in this province, after having bought a certain number from an accredited merchant, was much astonished on the following day to see another who wished to sell him the very merchant with whom he had just been trading.

The *Hovas* also makes slaves of the *Andrantsayes*, a tribe of shepherds, uncivilized and cowardly, who join them on the south, and who are in the habit of purchasing peace by offering their enemies herds of cattle as a tribute. Every thing concurs to establish the opinion, that this is the nation of *Quimos*^e of which Commerson, the Abbé Rochon, and Raynal, make mention, and which they place exactly in the same spot. M. Fressanges, having had an opportunity of seeing a dwarf slave of this province, took the greatest pains to ascertain this fact. The seller told him that these deformed beings were really not very uncommon among the *Andrantsayes*, but all the slave merchants assured him that in no part did there exist a tribe of dwarfs; nevertheless, these merchants ought to be well acquainted with Madagascar, as they traverse the island in all directions. Having inquired of the dwarf whether his father and mother were also as small as himself, he answered positively in the negative, and that it was on account of his being so small that he had been sold. M. Fressanges has not even heard the word *Quimos* pronounced throughout the whole of Madagascar, and when by the sport of nature, a dwarf is born, they call it *zaza coute coute*, or child man.

We shall now take a view of the southern and western coast. After the country of the *Antanosses*, or the province *Carc-Anossi*, terminated by the river *Mandrerei*, three others are observed along the coast, that of the *Ampatris*, the *Mahafalles*, and the *Caremboules*, neither of them well cultivated, but rich in wood and pasturage. Wild hogs and wild oxen appear to be masters of this country. The tree *Anadzahu* acquires a gigantic height. In the interior live the *Machicores*.

That part of the island called by navigators, the province of the bay of *Saint-Augustin*, is not well known. It would appear that the coast at least, which is low and sandy, has the indigenous name of *Siveh*. The inhabitants are called *Buques*. Their king resides at *Tulcar*. Shipwrecked Europeans have experienced here the most humane attentions; their property has not only been respected, but the natives have assisted them in building their huts, and have provided them abundantly with eatables.^f This last circumstance does not coincide with the account given by other travellers concerning the barrenness of the country, which, according to them, produces only tamarind trees, and some roots, the ordinary food of the natives, with the addition of the milk of their cattle.^g The *Yonggelah*, which runs into Saint-Augustin's Bay, descends from mountains where gold, topazes, rubies, and other precious stones, are found.

The bay of *Murundava* receives a great river of the same name, which is also called *Menabe*, and in the early accounts, *Mansiatre*. This river receives, from the north and south, many considerable streams. In the valleys, watered by these branches, several nations are known; among these the *Erindranou* are the most powerful. The *Vohits-Anghombe*, who are placed near the sources of the *Menabe*, appear to us to be identical with the inhabitants of *Ancove*.

The whole coast, from *Murundava* on the south, to *Ancuala* on the north, belongs at present to the kingdom

of the *Seclaves*, which, at least in several places, is continued into the interior as far as the chain of central mountains. This country, full of plains and meadows, feeds a prodigious number of cattle.^a The lands, generally of an indifferent nature, particularly along the coast, are traversed by regular roads, guarded by picquets of soldiers. The rivers have no fish, but the forests abound in game, and the coast is covered with banks of pearl-oysters. The government, in 1791, was under the authority of a queen, who resided at *Bombetoc*, or *Ampampetoca*, a very populous city, although built in the form of a village. *Mouzangaye*, a well regulated city, with a population of 30,000 souls, among whom are 6000 Arabs and Indians, who appear to be under the sole protection of the queen. The port was frequented by vessels from Surat, which brought cloths in exchange for gold dust.^b There are mosques, houses for education, and workmen of every kind. The *Seclaves*, oppressed by despotism, are less warlike than the eastern *Madecasses*, although they possess the same religious and moral ideas.

In the northern extremity of Madagascar, volcanoes are said to be in a state of activity, but these districts have not yet been examined in detail.

The entire population of Madagascar amounts to one million and a half, according to those who estimate it at the lowest, and to four millions, according to those who estimate it at the highest point. It is made up of many races. Some tribes, or rather castes less numerous, are evidently of Arabic origin. The *Zaffe-Ramint* trace their descent from *Imina*, the mother of *Mahomet*. The chief of this family was formerly the acknowledged sovereign of the greatest part of the island, but the direct line of these princes is extinct. The *Rhoandrians* are their nearest descendants, and born without any mixture. The *Anacandrians* and the *Ondzassis*, are the offspring of an intercourse with the natives. The olive colour of these descendants of the Arabians, accords to them the title of white, or *malate*. The *Zaffe-Ibrahim*, of whom we have already spoken, are descendants either of Jews or of Arabians, who left their country before the time of *Mahomet*. In the district of *Matatane*, a third caste, less warlike, but learned,^c and of a good form, came to establish themselves here at a more recent period. They are called *Kassi-Mambou*, and by the natives *Anta-Mahouri*, which, according to *M. Collin*, signifies inhabitants of the land of the Moors. Their colour, more allied to black, and the woolly nature of their short hair, point out the Arabic colonies of *Zanguebar* as their native country. All the considerable tribes, however, who constitute the great majority of the inhabitants, have either the fawny complexion and the straight hair of the Indians, or the black skin and the frizzled hair of the *Caffres*. It appears that this island was peopled by very ancient emigrations both from *Caffraria* and *Malabar*, that although its

position is nearest to Africa, yet that the periodical winds and a chain of islands connect it with Asia. The name of *Malegaches*, assumed by the ancient inhabitants, that of *Mal-Dives*, or *Male-Bar*, and others, point out this descent, which, as far as regards the Asiatic emigration, is still more completely demonstrated by the composition of the prevailing language of Madagascar.

This language offers some Arabic words, and others allied to the idioms of the *Caffres*; but its principal roots may be traced in the Malay, or in the dialects derived from that language, and spoken in Java, at *Timor*, in the *Philippines*, in the *Marian isles*, and in all the archipelagos of northern and southern *Polynesia*. The most remarkable natural objects, the greater part of the numerals, and the days of the week, have the same names in the two languages.^d There is the same want of declensions and inflexions, the same mode of uniting words, the same abundance of vowels. Notwithstanding what has been advanced by the learned continuator of the German *Mithridates*, we can affirm that the *Madecasse* appears intimately connected with the Malay languages, and particularly with the *Javanese* and *Timorian*. In what proportion are the *Caffre* or *Zanguebar* words? Are they sufficiently numerous to induce us to consider the primitive population as an African colony, subjugated and civilized by the Malays? What influence must be attributed to the Arabs, and from what period? These are questions which the present state of our knowledge does not allow us to solve.

The *Madecasses*, or *Malegaches*, live for the most part in a state of unbridled liberty. The *Seclaves*, the *Antan-cayes*, and the *Hovas*, groan, however, under the yoke of a tyrannical government. Independently of these states, the *Madecasse* acknowledges no supreme authority except the *cabares*, or public assemblies; it is in these that public affairs are decided, and that law-suits are tried. The speeches there made often evince a natural and energetic eloquence. Among many of the tribes, hereditary classes are acknowledged, the privileges of which are not well defined. The *Voadrisi*, are the native sovereign lords, subjugated in some cantons by the Arabians. The *Lohavoits*, are lords who govern in their villages. The *Oudzoa*, constitute the people. There are besides numerous slaves. Similar to what takes place in the South Sea Islands, the right to kill certain animals, and to eat certain meats, is reserved to the higher classes.

The deplorable superstitions to which the *Madecasses* are subjected, are mingled with some notions respecting good and bad angels, borrowed from the Arabians. The priests, called *Ombias*, practice medicine, and sorcery; they also possess some books in the *Madecasse* language, written in Arabic characters. No ceremony is mentioned which can be considered as forming part of a public worship.

Circumcision is in use throughout the whole island, although the Malegaches are not acquainted with the religion of Mahomet. It is also performed with particular ceremonies, giving no indication of Arabian tradition. On the day set apart for this festival, all work ceases in the village. Parents bring, laden with a great quantity of strong liquors, as many oxen as they have children to circumcise. After having slaughtered the oxen, they place their horns on notched posts. Dances, feasts, and sham-fights, announce the opening of the ceremony. The *empananguin*, armed with the fatal knife, demands his victims. Then the sports cease, fathers hasten to present their children, and while they amuse these innocents, the empananguin cuts off what he considers superfluous, places the strips upon a board, and applies astringent powders to stop the bleeding of the wounded part. Guns are loaded, each with a piece of the skin cut off, instead of ball, and a general discharge is made. The ancient custom obliged the empananguin to swallow the strips. Feasts and dancing recommence, and do not cease until there is no longer any strong liquor left.

The ordeal by poison, or the tanguin, is one of the most atrocious superstitions of this people. The tree that furnishes the *tanguin* is very widely diffused throughout Madagascar;^a birds avoid its foliage, reptiles dread its shade; a species of crab alone approaches it. It has a nut shaped fruit, which, taken in a certain quantity, causes death in less than an hour, if the unfortunate victim is not saved by a violent evacuation; even then he is afflicted during the rest of his life with violent pains. This terrible punishment is inflicted on those whom the hatred or the jealousy of the people accuses of having caused the death of one of their compatriots. It is considered a sort of *judgment of God*, to whom is remitted the decision of a criminal process. The *cabare*, or assembly of the people, is consulted before they go to this extremity; the relations and friends, both of the person dead and the person accused, superintend the ceremonies that precede and accompany the operation of the tanguin. If the accused survives (which happens in about one case in five) the accusers become his slaves.^b

The *Dine* is an imprecation, in the form of an oath, invoked upon the head of one, or several chiefs. The formula of this oath consists in these words: "I swear that I am not guilty of that of which I am accused. If I speak false, may such a chief be destroyed by thunder, or changed into *such* or *such* an animal, by the power of the Supreme Being." The accused being impeached and convicted of perjury, is condemned to slavery by the chief towards whom he directed his oath.

A custom more worthy of human nature, is the *oath of blood*, or solemn alliance contracted between two persons, who bind themselves to perform to each other every sort of good service, and hence acquire all the rights of relationship. For the purpose of celebrating this ceremony, the principal persons of the place are assembled. The

new friends wound themselves slightly in the pit of the stomach; then soak two pieces of ginger in the blood that flows, and each eats the piece moistened with the blood of the other. The person appointed to perform the ceremony, mixes in a cup some fresh water, salt water, rice, silver, and gunpowder; these are called witnesses of the oath; he dips two lances in this mixture, and, striking them with the instrument by which the wound was made, he pronounces terrible imprecations, generally couched in these terms: "Great God! master of men and of the earth, we invoke thee as a witness to the oath we have sworn: may the first who breaks it be destroyed by thunder; may the mother who conceived him be devoured by dogs!" then, driving away the evil genius whom they believe always ready to oppose good intentions, they dart their javelins towards the four cardinal points. They call to witness the earth, the sun, and the moon, and drink a little of the beverage prepared by the master of ceremonies, exhorting all the powers to convert it into poison for him who does not take the oath with sincerity.

In sailing one hundred and eighty leagues eastward from Madagascar, the *Mascarenha* isles^c come in view; for by this name must be called collectively, after the person who discovered them, the isle of *Bourbon*, or *Mascarenhas*, properly so called; the *Isle of France*, called *Cerne* by the Portuguese, and *Mauritius* by the Dutch; and the islands of *Rodriguez*, and *Cargados*, which complete this archipelago.

The Isle of Bourbon^d seems to be entirely composed of two volcanic mountains, the origin of which, says M. Bory de St. Vincent, is undoubtedly at two periods very distant from each other. In the southern part, which is the smallest, the subterranean fires still commit ravages; that of the north is much larger; the volcanic eruptions that formerly made great devastations, are now no longer in action: species of basins or valleys; rapid rivers, hemmed in by perpendicular ramparts; hillocks thrown into these valleys, by which their course is impeded; basaltic prisms, often disposed, as in the island of Staffa, in regular columns; beds of lava in great variety; deep fissures, that indicate a general convulsion; all attest ancient and dreadful physical revolution. The narrow beach, interrupted in several places, is composed, as at Teneriffe, only of rolled pebbles of basalt or other lavas; these stones are washed into the sea by the rains; true sands are no where to be found; what is improperly called by that name is composed of calcareous rubbish and of marine bodies thrown upon the shore by the waves, or it exhibits in miniature a collection of all the lavas of the island, which the motion of the tides has reduced to very small round pieces, of a bluish slaty appearance.^e

What is called the Windward part, comes into view on approaching Saint Denis by sea; it is the pleasantest part: that called the Leeward, is considered the most luxuriant; but is somewhat arid; springs are scarce. The former,

^a The tanguin, (*Pentandria monogyria*.) Flowers terminal and paniced; corolla infundibuliform, with five oblique rose-coloured divisions; throat closed by five scales, furnished with a whitish down; tube very long, channelled and villous within; stamina sessile; anthers supported upon threads which adhere to the tube of the corolla, and have at their summit a projection in the form of a hook, on which the stigma is supported; the style slender, equal in length to the corolla; stigma capitate, villous at its top. Calyx with five whitish pointed divisions; the three exterior large, the two interior smaller; the peduncle long and greenish; each bifurcation of the panicle enveloped at its base by

a concave and whitish bractea. Leaves thick, petiolated, oblong, entire, and bordered by a cartilage. (MS. Note of M. Chapelier.)

^b Mem. Manuscrit de M. Collin.

^c "Iles Mascareignes." *Mascarenha Isles* is not found in the English geographies. *Mascarenhas* is the Portuguese name for the island of Bourbon, from Pedro Mascarenhas, its discoverer.—P.

^d Called by the Portuguese, *Mascarenhas*, by the French, *Bourbon*, and afterwards *Reunion*.—P.

^e Bory de St. Vincent, *Voyage aux Iles d'Afrique*, t. I. p. 264; II. 372; III. 147.

more even, rising from the sea by an easy ascent, to the summit of the island, tempered by continual breezes, and cultivated with care, often recalls an idea of Europe, and particularly of Languedoc, while at a distance the nature of the vegetation is not distinguished. Plantations of clove trees, resembling pleasure groves, immense coffee plantations, and golden fields of corn, agitated by a continued waving motion, adorn this country, of which they constitute the wealth.

The port of *Saint Denis*, alone affords access to this island; it is an open road. The mole, constructed by the orders of M. de la Bourdonnaye, has been carried away by the waves. *Saint Denis* is not properly a city; it is literally a village, the streets of which are bordered by pallisades or walls, resembling country highways. There was a French establishment in this isle as far back as 1654. M. Poivre, author of the *Voyage of a Philosopher*, was governor of these islands in 1776, and introduced the cultivation of the clove with great success. They are also partly indebted to him for the bread fruit tree, the nutmeg, and cinnamon. The soil of the island is, in general, excellent; but as it is composed almost entirely of one great mountain, the rains attracted by it carry along towards its base the light particles of the soil that owe their existence to animal and vegetable deposits, so that the summit of the mountain is merely a naked and desolate rock, at the same time that the land becomes better as it approaches the sea-shore. The cantons situated on the leeward coast, enjoy a climate and temperature very favourable to the perfection of the coffee-tree; but unfortunately this very effect contributes to the multiplied growth of insects that destroy the plants. Its produce is estimated at 73,200 bales, of about a quintal.

The culture of cloves, on account of its extent, is next to that of coffee in importance; but the cultivator can never reckon upon its produce with certainty; it is very abundant one year, and very deficient another. In the present state of its culture, the produce is estimated, in an abundant year, at one million and a half of pounds.^a Cotton is at present less cultivated than it was formerly, particularly since a disease ravaged the plantations. This disease, the nature of which has not been made out, does not affect the vigour of the plant, but prevents the development of the seed, and reduces the product to a mere nullity. This inconvenience, in addition to long commercial interruption, has induced the cotton planters to convert their lands imperceptibly into plantations of corn and coffee. The produce of corn is about 14 millions of pounds weight. It formed the principal resource of the Isle of France, for the Isle of Bourbon does not consume more than two millions of pounds in the year. Maize and potatoes are also cultivated. The total product of the island is valued at 7,100,000 francs.

In the Isle of Bourbon, the grants of land are very vaguely determined. Instead of fixing the extent by a given measure, they merely specify, that lands situated between such and such rivers or ravines, and those that are extended from the sea, as far as the declivity of the mountain, are the property of such a one. These rivers, however, which, during the rainy season, are liable to change their bed, often ruin by their inundations a considerable part of the lands, and produce, by this disorder, a considerable depreciation in the farms. To appreciate the utility of an

exact limit, it must be observed, that such lands as have been surveyed, and inclosed by land-marks indicating their limits, have always paid double, treble, and even four times more than they had done before this operation.

The revenue raised by government in this island, arises from a capitation tax laid on the negroes, and from direct taxes upon carriages, palanquins, and horses, registers, and stamps, and from licenses for the sale of arrack.^b The duties on the importation and exportation of merchandize are not productive. The whole public revenue may be estimated at 1,150,000 francs. The royal domains are of considerable extent, but in a great measure in the hands of runaway or rebel negroes. There is also a considerable part of them on the coast, consisting of lands of very good quality. In 1811, the population amounted to nearly 80,350 inhabitants; of these 16,400 are whites, Europeans or creoles; 3496 free negroes, and 60,454 slaves. The armed force amounted to 4493, composed of 573 troops of the line, 417 creole sharpshooters,^c 900 national guards, 2300 creole militia, and 145 pieces of artillery.

The *Isle of France*, less fertile, and of less extent than that of Bourbon, is indebted to its harbours and roads for a greater commercial and military importance. It was the centre of the French navigation in the East Indies. It was the point from whence issued those indefatigable privateers, the terror of the opulent English. Conquered at length by a formidable English army, this rich and warlike island has been left in the hands of a power, which will, no doubt, appreciate the valour, public spirit, and talents of this little nation.

The Portuguese looked on this island in no other way than as a watering place. The Dutch, who established themselves here in 1639, made known its fertility;^d having been attracted, however, to the Cape by a prospect of greater gain, the inhabitants abandoned it in 1712. It was only about the year 1734, under the government of M. de la Bourdonnaye, that the French establishment began to be of some importance. There are two harvests annually of wheat and Indian corn; they are not, however, sufficient for its consumption. The coffee is of an excellent quality: the clove retains all its perfume; the cotton and indigo plants find many favourable spots for growth; but the fickle nature of the inhabitants, always looking out for novelty and profit, induces them to pass rapidly from one kind of culture to another.

There are in this island many of the smaller breed of monkeys, who do a great deal of harm to the plantations. The jacquier, and the rima, another tree rather different in appearance, are here cultivated under the name of the *bread-fruit tree*, but the bread-fruit tree, so much celebrated by navigators, has only recently been introduced into the colony. It is still scarce, because it is difficult to propagate.

The form of this island, according to M. Bory de St. Vincent, is an irregular oval: it is rather more than eleven leagues in its greatest length, which extends from northeast to southwest, and rather more than eight leagues in its greatest breadth, which is from east to west. The reefs render disembarkation in general dangerous. By following the different windings of the coast, its circumference is found to be about forty-five leagues. The land rises gradually from

^a Conquest of the Island of Bourbon, in 8vo. London, 1811.

^b See the pamphlet quoted above.

^c "Tirailleurs."

^d Valentyn, Oostindien, t. VIII. Kaapsche Zaaken, p. 155.

the coast. The centre of the island is a wooded plateau of from 200 to 250 toises high. In the centre of this table land rises a conical pointed mountain; its situation has given it the name of *Piton du milieu de l'île*, or Central Peak, which is 302 toises in height. Among the other mountains, that of the Black River is 424 toises high; that of *Pieter-Both* has on its conical summit a mass like a cap, which seems to threaten the surrounding country with its fall.

From the top of the Pouce may be distinguished to the north certain volcanic islands, that appear to form part of a submarine crater. Between these rocks and the mountain stretches a low level plain, where are found only some fragments of lavas which belonged to ancient currents, all the rest is calcareous, consisting of madrepores and shells formed at the bottom of the sea.^a

Port North-West, or Port Louis, (the name of the city situated at the point of debarkation,) may contain 4000 whites, or free blacks, and double that number of slaves. The houses are almost all built of wood, but elegant in their forms. The public buildings are of a very good architecture. The principal streets are planted with black-wood, a handsome tree of the genus *mimosa*, the flower tufts of which, in the spring, form an agreeable contrast, by their white, yellow, and delicate rose colours, with the new and dense verdure; but this tree soon loses its leaves, and becomes loaded with dried husks.^b This city is not without its scientific and literary institutions; the *Societe d'Emulation*, which is formed here, has enriched our *Annales des Voyages* with very interesting memoirs.

In traversing the interior, to go to *Port Bourbon*, the second town, the road passes through a delightful country, where the dwellings of the colonists are so many temples raised to gaiety and hospitality; in a short time the traveller is immersed in humid forests, decked with mosses; he makes his way over the rapid and foaming torrent, by leaping from rock to rock; he takes his rest by the noise of cascades, by the murmur of zephyrs perfumed with the sweetest odours; he enjoys those pastoral scenes so eloquently traced by the pen of the author of Paul and Virginia, assisted by the ingenious pencil of M. Milbert. In a northern direction, the romantic district of *Pamplermouses* presents to the lovers of botany the celebrated *Jardin de l'Etat*,^c where the vegetable riches of the whole east flourish. These details, however, are too well known to appear in this work; we must only point to our readers the chart of the island, by M. Hubert Brué,^d as the most accurate, in which they may follow, in their excursions, the numerous travellers who have described this colony, for a long time the subject of so much pride to the French, at this day the subject of so much regret. Let us terminate this sketch by some statistical data. The population of the isle consisted in 1806, according to a census, of thirteen thousand nine hundred and fifty-two free persons, and sixty thousand six hundred and forty-six slaves; total seventy-four thousand six hundred and eighteen. It is believed that, at the moment of the conquest, it had reached

the number of ninety thousand souls. The revenue was valued, for the year 1810, at a million, and from 6 to 700,000, francs. It arose chiefly from custom-house duties. Among the principal expenses paid out of the revenue,^e was that for the purchase of corn and flour.^f

The island of *Diego Rodriguez*, which supplies the Isle of France with many thousands of turtle, has lately received some inhabitants. Before that time an incredible number of crabs formed its sole population.^g

In a course directed to the south-east of this island, towards those of St. Paul and Amsterdam, the navigator might perhaps reach the famous island of *Juan de Lisboa*, the doubtful existence of which has so much occupied the attention of navigators and geographers; nor have they hitherto, by their researches, made out any thing satisfactory.

Hugh Van Linschoten, in his chart of the Indian Ocean, published in 1638, delineates two islands, at this day unknown, the one to the south of Mascarenhas, in 26° of southern latitude, called *Juan de Lisboa*, and the other to the south-east of Rodriguez, in 28° of latitude, which he calls the island *dos Romeiros*: they are distant from each other about two hundred and forty leagues.^h

The chart of *Robert Dudley*, author of the *Arcano del Mare*, published in 1647, presents to the south-west of *Maurizio*, two islands, the one called *Santa Apollinia*, the other *Dascaienhas*, and to the east, at a distance of from 3° to 4°, two other small ones, marked simply as English discoveries. No island is marked in that part of the sea where *Juan de Lisboa* is looked for; but this note is found; *The longitude of the island Romeras de Castelhanas* (reckoning from the peak of the Azores) is 98° and a half, and the latitude 28° 20'.

Texeira's chart, printed in 1649, points out to the south of Mascarenhas, in 26° of latitude, the *Island dos Romeiros dos Castelhanos*, and to the south-east of *Diego Rodriguez*, another island called *dos Romeiros*, distant one from the other more than 290 leagues.

Pieter Goss, in the chart published by *Van Keulen* in 1680, places the island of *Juan de Lisboa* to the south of Mascarenhas, in 26° and a half of latitude, and the *island dos Romeiros dos Castilhanos*, in 28° and a half of latitude, and 15° to the east of the meridian of Mascarenhas. But in another chart by *Van Keulen*, much more modern, we find only the island *dos Romeiros*, situated in 28° of latitude, and 11° and a half to the east of the meridian of Mascarenhas or Bourbon.ⁱ

The various conjectures of later hydrographers, being founded entirely upon individual opinion, afford less interest.

D'Anville, in 1727, unites the two islands *Juan de Lisboa* and *Romeiros* into one, and places it immediately to the south of Bourbon, under the name of the *Island dos Romeiros dos Castilhanos*, or of *Juan de Lisboa*; but rejects it altogether in 1749. *Dapres de Manneville* makes no farther mention of it in his *Eastern Neptune*.

Thus, after having during nearly a century prolonged

^h *Dos Romeiros* occurs in G. Mercator's map, by his son, 1593: both it and *Juan de Lisboa*, in Maginus Ptolemy, Anb. 1617. *Dos Romeiros*, lat. 28°, 36°, 39°. South, and long. 90°, 80°. East: in different maps. *Juan de Lisboa*, lat. 28° South, long. 86° East of Terceira. Both places are probably from Vertomann.—Ed. Ptol. Mag. p. 25. 177. 284.

ⁱ Memoir of M. Buache, amongst those of the Institute, Sciences Mor. et Polit. t. IV. p. 91. sqq.

its uncertain and wandering existence in the charts, at one time alone, at another in company with one or two islands, under the name of dos Romeiros, or even itself by that name, the island Juan de Lisboa appeared to be overwhelmed in the depths of the ocean, like the supposed southern continent.^a Nevertheless, a tradition of its existence, preserved among some descendants of pirates, established in the isle of Bourbon, gave it new interest about fifty years ago. In the Isle of France were handed about, notes and extracts of obscure, incoherent, and contradictory journals, to which, however, some importance was given by the comments of European geographers. These notes, added to a memoir on the Isle of Bourbon, presented to the general committee of the Indian Company, on the 11th of February, 1771, established as a principle, "that the island of Juan de Lisboa appeared imaginary to those navigators only who had not found it out." As a proof of this, they declare "that a bucanier had disembarked on it, *not more than six years ago*, and had killed, according to his own account, twelve or fifteen oxen in less than two hours!" They farther bring forward the testimony of a certain M. Boynot, who "assures us that he had seen and sailed round it towards the end of the year 1707, in returning from the Isle of Bourbon to Pondicherry." How is it possible to doubt his veracity, since he has the modesty to assert, that "he is indebted for this discovery to some bucaniers at that time on board his ship, and takes care to tell us that, by passing to the south of Madagascar, he very much shortened his passage," although the assertion is in direct opposition to all that is known concerning the winds and currents in the channel of Mozambique. Farther, this companion of bucaniers observed this island exactly as Teixeira represents that of dos Romeiros, and yet he had not seen the chart of this Portuguese, nor that of Van Keulen, when, *in conversation*, he was spoken to about the island of Juan de Lisboa. "This circumstance renders it credible," adds the note, "that what M. Boynot asserts *is true*, we being convinced that he would not willingly have imposed upon us."

More reliance is placed upon the "authentic discovery" made by Captain Sornin, in passing from the Cape of Good Hope to the Isle of France. This happened on the 1st of May, 1772, in south latitude $26^{\circ} 30'$, and $63^{\circ} 50'$ east of Paris. "From day-light to noon," says the extract from his journal, "the winds had made the round of the compass, with squalls, rain, thunder, and lightning; the sea very high, the air much heated." At ten o'clock in the morning he sees land very distinctly in the north-west. He immediately tacks to reconnoitre it, is satisfied of it at eleven o'clock, tacks about with the wind astern, runs towards the east, conceiving "that it might be the southern point of Madagascar," and on the 12th puts into Rodriguez, where he finds three leagues difference to the east, and supposes that this land, according to his reckoning, "is placed to the S. S. E. of Rodriguez, at a distance of one hundred and forty-two leagues." What confusion! How is it possible in this account of a ship tossed about in a storm to find a confirmation of the existence of Saint Juan de Lisboa? Vice-Admiral Thevenard, who appears to give credit to it,^b relies on Captain Donjon, lieutenant of a

ship not named, which is probably, however, that of Captain Sornin. According to this officer's journal, he saw land on the 27th of April, 1772, at half-past nine in the morning, "in a very violent storm, with much rain, thunder, and lightning," at a distance of from ten to twelve leagues in the west, in east longitude $76^{\circ} 34'$, and south latitude $27^{\circ} 26'$, observed at noon. He did not lose sight of the land from eleven o'clock till night, continuing the tack of east-south-east, and arrived on the twelfth day at Rodriguez, with forty-seven leagues difference to the east, which made him think that this land exists in that part of the sea between 76° and 80° of longitude, and in $27^{\circ} 30'$ of latitude. But in a private letter to M. d'Entrecasteaux, with an extract of his journal, and a view of the land, Captain Donjon, after having undoubtedly completed his observations in his closet, fixed the estimated longitude of his pretended discovery at $73^{\circ} 36'$, which he no longer hesitates to designate by the name of Saint Juan de Lisboa.^c

However frivolous and unsatisfactory these accounts are, the governing authorities of the Isle of France have nevertheless often ordered their official verification. The researches of M. de St. Felix, in 1773, and of M. Corval de Grenville, in 1782 and 1783, have been fruitless; but it would appear that they have not been sufficiently extended towards the east, within the space that separates Saint Paul from the Maldive Islands. M. Rochon adds, at the end of an extract from M. Sornin's journal, inserted in his voyages to the East Indies: "In returning from Madagascar, we thought at one time that we perceived the island of Saint Juan de Lisboa, but the illusion was caused by clouds, to which the most experienced mariners are too often exposed." Kerguelen and Marion have also searched for it in vain.^d Notwithstanding all these negative testimonies, many trading captains have recently maintained their having visited Juan de Lisboa.

This island then is a true haunting-spirit. It appears as a phantom to a certain select few, and disappears from the sight of the profane whenever they approach it.

A new hypothesis has been proposed by M. Collin: he believes that the name of Juan de Lisboa, in the ancient charts, merely designates the Isle of France.

Nevertheless, the secretary of the government of Mozambique has assured him that, among the papers deposited in the archives, exists the proces-verbal of the evacuation of the Portuguese colony of Juan de Lisboa; as well as an inventory of the effects transported from that island to the coast of Africa. All the efforts of M. Collin, to procure a sight of it, have proved fruitless. It is not known whether it was a permanent establishment, a post, or a mere attempt at settling. The year, and even the century, is unknown: moreover, neither the coast nor the island is known which at the time bore a name not considered by the Portuguese Teixeira worthy of being introduced into his chart. It appears certain that it could not have been the Isle of France, then well known to the Portuguese by the name of *Cerne*.^e

We conceive that the island of Juan de Lisboa is identical with that of Romeiros, and that it may, notwithstanding all doubts on the subject, really exist, but that it ought

^a Compare Book VII. vol. I. p. 60.

^d Collin, Mém. sur Juan de Lisboa, Annales des Voyages, t. X. p. 364.

^e Yet *Cerne* was rather applied to Madagascar. The old maps have both Mauritius and Bourbon without names. In 1598, Mauritius received its present name. Magin. Ptol. 25. Cluv. Geogr. p. 412. Rob. Nav. Intr. p. 27. and p. 145, above.

to be looked for in the meridians to the east of the isles of Saint Paul and Amsterdam, which, with Kerguelen's land, appear to us to indicate a submarine chain, either in the direction of Cape Comorin, or of Cape Leuwin.

The Islands of *Saint Paul* and *Saint Peter*, the last of which has also been called *Amsterdam*, have been objects of singular confusion. According to the navigator who first examined them with care, that of Amsterdam, or Saint Peter, is the most northern. It consists of a conical mountain, the summit of which appears to be the chimney of an extinct crater. A layer of turf three feet in height covers the pumice stone, or ancient lava. Thick groves render access to the interior very difficult; but the trees, not being able to push their roots far under ground, remain small. Lizards, and the trace of a fox, are supposed to have been seen. The Island of *Saint Paul*, the most southern, is in shape a circular mountain, hollowed in the centre in the form of a crater; the sea, in consequence of the falling in of one of its sides, has penetrated into this basin. The pond or lake filling up the bottom, contains an immense quantity of fish, particularly excellent perch. Hot and chalybeate springs flow among the lavas, interspersed with patches of fine green turf.^a This description, so satisfactory and so worthy of the ingenious observer to whom we are indebted for it, has been set aside by the presumptuous caprices of some modern navigators. Mr. Barrow, misled by the author of the charts of Cook's voyage, has described at length the island of Saint Paul, by the name of Amsterdam, and appears astonished at the pretended changes he thinks he has observed, and which he attributes to physical revolutions.^b M. Beautems Beaupré, in the atlas of D'Entrecasteaux, has gone farther: he has given six views of the pretended isle of Amsterdam, which is really only that of Saint Paul, proved by comparing the designs found in the work of Valentyn. At the moment that the French were passing the island, the volcano was emitting both flame and smoke; they were, however, able to ascertain the form of every part of it, not excepting the isolated rock, which, according to Barrow, is of basalt. M. Rossel, compiler of the voyage, discusses its geographical position with precision, without having perceived the confusion of names which is proved by the latitude in which he places the island.^c

Ten degrees farther south, *Kerguelen's Land*, called *Island of Desolation* by Captain Cook, presents its barren rocks, surrounded by masses of ice, and inhabited by seals. The almost total want of vegetation on this considerable island cannot be occasioned solely by rigour of climate; it is owing to its distance from any territory sufficiently extensive to develop within itself the power of vegetation. Many excellent harbours might render this station useful to enterprising whalers. More to the west, the *Marion Isles*, and those of *Prince Edward*, in like manner present only the frightful nakedness of a rock devoid of vegetation.

We have now terminated the description of the Eastern African Islands; for those marked in several charts under the names of *Dina* and *Marseveen*, do not exist. No account or description of these islands can be found. It is not known at what epoch, or by whom they were discovered; no one has seen them. In later times, they have

escaped the researches of Marion and Cook. It has been said, that the Dutch at the Cape are acquainted with them, and even go there in search of wood; but neither Valentyn, nor Mentzel, in their prolix accounts of the Cape, make mention of them. What motive could the Dutch have in concealing from Europe the situation of these two insignificant islands, since they have given the greatest publicity to all their other discoveries, far more important in themselves, and which might have indeed have excited the envy of powers jealous of their commerce? It is more natural to suppose, with M. Buache, that these isles have crept into our charts, like many others that for a long time occupied, and do still in part occupy, a place which sound criticism does not allow them.

In examining an ancient chart of *Nicolas Carnerio*, a Genoese, necessarily made a short time after the first voyages of Europeans to the Indies and America, this philosopher was struck with the name of *Dina Margabin*, applied to an island situated in the same tract of the ocean now assigned to the isles Dina and Marseveen.^d Carnerio's chart represents with sufficient minuteness and precision the western and southern coasts of Africa, as far as Meliada; but the rest is traced in an uncertain and slovenly manner. The island of Madagascar extends there from 30° to 40° of south latitude; the Comora Isles, which may be recognized by the names of *Jana* and *Calenzuan*, are found 18° to the east of the northern point of Madagascar. Three other islands, named *Dina Margabin*, *Dina Moraze*, and *Dina Arobi*, and placed to the east of the southern point of Madagascar, in the same latitude assigned to the two lost islands, can be no other than the Isles of Bourbon, Rodriguez, and France, or Mauritius. Without enumerating all the reasons militating in favour of this opinion, we shall merely observe here that *Dina Margabin*, the most western, the nearest to Madagascar and the largest, has a golden colouring that distinguishes it from the rest as the principal of the group. The name of *Margabin* is very analogous to the Arabic word *Mogrebin*, which signifies western; as for the word *dina*, joined to each of the three names, this can only be a generic name, very like, at least in the manuscripts, to the Arabic word *diva*, which signifies an island, and which is found in the names of Diu, Maldives, &c. Thus, *Dina Marseveen* is only one and the same name, corrupted and afterwards divided into two by superficial navigators or geographers, who perhaps knew the existence of several islands in the environs of Dina Margabin, forgetting at the same time that they were more generally designated by the name of the principal among them. The difference of their position in Carnerio's chart, from the real situation of the Mascarenha isles, proves nothing against their identity, since the great island of Madagascar has incontestably served to determine their position, particularly at a period when these seas were known only from the accounts of the Arabians, with whom the Portuguese communicated on the south-east coast of Africa. The would-be geographers or copiers of charts, on observing the Mascarenha isles more exactly marked, and called by other names, thought it right to retain or replace a little more to the west the names of Dina Margabin, Marseveen, or even Dina and Marseveen, in order that no void space might be left.

^c D'Entrecasteaux, Voyage, t. I. p. 44.

^d Buache, Mem. sur Dina et Marseveen, Mémoires de l'Institut, Sciences Morales et Politiques, t. IV. p. 367.

The *Ephemerides of Coimbra, of 1807*, place the island of *Denia* or *Dina*, in $40^{\circ} 32'$ South, and in $18^{\circ} 49' 7''$ East of Paris.

We have carefully endeavoured to discover if any thing were in opposition to the adoption of this ingenious hypothesis. One fact only has presented itself; it is the existence of a vessel belonging to Dutch India, bearing the precise name of *Marseveen*, during the very period that these

isles first began to appear upon the charts.^a This circumstance, however trifling it may appear, might render farther researches into the Dutch archives necessary, before admitting M. Buache's hypothesis. Even supposing, however, that the island of Marseveen exists, it is probably identical with Gough's, or Gonzalo-Alvarez island, situated much farther towards the west.

^a Valentyn, Oostindien, t. I. p. 236. List of Vessels.

BOOK LXXIV.

AFRICA.

Continuation of the Description of Africa.—The Western African Islands.

To the west of the Cape of Good Hope extends the southern Atlantic Ocean, which ought perhaps to be called the *African Ocean*, since the epithet *Ethiopian* gives a false idea of it. South America bounds it on the west; Cape Saint Roque and Cape Taguin on the north-west. The *Gulf of Guinea* forms its farthest projection to the north-east. Almost without islands, this part of the ocean is influenced very regularly by the trade-winds, and the general current, which cause both the air and waters to move towards the west. The trade wind, however, ceases to blow at one or two degrees north of the equator, where it is succeeded by west and south-west winds, which retain vessels in the Gulf of Guinea, to the great dread of navigators.

The first island to the west of the Cape of Good Hope is that of *Circumcision*, discovered in 1739 by Captain Bouvet, and again found by two English vessels in 1808. Since Captain Cook's fruitless search, it had been supposed that Captain Bouvet had only seen a mass of ice.^a Under a milder climate are found *Diego Alvarez* and *Gough's* islands, apparently the same as *Gonzalo Alvarez*. This last is 4380 feet high; fine cascades water a soil covered with green turf, where several shrubs grow among the rocks.^b The *Tristan d'Acunha* islands are better known; they are four in number. The principal island shows its round head^c at a distance, 8326 feet in height, clothed with verdure half way up, and covered with snow during many months of the year. Shrubs of the genus *Phyllica* shade the limpid streams with their thick foliage.^d An American has taken possession of these isles, and has successfully planted cotton and corn; he purposes forming an establishment for the refreshment of ships on their way to the Indies.

An immense aquatic solitude extends from these islands to that of Saint Helena. An imperceptible point in the Atlantic Ocean, this rock is nine leagues in its greatest circumference. Steep shores form for it a natural and nearly impregnable rampart. It is divided into two unequal parts by a chain of mountains intersected by deep valleys. Diana's Peak, at the eastern extremity of the great chain, is 2692 feet above the level of the sea. Basalt constitutes the base of the island; but a great quantity of lavas and scorïæ attest its volcanic nature. There is lime of excellent quality, stones that admit of a very fine polish, and

clays of different colours. Gold and copper were supposed to exist, as well as mines of iron, which the want of combustible matter will not prevent their working, if it be true that beds of pit-coal exist. The soil, generally rich and deep, contains many saline particles. The coast is very barren in appearance, but a rich verdure covers the interior of the island, even to the tops of the mountains, from which springs of wholesome and clear water exude on every side. The *sandy valley*^e is not the only picturesque scene that has employed the pencil of the artist. Besides about ten indigenous trees or shrubs, still imperfectly known, among which are three species of gum-trees, the finest flowers of Europe and Africa may be seen displaying their beautiful colours by the side of antiscorbutic plants, extolled by mariners. The cultivation of almost all the fruits and commodities of Europe and Asia succeeds here. The pasturage feeds a great many oxen, sheep and goats, a resource highly valued by navigators.

It has a population of about two thousand persons, of which five hundred are whites, and 1500 are negroes, the garrison not included. Jamestown, on the north-west coast, is the only town and port of Saint Helena. The approaches are defended by good fortifications. It being the ordinary place of refreshment for ships returning from India, it is changed once during the year, from an agreeable solitude to a noisy market place. At the time of its discovery in 1502, the interior was only one large forest, and the gum-tree even grew on the edges of the rocks suspended over the sea. Fernando Lopez, a Portuguese renegade, who in 1513 obtained the favour of living here, in exile, first stored it with goats, hogs, pintadoes, turkeys, partridges, pheasants, peacocks, and other species of birds; he planted roots, garden vegetables, and fruit-trees. The Portuguese having at last deserted it for their establishments on the south-east coast of Africa, it was taken possession of by the Dutch, and abandoned by them in 1651 for the Cape of Good Hope. The English afterwards established themselves here. From that time, until the period of their getting possession in their turn of the Cape of Good Hope, it was the only resting place possessed by the English East India Company for the refreshment of their ships in the Atlantic Ocean. At the present day, associated with the destinies of the earth, this small island, which, during life, was the prison, is still the sole repository of the ashes of him whose genius, but a little before, shook the foundations of the civilized world.^f

^f Brooke's Description of the island of St. Helena; London, 1802. French trans. by M. Cohen, with Notes by M. Malte-Brun. Forster, Valentia, &c.

Ascension Island, a rock without water, and nearly without vegetation, is an attraction to navigators from the immense quantity of turtles that come to repose on its shores, which are covered with lavas and volcanic scoriæ.

At the bottom of the Gulf of Guinea, a chain of islands appears to indicate the continuation of some chain of mountains of the neighbouring continent.

The island of *Fernando Po*, or more properly *Fernaõ do Po*, situated twelve leagues to the south of Baxasey Point, derives its name from a gentleman in the service of King Alphonso the Fifth of Portugal, who discovered it in 1472, and called it *Formosa*, or beautiful island. It is eight leagues long, from north-east to south-west, and about three wide. It is represented as very high, woody, frequently covered with clouds, very fertile in sugar-canes, cotton, tobacco, manioc, sweet potatoes, fruits, and other commodities bartered here for iron bars and wire. Portugal, after having previously abandoned it, ceded it in 1778 to Spain; its population is a mixture of mulattoes and negroes, who have not a very good character. Dalzel says, that the Spaniards have been driven by the natives from the fort they attempted to construct during the American war.^a It appears, however, that their colony is in a flourishing state, as Wadstrom relates that all the vessels of Camerones, Del-Rey, and Calabar, constantly find here an ample store of all kinds of provisions.^b The ordinary anchorage, where ships take in wood and water, is only an open road on the northern side.

Prince's Island, or *Ilha do Principe*, twenty-eight leagues distant to the S. S. W. of Fernando Po, is nearly eight leagues long, and six broad. It is the ordinary rendezvous of the Guineamen, the harbour being considered the best in this group of islands. The air is healthy and agreeable; the water excellent. Many fresh and clear streams descend to the coast; a small lake occupies the summit of a high mountain in the middle of the island. It abounds in wood, cocoa-nuts, oranges, lemons, figs, sweet potatoes, yams, rice, millet, maize, manioc, domestic animals, and poultry. The city, built near the north-east point, contains two hundred houses of one story, two churches, and a convent;^c there are about fifty whites, the remaining population consists of mulattoes and free negroes, who maintain a great many slaves. A small fort, guarded by Portuguese exiles, defends the entrance of the harbour.

At twenty leagues distance south-west of Prince's Island, under the equator, is the Island of Saint Thomas: it is twelve leagues in length, and seven in its greatest breadth, with fifteen thousand inhabitants, the greater part negroes or mulattoes.^d The northern part is composed of high mountains, terminating in peaks, always enveloped in clouds, which, at a distance, look like smoke, and have been taken by voyagers for perpetual snow. Moreover, the great and continual heat of the climate raises in the valleys thick and fetid fogs, that frequently envelope the whole island, and become, particularly during the months of December, January, and February, the cause of numerous diseases. In July and August, the south-east and south-west winds revive the debilitated habits of Euro-

peans, but they are very pernicious to the natives. Nevertheless, it is asserted that the people of colour, and the blacks, often live to the age of an hundred or more, while the white inhabitants scarcely attain fifty or sixty years.^e However it may be, the astonishing fertility of the soil makes them brave every inconvenience of the climate. The produce in raw sugar may be estimated at three millions of pounds weight in the year. The vine has been cultivated with success. Maize, millet, manioc, sweet potatoes, yams, cocoa-nuts, bananas, oranges, lemons, dates, and melons, abound in every part. Cassava is eaten instead of bread. The cinnamon tree has been recently discovered there.^f The flesh of the sheep and goats is excellent; but the oxen are smaller, and less fat than in Europe. Hogs are bred in considerable numbers, and fattened with the sugar cane, ground in mills. Poultry is very productive, and the rivers swarm with fish. Saint Thomas, or Panoasan,^g the capital, has 500 houses, principally of wood, three or four churches, and two convents; it is defended by a fort built upon a tongue of land. The road serves as a place of refreshment to vessels that have been prevented reaching Prince's Island, on account of contrary winds.^h All kinds of provisions can be procured for old clothes and old linen. The island of Saint Thomas is under the command of a mulatto governor; and its administration is conducted by a council of twelve natives. Every thing breathes pleasure and luxury. The slaves do not feel the effects of slavery, and scarcely work two or three days in the week. Black priests perform the duty of the churches or chapels dispersed about the island, in number eight or nine.ⁱ The greater number of them cannot even read; but they have each two or three concubines. Some white or mulatto capuchins, living in a small convent, are not more rigid in their conduct. Bishops have been sent at different periods by the court of Lisbon to re-establish religious discipline, but they generally died in a few days.

Among the islands in the vicinity of Saint Thomas, that of *Rolas* is about two leagues in length.

Annabona or *Bonanno* island,^k discovered by the Portuguese on the first day of the year 1473, has been ceded to Spain with that of Fernando-Po. It is about twenty-nine leagues south-west of the island of Rolas,^l and may be about seven or eight leagues in circumference.^m The land is high, the climate healthy, and it is intersected by pleasant valleys, bordered by mountains clothed with a rich verdure, and covered with mists not unfavourable to health. Delicious and very large oranges, cotton, tamarinds, pomegranates, and all the commodities of the three preceding islands, may be procured in return for salt and old clothes. The population is from eight to nine hundred inhabitants, who are the descendants of slaves thrown upon this island during a voyage to Brasil. Dalzel states, that at the moment of taking possession, the Spaniards were repulsed by the natives, already ill disposed towards the Portuguese. The only anchorage is on the northern side, and is very indifferent.

We shall not inquire concerning *Saint Matthew's* Island, the situation of which no modern navigator has been able

to find. It is probably that of Annabona, placed in a false longitude. The question, however, must remain undecided.

On leaving the Gulf of Guinea, and bearing up direct to the Cape-Verd Islands, along the meridians of these very islands, that part of the ocean must be traversed, so fatal to navigators, where long calms detain the ships under a sky charged with electric clouds, pouring down by turns torrents of rain and of fire. This *sea of thunder*, being a focus of mortal diseases, is avoided as much as possible, both in approaching the coasts of Africa, and in seeking those of America.

The archipelago of the *Cape-Verd Islands*, belonging to the Portuguese, comprehends ten islands, besides islets and rocks. The principal one is *San Iago*.^a At first sight the eye is offended by the appearance of barrenness; it looks as if it had just suffered from a great fire. Naked rocks, heaped in disorder one over the other, divided and rent by fantastic fractures, rise from the bottom of the sea, and extend themselves aloft to the clouds.^b On shore, the deplorable state of the inhabitants grieves the soul: their colour is so deep, that they hardly appear to have the least mixture of European blood circulating in their veins, even though they themselves boast of being Portuguese.^c The clergy is composed of men of colour, and even of negroes. The general misery arises, partly from the bad government, and partly from the droughts that sometimes visit the island during several successive years. The principal production is salt, the exclusive sale of which for Brasil is the profit of the government. Along the hillocks, and in the valleys, where the dew and moisture of the sea-air support vegetation, cocoa trees, banana trees, and papaws, covered with an eternal verdure, display their wholesome fruits. The tamarind and the *Adansonia*, afford a considerable shade. Nothing can equal the beauty of the oranges and lemons of the country. The guavas, figs, sweet potatoes, pumpkins, and water-melons, are of an excellent quality. The vine and sugar-cane prosper. Indigo and cotton plants, although left to themselves, thrive exceedingly. The silky down of the *asclepias*, which is seen flowering in every direction, serves to stuff pillows and mattresses. Rice and maize constitute the ordinary food of the people; but when the periodical rains fail, the soil, calcined by a devouring sun, resists the spade, and the poor are in danger of starving; for Fahrenheit's thermometer seldom descends below 80°, and often rises above 90°.

The mountains of the island are filled with goats and small bullocks. The peasants hunt Guinea fowls, wood pigeons, turtle doves, and other wild fowls. The only tolerable sea fish is a species of mullet; but the land-tortoises, that swarm in the valleys, furnish a delicious food. Good water for drinking is scarce. It would be wrong, however, to judge of the island from the state of the town of *Puerto Praya*, where navigators land. It consists of two rows of low rustic houses, intermixed with huts of a still more miserable appearance. A redoubt, fallen into ruins, affords a weak protection to the anchorage. But *San Iago*, the ancient capital, and *Ribeira Grande*, the residence of the authorities, have a better appearance, and even contain some tolerably large buildings.

The island of *Mayo*, rich in cattle and cotton, the island of *Fuego*, (or of Fire,) which, notwithstanding its very

active volcano, produces good fruits, and the island of *Brava*, or *Saint John*, which produces excellent wine and saltpetre, form a chain, with that of *San-Iago*, in a direction from east to west.

The island of *Bona-Vista*, (Bonne Vue) remarkable for a less elevated soil, very fertile in cotton and indigo, forms, with Salt Island, or *Ilha do Sal*, a line north and south.

The four remaining islands form part of a chain in a direction from S. E. to N. W., and succeed each other in the following order. *St. Nicholas*, one of the largest, and best governed of the whole archipelago, contains a town of the same name where very good cotton stuffs are manufactured. The soil of the island is hilly and fertile in fruits, but they only make a sour wine. *Santa Lucia*, high and wooded, has only brackish water. *San Vincente* is uninhabited, and like the former, abounds in wood and turtles. *San-Antonio*, the mountains of which are said to equal in height the Peak of Teneriffe, produces in its well-watered valleys, the indigo plant, the dragon tree, and orange and lemon trees.

In spite of the droughts to which these islands are subject, their natural produce in cotton, indigo, fruits, salt, goat skins, and turtle oil, might give them a considerable value under a more intelligent government. Their actual population is estimated at forty-two thousand souls.

To the north of the Cape Verd Islands, the waters of the ocean disappear under a thick bed of sea-weed, which, like a floating meadow, extends as far as the twenty-fifth parallel, and occupies a space of 60,000 square leagues; ships disengage themselves from it with difficulty. Other masses of sea-weed are also seen in parts of the sea more to the north-west, nearly under the meridian of *Cuervo*, and *Flores*, islands of the Azores, between the twenty-third and thirty-fifth northern parallels. The ancients were acquainted with these parts of the sea, which exhibited the appearance of meadows. "Some Phœnician ships," says Aristotle,^d "driven by an east wind, arrived, after thirty days sail, in a situation where the sea was covered with reeds and sea-weed." Some persons have conceived that this abundance of sea-weed, was a phenomenon proving the ancient existence of an Atlantis since swallowed up. It appears, that these facts were forgotten in the time of Christopher Columbus, for his companions were seized with terror on seeing this part of the sea, so abundant in plants, which the Portuguese called *Mar de Sargasso*.^e The sea, covered with sea-weed, in the environs of the Cape Verd Islands, is also described in the *Periplus of Scylax*.^f "The sea beyond Cerne is no longer navigable, on account of its shallowness, swamps, and sea-weed. The sea-weed is a cubit in thickness, and its superior extremity is pointed and sharp."

These passages of the ancients appear to demonstrate that their navigations terminated only at Cape Blanco, as we have already admitted, and not at Cape Boyador, as the learned M. Gosselin supposes. For the situation of the *Mar de Sargasso* could not have changed considerably, seeing that it depends on the winds and currents, eternal agents of immutable nature. At the most, the limits of these banks of marine plants may have formerly been a little less extensive.

The celebrated archipelago of the *Canary Islands*, con

ducts us towards the empire of civilization. It forms almost a part of Europe. What has not been written on the soft temperature of these islands, and on the pleasant landscapes contained within the compass of their rocky shores!

Lancerota commences the chain on the east. Stripped of its forests, it experiences, like the neighbouring continent, most destructive droughts; camels are, nevertheless, maintained in great numbers; and corn, barley, and pulse, are exported. The vine grows vigorously among the volcanic ashes.^a *Teguisa* is its capital. This island possesses the two best ports of the archipelago; it was called by the natives *Titeroygotou*, and was much more advanced in civilization than the islands situated more to the west. The inhabitants lived in houses built of free-stone, at the time when the Guanches of Teneriffe were lodged in caverns. Here was found the singular custom also existing in Tibet, which allows a woman to have several husbands.^b These traits of manners appear to lend additional weight to our opinion, according to which the islands of *Lancerota* and *Forteventura* were those only known by the ancient civilized world.

Forteventura, the indigenous name of which was *Erbania*, has nearly the same soil as *Lancerota*. The inhabitants are furnished with water almost entirely from cisterns. Nevertheless, in good years, they export both corn and barley. They also furnish barilla, cotton, and wine of a middling quality. *Betancuria*, the principal town, retains the name of the first modern conqueror of the Canaries.

The four islands of *Great Canary*, *Teneriffe*, *Gomera*, and *Palma*, compose a chain of very high mountains, in a direction from east to west. *Canary*, having a very fertile soil, watered by clear streams, and enjoying a moderate temperature, would be the most important of this archipelago if it had a better harbour, and if one hundred and fifty estates formed into *majorats* did not remain uncultivated.^c It produces maize, wheat, barley, wine, sugar much esteemed, olives, and silk. The city of *Las Palmas*, is the seat of the ecclesiastical authorities. The village of *Gualdar* consists of grottos, cut in the rocks by the ancient natives. On mount *Daremas*, the perfume of the groves, the murmuring of the waters, and the song of the canary birds, recal to the mind every thing written by the poets concerning the Fortunate Isles.

Teneriffe, the largest and most populous of these islands, had among the natives the name of *Chinerife*. The basaltic mountains of which its mass is formed, are in general six hundred toises above the level of the sea. The southern part includes the famous *Peak of Teyde*, or more accurately of *Echeyde*, that is, of Hell. It also bore among the Guanches the name of *Aya-Dyrma*; it is perhaps of all the volcanic mountains, that which has most occupied the attention of the moderns. Nevertheless, its elevation has only lately been determined with precision, which is nineteen hundred and four toises, or eleven thousand four hundred and twenty-four feet.^{d,e} Two thirds of the cone formed by this mountain, are covered with a fine

vegetation, in the middle of which few modern lavas are seen; one may traverse groves of bay trees, often surrounded by clouds. After having passed the region of clouds, the dry and desert soil begins to be covered with pumice stone, and obsidian or vitreous lava. This barren region occupies a space of ten square leagues of surface.^f A vast and deep reservoir contains water, which is frozen in the month of September. The volcanic cone, properly so called, has so steep a declivity, that it is only possible to mount it by following an ancient torrent of lava. The crater occasionally emits smoke, and the surrounding surface is in many places sufficiently heated to burn the shoes of travellers in walking. This volcano appears, however, to act more from the sides than summit: enormous lateral eruptions have attested, within twenty years, the continued violence of subterranean fire. Many appearances prove that there are considerable collections of water in the interior caverns of the Peak, which exhale in vapours through different spiracles; the two most remarkable bear the name of *narines*.

At the foot of this ignivomous mountain is expanded one of the finest countries of the world. The hills, cultivated in many places with as much attention as a garden, produce the most delicious fruits, and the highest flavoured wines. Teneriffe wine is of two kinds, Malmsey and *Yidonia*;^g twenty thousand pipes are made in abundant years.^h The flora of Teneriffe may give an idea of that of all the Canaries. The banana-tree, the papaw, and the magnificent *Poinciana*, adorn the gardens; the trichomanes of the Canaries, a handsome fern, covers the walls.ⁱ The cactus, cacalia, and euphorbia, recal to the mind by their stiff and pointed forms the vegetable aspect of Africa. The sugar of Teneriffe is from a cane^k peculiar to this archipelago. The orchil of this island is esteemed. Every traveller has admired a *Pterocarpus*, (*Sanguis draconis*,)^l of gigantic dimensions, which is preserved in a garden of the charming town of *Orotava*. "In June, 1799," says M. de Humboldt, "when we climbed the Peak of Teneriffe, we found that this enormous vegetable measured forty-five feet in circumference a little above the root."^m Sir G. Staunton asserts, that at the height of ten feet, it is twelve feet in diameter. Tradition reports that this dragon tree was revered by the Guanches, like the elm of Ephesus by the Greeks; and that in 1402, at the time of the first expedition of Betancour, it was as large and as hollow as at present. Considering that the dragon-tree, in every situation, is of slow growth, we may conclude that that of *Orotava* is extremely old. It appears, with reason, singular to M. Humboldt, that the dragon-tree has been cultivated from the earliest times in the Canary islands, as well as in those of Madeira and Porto-Santo, although it came originally from India. This fact appears to contradict the assertion of those who represent the Guanches as a race of men altogether isolated, and having had no connexion with the other people of Asia and Africa.

The towns of Teneriffe, the inns of navigators, have been twenty times described with more precision than most

European countries.^a *Santa Cruz*, the principal, containing 10,000 inhabitants, is the seat of government of the Canaries. *Laguna*, the ancient capital, boasts its delicious climate, and *Orotava* rivals the most beautiful situations in the world. In the botanic garden, established near this town, the plants of the old and new world internix their foliage.

Gomera, a small, very fertile, and well watered island, can almost maintain itself. The mountains of granite and micaceous schistus^b are covered with forests, and intersected by beautiful valleys, in which the laurel, the date, the lemon, the fig, the walnut, and mulberry flourish. Garden vegetables, pulse, corn, fruits, potatoes, yams, wine, honey, oxen and sheep, mules, poultry, and game, are found in abundance.^c

Saint Sebastian, the chief town, has a good port, where Christopher Columbus refitted his ships in 1492, before proceeding to the discovery of a new world. It has woollen manufactories and a sugar-work.

The soil of *Palma* is more elevated than that of Teneriffe, hilly, intersected by ravines, and filled with caverns: volcanic, and very barren in its southern part, it is generally fertile and populous only on its coasts, where it produces vegetables, good wine, a great deal of sugar, used principally in preserving fruits, in which the island abounds, and a great quantity of almonds. The produce in corn is not sufficient for the consumption of its inhabitants. In years of scarcity, the people live on the roots of fern, as at Gomera. According to Clavijo, there are neither deer, partridges, nor hares; but rabbits are very numerous, and destroy the trunks of young trees on the sides of the mountains: the regions of clouds only is richly wooded, and gives the island, seen at a distance, the appearance of a forest. A sort of aloes wood is found here.^d *Santa Cruz de las Palmas*, the capital, has a good port.

Hierro, or *Ferro*, the most western of the seven Canaries, has a volcanic soil, and little fertile. After having climbed a declivity of more than a league, that rises from the sea shore, we come to flowery fields, where numberless bees collect honey. *Valverde* is the chief town of this island. It has few springs; but the moisture of the soil is maintained by frequent fogs, which has induced the Canarians to surname it *Black Land*. Little corn is cultivated; much orchil is collected; and from 80 to 100,000 reals of brandy is made here annually, extracted from wine and figs.^e The pastures feed a great number of cattle, the flesh of which is very good, and the forests contain stags and roe-bucks. *The holy tree*,^f of Ferro Island, an object of so many fabulous tales, appears to have been a *Laurus indica*; it did not furnish the whole island with water, but the vapours condensed by its leaves afforded a considerable quantity, which, in times of drought, was a real resource. This tree, preserved with care, was destroyed in 1612 by a dreadful hurricane. Its existence, in vain called in question by the celebrated critic *Feyjoo*, has been juridically verified.^g

The observations, that would have rendered this topo-

graphy of the Canaries too dry, have been condensed in the following table.

Names of the islands.	Surface in marine square leagues. h	Population in 1797. i	Produce of wheat and sugar in arrobas. k
Teneriffe	73	81,000	89,556
Forteventura	63	12,000	150,000
Canary	60	58,000	70,453
Palma	27	25,000	44,350
Lancerota	26	13,000	155,461
Gomera	14	8,200	13,770
Ferro	7	5,700	7,000

270 sq. leagues. 202,900 inhab. 530,790 fan

The inhabitants of the Canaries, known by the name of *Islenos*, (the Islanders,) emigrate in great numbers to the coast of Caraccas, and to the Philippines. Quick and ingenious, like the Andalusians, they are fond of instruction, and labour like the Biscayans; they pronounce the Spanish language with a peculiar sweetness.¹ Philosophers, like Clavijo,—poets, such as Yriarte,—have adorned this people, who still reckon among them some estimable learned men, among whom good French books are very well known. The Canaries, the Cape, and the Isle of France, constitute in Africa almost the whole domain of civilization. The feudal rights, the majorats,^m and the great extent of uncultivated domain lands, arrest the progress of cultivation and the public prosperity in the Canaries.

What has become of the *Guanches*, whose mummies alone, buried in caverns, have escaped destruction? In the 15th century, some commercial nations, especially the Spaniards and Portuguese, went in search of slaves to the Canary Islands, as they afterwards did to the coast of Guinea. Under the Guanches, the Archipelago of the Canaries was divided into several small states, hostile to each other, and the cupidity of Europeans kept up their intestine wars, for the sake of purchasing the prisoners; many of them preferred death to slavery, and killed themselves and their children. It is in this manner that the population of the Canaries had suffered considerably by the commerce of slaves, by the rapine of pirates, and particularly by a continued slaughter, at the time that Alonzo de Lugo completed the conquest of them. Such of the Guanches as remained, perished in 1494, in the famous plague called *modorra*, which was attributed to the number of dead bodies left by the Spaniards exposed to the air after the battle of Laguna. This fine nation of Guanches was almost extinct at the commencement of the seventeenth century; a few old men only were found at Candelaria and Guimar. At this time, there does not exist throughout the Archipelago one native of the *pure race*. Some Canarian families boast of their relationship to the last shepherd king of Guimar; but these pretensions do not rest on very solid foundations; they are occasionally renewed whenever a man more tawny than his neighbours is anxious to solicit the rank of officer in the service of the king of Spain.ⁿ

The Guanches, celebrated for their tall figure, and often conspicuous for fine fair hair, have furnished excellent subjects for the pen of historians discontented with the age; and a short time after the discovery of America, they were fond

of celebrating the generous virtues of the Guanches, as they have in our time extolled the innocent mildness of the islanders of Otaheite, or as Tactius has traced his seducing account of the Germans. In fact, if the Guanches offer some physical analogy with the colossal arborigines of ancient Germany, they appear to have resembled, in other respects, the Otaheitians. We see them both oppressed by the yoke of a feudal government. Among the Guanches, this institution, which facilitates and perpetuates wars, was sanctioned by religion. The priests said to the people—"The great spirit, *Achamas*, first created the nobles, the *Achimeceys*,^a to whom he gave all the goats existing in the world. He afterwards created the common people, the *Achicurnas*; this younger race had the insolence also to demand goats, but the Supreme Being answered that the people were designed to serve the nobles, and that they had no occasion for any property." The *faycas*, or great priest, exercised the right of ennobling; and a law provided, that every Achimece who should disgrace himself by milking a goat with his own hands, should lose his titles of nobility. This law does not savour much of the simplicity of manners of the Homeric age.

The mummies of this nation, seen in the cabinets of Europe, are brought from sepulchral caverns cut in the rock on the eastern declivity of the Peak of Teneriffe. The ancient Guanches, after having deposited in these catacombs a sufficient number of bodies, took the precaution of shutting the entrance; and it is asserted that the knowledge of these burial places was a secret transmitted exclusively to certain families.^b These mummies, at present very rare in the Canaries themselves, are in so extraordinary a state of dryness, that the entire body, covered with its integuments, often does not weigh more than six or seven pounds, that is, a third less than the skeleton of an individual of the same size, recently cleared of its muscles. The cranium, in its form, has some resemblance to that of the white race of the ancient Egyptians: and the incisor teeth are blunted among the Guanches, as in the mummies found on the borders of the Nile. But this form of teeth is due to art alone; and, on a careful examination of the physiognomy of the ancient Canarians, skilful anatomists^c have observed in the zygomatic bones, and in the lower jaw, very sensible differences from the Egyptian mummies. On opening those of the Guanches, remains of aromatic plants are found, among which is constantly observed the *Chenopodium ambrosioides*: the bodies are often ornamented with fillets, to which are suspended small disks of baked earth, that appear to have been used as numerical signs, and resemble the *quippos* of the Peruvians, Mexicans, and Chinese.^d

The sole remains likely to throw some light on the origin of the Guanches, is their language; but unfortunately, not more than one hundred and fifty words remain, many of which express the same objects, according to the dialect of different islands. Besides these words, many precious

fragments exist in the denomination of a great number of hamlets, hills, and valleys.

It was long thought that the language of the Guanches did not present any analogy with the living languages; but since the travels of Hornemann; and the ingenious researches of MM. Marsden and Venture, have fixed the attention of learned men on the *Berbers* or *Shillooks*, who occupy an immense tract of land in Northern Africa, many Guanche words have been discovered, having roots in common with the *shilla* and *gebali* dialects.^e

If this analogy does not prove a common origin, it at least points out some ancient connexion between the Guanches and the Berbers, in whom they find restored the Numidians, Getulians, and Garamantes.

To the west of the Canary Islands, a tradition much propagated, but very obscure, places an island called *Saint Brandon*, or *Saint Borondon*. It is even pretended that it was visible from the shores of the island of Palma. A holy bishop had conducted thither a colony of Christians, at the time of the irruption of the Moors into Spain. These traditions may be the consequence of those optical illusions, by which the image of a real coast is repeated in the clouds. Perhaps also some sub-marine volcano, existing to the west of the Canaries, alternately causes the sides of its crater to appear and disappear.

Passing by the group of rocks called the *Salvages*, or *Savage Isles*, we arrive, after a sail of eighty marine leagues, at the Island of Madeira, which, with that of Porto-Santo, and some other desert islets, forms a distinct group. The Portuguese, who are masters of it, not long since gave to England the right of garrisoning it.^f

The soil of Madeira is mountainous, and rises on every side towards a chain of mountains, the summit of which is called *Pico Ruivo*, 5068 feet in height. On the summit is a cavity, called by the inhabitants *Val*, which appears to be the mouth of an ancient crater; and this is an idea confirmed by the lavas, for the most part light and of a bluish colour, dispersed in various directions, broken pieces of which the sea occasionally carries into the southern bay: but no pumice-stone is found; and there is no other trace in the island of any thing volcanic.^g It is, however, frequently subject to earthquakes. The constituent parts of the mountains are principally quartz and granular schistus; the fissures contain iron and ochre. M. Rathke, a Danish naturalist, brought from this island some native lead, enclosed in a soft lava. The coast is generally steep and difficult of access; the waves dash against it with violence.

The climate is soft, temperate, and very agreeable; there is an almost perpetual spring. During the cold season the thermometer is generally from 65° to 60° of Fahrenheit;^h it seldom falls to 55°. During summer it is generally between 66° and 76°. The hot winds blowing from the coast of Africa generally raise it from 90° to 95°. This high degree of heat soon gives way, and is succeeded by

^a Or Achamanacres. This word recalls to our memory the family of the Achemenides in Persia, and the Atamans, or chiefs of the Tartar hordes.

^f In 1801 and 1807.

^g According to the statements of the Hon. H. G. Bennet, the structure of the island is wholly volcanic. No sulphur, however, has been found. The rocks consist of four kinds of lavas, three of which invariably alternate with each other from below upwards, viz.: blue fine grained; compact; red earthy, friable; grayish, compact or cellular. The two latter are sometimes prismatic, particularly the grayish kind. The fourth kind forms a stratum by itself, brownish red, coarse grained, friable. There are also beds of ashes, pumice, and puzzolana.—P.

^h Comp. A. Humboldt's Isothermal table.

storms. The north-east wind prevails in the interior of the island. On the southern coast, there is a soft breeze from the east in the morning, during nine months of the year, which shifts to the west towards noon. In the evening and during the night it is succeeded by a land wind or by calms. The autumnal equinox brings with it strong southerly winds, which afterwards alternate till the end of the year with west winds, often stormy. The rains that fall between the month of November and the end of February are neither violent nor considerable; in the course of seven years, there were 462 rainy days.^a The natural moisture of the earth is maintained by the snow, which covers the highest mountains during a considerable part of the year, and by the clouds that envelope the tops during the day, and descend into the valleys at sun-set, disappearing again at day-break.

The island abounds in springs, and is watered by several small rivers descending from the mountains, and often forming in the ravines very picturesque cascades: water is conveyed from them over the stony soil of the gardens and vineyards, by means of dikes and ditches, under the inspection of particular officers.

The abundance of wood with which it was formerly covered gave it the name of *Madeira* (timber.) To facilitate its extirpation, it was set on fire, and continued to burn during a period of seven years. At the present time, the gardens and orchards display a great variety of fruit trees, European as well as tropical. But the forests, consisting chiefly of chesnut and walnut trees, are only found on the higher declivities of the mountains. The cedar, cypress, ironwood, and several species of laurel, are found here; among the latter may be enumerated the *Laurus indica*, affording the mahogany of Madeira. Higher up pines grow; but the highest points present only stunted shrubs and bramble bushes, that supply the want of wood for fuel. The fields are covered with broom, cytissus, myrtles, Indian figs, euphorbias, raspberry bushes, rose bushes, jasmins, water lemons,^b mock privets, and dragon-trees.^c

The sugar of Madeira was formerly much esteemed for its violet odour and aromatic flavour; at the present period, they prepare only a small quantity of molasses and syrup. The cultivation of the sugar-cane has given way altogether to that of the vine, which in fact constitutes the wealth of the island. The vineyards, for the watering of which much industry has been used, rise on the southern sides of the mountains, to the height of nearly two leagues. The grapes ripen in the shade of the vines, and are gathered when half dried. The precious Malmsey wine is produced from plants brought originally from Candia. According to Staunton, five hundred pipes are made annually. The other and most abundant kind, is known by the name of dry Madeira.^d The produce varies annually from fifteen to twenty-five thousand pipes; the exportation amounts to twelve or fifteen thousand. Five thousand five hundred are sent to England, five thousand five hundred to the East Indies, three thousand to the West Indies, and two thousand to the United States of America, where wine of an inferior quality is purchased.^e They have lately began to culti-

vate the olive tree, by order of government. The corn of the island, particularly wheat and barley, is excellent; it is a produce, however, only sufficient for four months consumption. Onions, gourds, Egyptian arum, yams, and chestnuts, are the principal articles of food. The gray canary-bird is indigenous. The bees of the valleys afford an excellent honey. In the sea are found trout; albacores, a species of tunny; and an abundance of other fish. Nevertheless, during lent, and meagre days, these islanders make use of cod imported in foreign vessels.

Madeira contained, in 1767, a population of sixty-four thousand souls. The church registers exhibit, during a period of eight years, an annual increase of nine hundred and seven persons, and state the proportion of deaths only at one in forty-nine.^f In our time, Staunton has estimated its total population at eighty thousand; and Barrow at ninety thousand. It is composed of a mixture of Portuguese, mulattoes, and negroes. The creoles are tawny, small in stature, dirty, and badly clothed. The people in general lead a miserable life, and strangers drink the greater part of the wine made in the island. The women, possessed of many natural advantages, are overwhelmed with toil and fatigue, as the law prohibits the employment of negro slaves in the labours of the field. Among the middling classes, morals are not very pure. The better class of people pass their indolent lives in country houses, or *quintas*, the gardens of which possess nothing attractive; they each contain a chapel; and the service is performed by a private chaplain. The only persons of real wealth are the English merchants and Irish catholics settled in the capital. The land of the island belongs, as manorial property, to the descendants of Captains Tristan Vaz, and Joaõ Gonsalves, to whom the king of Portugal gave the sovereignty, as a reward for their services. It is divided politically into two governments.^g That of Funchal, the most fertile and populous, includes the capital of the same name, a town most agreeably situated on the southern coast, at the foot of high mountains, and defended by many forts. It contains two thousand houses, and more than twelve thousand inhabitants.^h In the church of the Franciscans, there is a chapel with its window sashes of massive silver; while the walls of another are covered with human skulls, which also constitute all the ornaments of the altar. The road-stead is not tenable in winter. The government of *Machico*, formerly fertile in sugar, and which still produces the best Malmsey wine, contains a town of the same name situated on the eastern coast, and having a bad open roadstead.

The revenues of the island are not known with certainty. M. Lundy estimates the produce of the customs alone at 320,000 crusades,ⁱ and, in favourable years, at 400,000. To this must be added the tithe, and the monopoly of tobacco.

The island of *Porto Santo*, situated to the north-east of Madeira, was given, in 1446, to Bartholomeo Serestrello, who first colonized it. It consists only of a steep mountain, often enveloped in clouds, surrounded with a strip of low land, and containing about twelve hundred inhabitants.^k The soil is tolerably fertile, and produces good wine,

oranges, barley, rye, and wheat. There are also many rabbits and goats, partridges, pigeons, and wild turtle-doves, bees affording a good honey, oxen, sheep, hogs, and even some horses and mules. The small town of the same name on the southern coast, has a very good anchorage.

Sailing westward two hundred and twenty leagues we arrive at the archipelago of the Azores, so called from the great numbers of goshawks (in Portuguese *Azor*) found on them at their first discovery. They are also called *Terceiras*, after the largest among them, or Flemish Islands, *Flamengas*, after the Flemish navigators who came here almost at the same time as the Portuguese, and who in part peopled them. The English sometimes designate them by the name of Western Islands.

They are situated in a line from south-east to north-west, and form three groupes. The southern, and nearest to the route pursued by vessels coming from Europe, consists of the islands of *Saint Mary* and *Saint Michael*. The middle group comprehends *Terceira*, *Saint George*, *Graciosa*, *Fayal*, and *Pico*; to the north are *Flores* and *Corvo*. The air is healthy, the climate agreeable, and milder than in the countries of Europe situated in the same latitude. The heat of summer is tempered by the sea breezes, and the winter is characterized only by cloudy weather, by rains, and by winds that sometimes blow with the force of a hurricane. The cold is never so great as to render it necessary to warm the apartments. Snow and ice appear very seldom on the tops of the highest mountains. Earthquakes are the only scourges of these fortunate islands, whose volcanic nature is attested by the form of the mountains, by craters, rents in their sides, numerous caverns, lavas, pumice stone, and cinders collected in every part. The coasts are generally high and steep; the soil has little depth, but is very fertile, and well watered by fresh and clear streams. Its produce and exports consist of flax, wheat, barley, maize, millet, pulse, olives, oranges, lemons, and much good wine, which often passes for Madeira. Some time ago the produce was estimated at 34,100 pipes;^a it must have increased in consequence of the demand for it in England. Woad formerly constituted an important branch of commerce; the sugar cane was also cultivated. Among a great variety of trees, we may notice the banana, and particularly the cedar tree, which constitutes the finest ornament of the forests. The hills are covered with a perpetual verdure. There are very large oxen, many hogs and sheep, good mules, and asses.

The sea affords a rich repast of delicate fish, small turtles, and many shell-fish, among which are two kinds of excellent oysters, called *Lapas* and *cracas*. The whale-fishery, now neglected, was formerly very lucrative.

The excellent climate of the Azores is so favourable to population, that they have been able to furnish Brazil, and even the province of Alentejo, in Portugal, with inhabitants. Raynal estimates the number of inhabitants at 142,000; but, according to a more recent account, published in 1789, it was as high as 150,174.^b *Saint Michael*, *Fayal*, and *Graciosa*, are the most populous. The inhabitants are white, with the exception of a small number of negroes employed as servants. The nobility are nu-

merous, and possess a considerable part of the land. The inhabitants are industrious, sober, and healthy, but are unprovided with the means of education. In productive years, the Azores can fit out for Brazil, Portugal, England, and other northern countries, fifty vessels laden with corn, fruit, honey, pulse, flour, salted meats, bacon, orchil, coarse linen, brandy, wine, vinegar, &c.; the absolute want, however, of a spacious, safe, and deep port, will ever prevent the commerce of these islands from acquiring any great extent.

The governor, captain-general of the nine islands, resides at Angra: he is appointed, in the first place, for the term of three years, but may be continued.

The administration of each island is under the control of one or two captain-majors,^c who attend to the maintenance of the police, command the militia, and inspect the receipt of the taxes. The two forts at Angra have separate commandants; in other respects, the islands are in a bad state of defence.

The churches are not highly endowed, and convents, particularly those of nuns, are few in number.

Saint Michael, or *San Miguel*, the nearest to Portugal, has a surface of 15,018 geographical square miles. In 1790^d its population amounted to 62,214 persons; of which number, 27,234 were males, 33,624 females, and 1256 were ecclesiastics or religious persons^e of both sexes.

The eastern and western coasts are bordered by high mountains. Towards the middle, the heights are less elevated and of a conical form. Traces of volcanic eruptions are every where observed; the last took place in 1652. The craters seen on the greater number of the mountains, particularly towards the west, are now converted into lakes. Naturalists admire, among others, in the eastern part of the island, a deep and very romantic valley, called *Furnas*,^f which appears to have been formed by the sinking of a volcano. Its form is oval, and rather more than a geographical mile in circumference. High mountains, steep and covered with cedars, point out its extent. One part of this valley presents the appearance of a terrestrial paradise, while the other and deeper part is almost entirely filled with pumice stones reduced to powder. The hollow is occupied by a tolerably large lake of fresh water, and by many springs of mineral and sulphureous waters, both warm and cold. They give rise to the *Ribeira Quente*, a small river, whose smoking waters open a passage for themselves through the clefts of rocks, and towards the south-east empty themselves into the sea, where, in some places, at a considerable distance from the shore, the water may be seen to bubble with violence.

The island is in general well watered, and very fertile, but indifferently cultivated. They do not derive all the profit which they might from its mineral productions, such as sulphur, native sal-ammoniac, marl, red oxide of iron, vitriolic earth, and pumice stone. The Dutch, long ago, exported fuller's earth;^g and, in the sixteenth century, there was in the vale of *Furnas* a manufactory of alum that furnished 4833 quintals in the space of ten years. Vegetation is in the highest state of beauty, and numerous groves diversify the landscape; the fields produce, at little expense, excellent wheat, maize, a little barley, beans, and

rice in large quantity. In the gardens are raised very fine oranges and many other fruits. The vines, planted principally upon decomposed lava, produce annually 5000 pipes of wine. The pastures are good and abundant. The vale of Furnas furnishes excellent honey; the shore, sponges, which they do not attend to; and the sea abounds in pilchards, the food of the lower classes.

The inhabitants manufacture coarse linens, to send to Brazil.

Punta Delgada, the capital of the island, with a population of 12,000 inhabitants, carries on a considerable trade in the productions of the country, both with Europe and America. It has, nevertheless, a bad roadstead, defended by the fort of Saint Braz. *Ribeira Grande*, a town with 6000 inhabitants, has many looms for cloths.^a

A phenomenon of great interest ought still to detain us some moments in these seas: it is the consideration of one of those volcanic islands, the summit of which is at one time above the waters, and at another considerably below the surface. The sea of the Azores probably contains more than one volcanic mountain, similar to those that, in the islands, raise themselves above the surface of the waters.

Without attending to a very obscure Portuguese tradition, according to which the whole island of Corvo arose from the sea by a volcanic eruption, we shall here mention that, during the great earthquake of 1757, which laid waste the island of Saint George, and destroyed 1500 persons, or a seventh of its population, eighteen small islands, according to several authentic testimonies, although not circumstantially detailed, were seen to rise from the sea, at a distance of 200 yards from the shore.^b

But the only sub-marine volcano, satisfactorily observed, is that near the island of St. Michael. It was during a violent earthquake in 1638 that flames and puffs of smoke were seen to rise from the agitated sea. According to the report of the fishermen, this vast fire was extended over a space of several acres; earthy matters and masses of rock were seen tossed into the air, and falling again into the sea, upon which they floated; other rocks of a blackish colour seemed to rise from the waters; some of them were raised to a height of sixty fathoms: by degrees all these masses were united, covering a space of three leagues in length, and half a league in breadth. These eruptions continued during three weeks: all these rocks, raised above the sea, are then said to have disappeared without a trace being left.^c The fishermen, witnesses of this catastrophe, took fragments of the rocks ejected from the sea; they burst into fragments, and left nothing but a blackish gravel: these then were scoræ and volcanic tuff. The crater of the volcano had afforded shelter to great numbers of fish: It was the ordinary rendezvous of the fishermen of the island; and, at the time of the eruption, the sea ejected so many dead fish that the air became infected by them.

We must here notice a circumstance, of little importance in itself, but which, in its consequences, may become of the greatest interest for natural history and physical geography. The authorities we have already quoted, agree in fixing the period of this memorable eruption in the year

1638. Nevertheless, Buffon affirms that this occurrence took place in 1628; he relies on the authority of Mandelslo, a famous navigator: yet, in looking into the original German edition of Mandelslo's account, published by Olearius in 1658, nothing is to be found on the subject of this eruption: it is the same in the Dutch translation. The passage quoted and transcribed by Buffon is only to be found in the French translation by Wiquefort, (Paris, 1678,) and in the English one, in Harris's collection, (London, 1705;) it was natural to reject an opinion so feebly supported: but if, nevertheless, by a chance not without example, this opinion should be found confirmed by some new testimony; if Gassendi and Kircher were deceived in substituting 1638 for 1628, the three known eruptions of this volcano, namely, that of which we have been treating, and those of 1720 and 1811, would be found at a distance from each other of from ninety-one to ninety-two years; which will allow of our considering this volcano as being subject to a *regular period*. So curious a result merits a farther examination of the true date of the eruption of the seventeenth century.

Whatever may be the real nature of this chronological question, the date of the eruptions of 1720 is well established. It was in the month of November of that year, that, after a violent earthquake, an island resembling a conical mountain was observed to rise between the islands of St. Michael and Terceira; it emitted flames, ashes, and pumice stones; a torrent of burning lava ran down its steep sides; it became as large as a marine league in circumference, and was visible at a distance of eight or ten leagues. It soon, however, began to sink, and in the month of November, 1723, had disappeared altogether. The soundings gave eighty fathoms in the very spot where it had appeared. Many detailed, unanimous, and authentic accounts, are given respecting the emersion of this island; the appearance on the spot has even been drawn;^d so that it is difficult to raise any doubt of the reality of the occurrence. This, however, has been attempted by a learned Spanish hydrographer: he maintains that this pretended island was nothing but a collection of scoria and pumice stones, thrown out that same year from the Peak of the Azores, the Peak of Camarinhas, (in the island of Saint Michael,) and other volcanoes of this archipelago, carried along and united by the marine currents.^e But the height of the island, and the appearance drawn, sufficiently refute these ideas. It will only remain to examine whether this island existed in the same situation with that of 1628 or 1638: there are accounts that place it much farther in the sea.

The same uncertainty prevails respecting the volcanic island that rose in these seas in the month of July, 1811. The reports of navigators, who were eye-witnesses, forcibly describe the terrors produced in them by this physical revolution:—the sea boiling, a column of fire, smoke, and ashes thrown up into the air; the destruction of a part of the island of St. Michael; dead fish; and the waves covered with pumice stones. But the volcanic island appeared to the *south-east* of the great island, which does not appear to agree with the position of the volcanic island of 1720. An English captain, who was present at the rise of this island, assigns to it three miles of circumference,—

he gave it the name of *Sabrina*, and took possession of it as an *English discovery*; the sea, however, has already swallowed up this new British possession.

Saint Mary, (*Santa Maria*,) the farthest to the south-east of all, and one of the smallest, contains only 12,000 inhabitants. The land, very high towards the east, descends a little towards the west. Marble is extracted, and an argillaceous earth that makes very fine pottery. It also possesses a species of Guinea sea-bird, called *garajaó*. Wheat, wine, cattle, lime, and pottery, are exported. *Villa de Santa Maria* is the capital. To the north-east of this island, at a distance of five miles, are found the *Formigas*, a group of uninhabited islets and rocks, that may probably belong to the summit of a sub-marine volcano.

The coast of *Terceira* is in general high, and in part inaccessible. Although the soil does not appear to be volcanic, it has nevertheless been recently subject to earthquakes. A very formidable volcano even was formed in 1761.^a The vegetable soil is deeper than in the other Azores, and extremely fertile. It contains some forests of cedars, chesnut and mulberry trees, and orchards of fine lemon, orange, and apple trees. The wine of the country is indifferent, but the fields are well cultivated, and produce a considerable quantity of wheat for exportation. The feeding of cattle, favoured by excellent pastures, is more extensive than in the other Azores: the cheese also, and hams, of *Terceira*, are in repute. The sea abounds in anchovies, goldneys, graylings, perch, barbel, and other more rare fish. The fishing is facilitated by the shallows near the shore.

The population amounts to 28,900 persons. Industrious and sober, the inhabitants of *Terceira* still retain an ancient reputation for courage, which they have merited, by maintaining to the last extremity the independence of the Portuguese name against Spanish usurpation, and by shaking off this odious yoke as soon as the elevation of the house of Braganza was known to them.^b

Angra, the capital, contains more than a third of the population. It is the seat of the ecclesiastical, civil, and military authorities of the whole archipelago. The inhabitants export in their own vessels, corn, flax, linen, and wine. Angra is also the common resort of Portuguese vessels going to Brazil and the Indies.

The island of *Saint George*, or *São Jorge*, between the islands of *Graciosa* and *Pico*, is high without being mountainous. In the south, there are vineyards, the produce of which is preferred to the other wines of the Azores,^c and excellent pastures. Besides the advantages enjoyed by the other Azores, it possesses an abundance of wood, even timber for building, and the best water. Its population exceeds 11,000 souls.

Graciosa, one of the smallest, is situated north-west of *Terceira*. The enchanting appearance of its three mountains, seen from the south-west, the great fertility of its soil, and the very peculiar salubrity of its climate, have procured for it the fine name it bears. It produces corn, pulse, pot-herbs, fruits, wine, brandy, butter, and cheese; but it is without fire-wood. Its population is 7315 souls.

Fayal, the most western of the central group, has more than 16,000 inhabitants. Lofty and steep rocks border the coast in almost every direction. The soil, undulating and covered with a rich verdure, rises towards the middle of the island, where the mountains, ranged in a circle, surround a deep valley a league in breadth. It is called *a Caldeira*, or the Caldron, and is believed, with some degree of probability, to owe its origin to the sinking of a volcano. A third of its extent is occupied by a lake, in which are united the springs of many running waters. The beautiful meadows and delightful groves that deck the borders of this lake, and extend along the gentle declivity of the hills, vary the prospect, and form an enchanting residence.

The climate of the island is in general delightful and very healthy; the soil is so fertile as frequently to yield two harvests of wheat and maize. In the gardens and orchards, the potato, recently introduced, grows by the side of lemon and orange trees: but there are few vineyards, and their produce is of indifferent quality. The wines, known in commerce by the name of *Fayal*, are brought here from *Pico*.^d Tufts of ash, of tall beech,^e and chesnut trees crown the heights; but myrtle bushes, and other evergreen shrubs, generally predominate.

The inhabitants are remarkable for the goodness and mildness of their character, the simplicity of their manners, and honesty in their dealings.

Villa da Orta, the capital of the island, sometimes called by mistake *Fayal*, has a population of 4000 persons. It is only a large village, built in the form of an amphitheatre, on a spacious bay, affording tolerably good anchorage. Around the bay, forests of lemon and orange-trees cover the sides of the hills as far as the eye can reach. It is the market for all the productions of *Fayal* and *Pico* islands, and the centre of a considerable commerce. There are French, English, Spanish, and American consuls.

Pico, very close to *Fayal*, is the largest of the Azores, after *Saint-Michael*; but it has a population of only 21,000. The western part presents only an assemblage of mountains surmounted by the *Pico*, an ancient volcano, from which the island takes its name, and which rises near the coast to a height of 1250 toises:^f in clear weather it may be seen at sea at a distance of thirty-four marine leagues. At its summit, generally enveloped in clouds, or covered with snow, is found a crater that constantly emits smoke.^g Lower down, large caverns are found, from the roofs of which much water drops. Verdure begins to appear: by degrees forests succeed to bramble-bushes; and pastures of aromatic plants allure the cattle. At last, the lower elevations, where the inhabitants have covered the stones and lava with earth, partly bought at *Fayal*, and transported with great pains to these heights, prove what labour and human perseverance can accomplish, even in a contest with nature. Excellent vineyards, sheltered by walls against the winds from the sea, here occupy a great extent of land.

The eastern part of the island is low, level, and fertile: nevertheless it is with difficulty that a sufficient quantity of corn is raised to supply half its inhabitants; and the poor

derive the principal part of their subsistence from yams, that are in great abundance. All the fruits, likewise, of the south of Europe, grow abundantly, and of excellent quality. Wine, however, constitutes the greatest riches of the island. It produces, according to the season, from 15 to 30,000 pipes. There are two principal kinds,—the malmsey (*vino passado*) is equal to Madeira wine, of which, however, a small quantity only is made; the other, (*vino seco*,) varies much in its goodness. The vintage time is in the beginning of September, a period of holidays and continual mirth, that brings thither a third of the population of Fayal. The wines of Pico are carried principally to Brazil, the United States, and England; a part also to Holland, to the North, and to Angola. The forests, principally consisting of cedars, produce also many yew trees, the wood of which is in much request for cabinet-work, and was formerly a monopoly of the crown. The inhabitants of Pico are famous for the beauty of their forms, their vivacity, and their fondness for industry and cleanliness. They are principally like those of Fayal, descendants of the Flemish colonies conducted by Jobst de Hurter,^a father-in-law of the celebrated geographer Martin Behaim.^b

The island of Flores, situated north-west of Fayal, is steep along the coast, mountainous in the interior, covered with a thin bed of earth, and well watered by clear streams, that form several fine cascades. Exempt from earthquakes, it is, nevertheless, subject to violent winds, that often destroy the hopes of the husbandman. Forests of large cedars embellish the mountains; the plains produce wheat, rye, yams, and *yuncas*, a tuberous root, the flour of which, mixed with that of rye, makes a good bread; the rocks of the coast are covered with orchil, which is not gathered without danger. The vine is not cultivated, and maize does not succeed. The breeding of sheep and fowls occupies much attention. More than three thousand inha-

bitants are partly employed in the manufacturing of woollen stuffs.

Corvo, the smallest of the Azores, as well as the most northern, is sometimes included with the preceding island under the general name of *Os Corvos*. Colder than Flores, it abounds in excellent wheat, pulse, yams, flax, cattle, and cedar wood. Its population amounts only to seven or eight hundred individuals, who have every thing in common. In this way they share with each other the milk of their herds, the wood that they are allowed to cut, and the wool of their flocks, of which they make coarse stuffs. There are some anchorages along the coast, and at the northern and southern extremity of the island are two mountains, one of which encloses, in a hollow on its summit, a lake of fresh water. It has been asserted, without proof, and even without probability, that the island owes its origin to a submarine volcano.

We shall not conclude this description of the Azores, collected from pure and authentic sources, without acquainting our readers that we have discussed in another part of this summary,^c several questions relative to the history of the discovery of these islands; we have adopted the opinion that they had been visited at least a century before the Portuguese imagined they had discovered them. Not only do the descriptions of the Arabian geographers clearly point out other islands besides the Canaries,^d but the Azores appear on manuscript charts even of the fourteenth century. The name of one of them, *Bentufla*, had appeared to us to be Arabian, and we had considered the Moors of Spain as the first authors of the discovery. Benincosa's chart of 1476 appears however to prove that the name *Bentufla* is only an Arabic corruption of the Spanish or Italian word *Ventura*; a circumstance that assigns to Europeans the honour of the first discovery.^e No new light has appeared to guide us in these obscure matters.

* Tedlez, a town in Algiers, lat. 36° 57' N. long. 1° 55' 48" E. from Paris.—P.

^b Young, an English captain, found it exactly the same in 1774.

^c Woodville had just come from Sierra Leone, a distance of twenty-three miles, where he had rectified his longitude.

^d This work, communicated to us by our learned friend, M. Langlès, cites manuscript observations and charts.

^e It is known that the ship Glatton has found the longitude more westerly.

^f The longitude is concluded from that of Annabona, St. Thomas, &c.

^g This combined position is still further confirmed by Capt. Flinders.

Sancasse Island, (Naranda Bay)	14 31 0	45 25 0	Idem.	Amsterdam,	37 51 0	75 27 0	Orient. Nav. mean of several observations. ^h

^a According to numerous recent observations, Jean de Nova is the same as the Island of St. Christopher.
^b Probably by mistake of the copyist, or from the obscurity of the manuscript sent from the Isle of France, it is marked in the *Annales des Voyages*, 20° 10' S.
^c A mean taken between De Mannevillette and several English observers.
^d The English longitudes appear to be too westerly.
^e It is inhabited by the captain of a French privateer and some negroes.

^f These positions result from the mean taken between several English and French observations.
^g It is at present inhabited by a small number of French and other families.
^h The Oriental Navigator, like most of the English writers, applies to the island of Amsterdam what belongs to the island of St. Paul, and vice versa. The Requisite Tables give the names in their true and original sense.

^a The difference of four degrees of longitude is too trifling in this latitude, and in so foggy a sea, to admit of any doubt of the identity of this island with the Cape Circumcision of Lozier de Bouvet.
^b The Oriental Navigator asserts, that this longitude, determined by thirty-two series of lunar distances, is regarded as the most accurate.

^c See page 150.
^d It is probable, however, that the Island of Ferro is placed some minutes too far to the east, and that its centre is twenty degrees west of Paris, or under the ancient first meridian.

BOOK LXXV.

DESCRIPTION OF AMERICA.

General Reflections.—Origin of the Americans.

THE history of geographical discoveries leads us repeatedly^a to the shores of the New World: we follow to them the ancient navigators of Scandinavia;^b and, after seeing the notices which they had collected, become lost or obscured,^c we again accompany the immortal Columbus to that continent which ought to have been honoured with his name.^d We are now about to traverse, in the progress of description, the different regions of this part of the world; but, conformably to our usual method, we shall, first of all, cast a glance over its general features, as well as the race of men by which it is inhabited.

The spirit of system has sometimes exaggerated the points of resemblance, sometimes the differences, which have been supposed to be observable between America and the old continent. The external forms of the new continent, it is true, strike us at first sight by the apparent contrast which they afford with the old. The immense island, composed of Asia, Africa, and Europe, viewed as one entire region, presents an oval figure, of which the greater diameter is considerably inclined to the equator; its outline is pretty equally interrupted on both sides by gulfs and inland seas; and the rivers descend from each in nearly equal proportions. In America, on the contrary, we perceive a lengthened, irregular, indefinable figure, with the principal dimension running almost in the direction of the poles; two great peninsulas are united together by a long isthmus, which, whether we consider its form, or the primitive rocks of which it is composed, bears no resemblance whatever to the isthmus between Africa and Asia; immense gulfs, the mediterranean seas of America, open on the eastern side, while, on the opposite coast, we perceive an unbroken shore, with only some slight indentations at the extremities; and, finally, the great rivers, almost without exception, flow towards the Atlantic.

These actual differences, nevertheless, disappear, or at least become less important, when, on contemplating the general outline of the globe, we perceive that America is merely a continuation of that belt of elevated land, which, under the names of the plateau of Caffraria, of Arabia, of Persia, and Mongolia, forms the spine of the ancient continent, and, scarcely interrupted at Behring's Straits, constitutes also the Rocky or Columbian Mountains, the plateau of Mexico, and the great chain of the Andes. This

zone of mountains and plateaus—like a vast ring, crumbled and fallen upon its encircled planet—presents, generally speaking, a shorter and more rapid declivity towards the basin of the great Austro-Oriental Ocean, of which the Indian Ocean constitutes a part,^e than towards the Atlantic and Polar Seas. This, then, is the great leading feature common to both continents—a feature in which the smaller apparent differences are lost.

This correspondence and continuity of the two great islands of the globe, already leads us to reject the idea of the more recent origin of America—an opinion which one is almost ashamed of being under the necessity of refuting, since it is contrary to the established laws of hydrostatics. Yet, how many opinions are maintained in geology, which are contrary to the laws of physics! We must, therefore, repeat, that the level of the sea being necessarily, within a few feet, every where the same, no considerable tract of country can be either more ancient, or, especially, more recent than the rest.^f The expression, *New Continent*, ought merely, therefore, to recall the chronological order of our knowledge.

The general level of America in reality presents a remarkable difference from that of the old continent. This difference does not consist in the greater height of its mountains; for, if the Cordilleras of Peru rise, by some of their summits, twenty thousand feet, we are now almost certain that the mountains of Thibet attain an equal, and perhaps a still greater elevation. But the plateaus, which support these mountains, are separated in America from the low plains by an extremely short and rapid declivity. Thus, the *region of the Cordilleras*, and that of the *table land of Mexico*—aerial, temperate, and salubrious tracts of country—come in immediate contact with the plains watered by the *Mississippi*, the *Amazon*, and the *Parana*. Even these plains, whatever may be their nature—whether they are covered with tall and waving plants, as the *savannahs* of the Missouri; or offer to the view, like the *Llanos* of Caraccas, a surface, at one time burnt up with the sun, and at another refreshed by tropical rains, and clothed with superb grasses; or whether, in fine, similar to the *Pampas*, and to the *Campos Parexis*, they oppose to the fury of the winds their hills of moving sand, intermingled with brackish ponds, and covered with saline plants; all of them preserve, for immense distances, a very low le-

^g There are many extensive tracts of country, such as the shores of the southern states, and the country S. and S. E. of the Baltic, which seem to have been originally formed in the bosom of the ocean. Whether the sea has retired and left them bare, or whether they have been raised above the waters by a force acting from beneath, is not yet determined. Such elevations have been recently caused by earthquakes; and perhaps this is the most satisfactory explanation.—P

vel, rarely interrupted by rising ground: for the ridge of the *Apalachian* or *Alleghany* mountains, in North America, and that of the *Cordilleras of Brazil*, in South America, are only connected with the great central chain of the *Cordilleras* by plateaus of little elevation, or by mere acclivities, and inconsiderable eminences.^a

From this vast extent of the American plains, results the immense length of the rivers which water that part of the globe. Of this, the following table may convey an idea:—

LENGTH AND COURSE OF AMERICAN RIVERS.

<i>Basin of the Great Ocean.</i>		Length in leagues of 25 to a degree.
Colombia, or Tacoutche-Tesse ^b		
San-Felipe, (<i>suggested course</i>)		300
Colorado		260
<i>Unknown Basin.^c</i>		
Mackenzie, with the Unjigah (<i>Peace River</i>)		625
<i>Basin of Hudson's Bay.</i>		
Saskashawan, with the Nelson (<i>its outlet</i>)		460
Assiniboil, with the Severn		600
Albany		230
<i>Basin of the Atlantic, (NORTH AMERICA.)</i>		
The River St. Lawrence, (<i>from Ontario</i>)		220
Ottawa, (<i>its tributary</i>)		170
Connecticut		100
<i>Basin of the Gulf of Mexico, (subordinate to the Atlantic.)</i>		
Mississippi, (<i>alone</i>)		575
Missouri, with the lower Mississippi		980
Its tributaries,	Platte River	270
	Ohio	220
	Arkansas	410
	Red River	350
Rio del Norte		500?
<i>Basin of the Caribbean Sea, (same.)</i>		
Magdalena		250
<i>Basin of the Atlantic, (SOUTH AMERICA.)</i>

San-Francisco		425
Parana, or Rio de la Plata		710
Its tributaries,	Paraguay	400
	Pilcomayo, (<i>a tributary of the preceding</i>)	340
	Vermejo	220
	Salado	250
Uraguay		220
Moyale-Levou, (<i>Leuvu,</i>) or Colorado		360
Cusu-Levou, (<i>Leuvu,</i>) or Negro		180

Owing to this continuation of the same level, the respective basins of the rivers are no where less distinct; for some are divided by mere ridges, and frequently even these are deficient. Accordingly, many rivers mingle at the early part of their course those waters which are destined for different estuaries. Thus, the Oronoco, and the Rio Negro, a tributary to the Amazon, communicate by the *Cassiquiari*; and a similar branch unites the *Beni* and the *Madeira*.

^a See "The Levels of the Continents," pl. 4. of vol. I. of this summary; or, the Levels of Mexico, in the Atlas of M. de Humboldt.

It appears certain that, in the rainy season, a boat might pass from the tributary streams of the Paraguay into those of the Amazon, which wind along the elevated plain called *Campos Parexis*. In North America, the same circumstance has produced an infinite number of lakes. The *Slave Lake*, the *Assiniboil*, and the *Winnipeg*, are surrounded by a hundred others, that are likewise of a very considerable size, and by many thousand lesser ones, which in general are bordered by low ridges of rocks, like those of Finland. The country becomes less covered with water as we advance towards the south. Still, nevertheless, *Lake Superior*, *Michigan*, *Huron*, *Erie*, and *Ontario*, in Canada, form as it were a sea of fresh water, whose superfluous waters precipitate themselves by the river Saint Lawrence, into the Atlantic Ocean. South America, under a more burning climate, sees its lakes rise and disappear with the rainy season. The *Xarayes*, and the *Ybera*, are of the number of these more or less periodical lakes; amongst which the *Parima*, when better known, will one day take its place.

From this general division of America into lofty mountainous plateaus, and very low plains, there results a contrast between two climates, which, although of an extremely different nature, are in almost immediate proximity. Peru, the valley of Quito, and the city of Mexico, though situated between the tropics, owe to their elevation the genial temperature of spring. They behold even the *Paramos*, or mountain ridges, covered with snow, which continues the whole year upon some of the summits, while, at the distance of a few leagues, an intense and often sickly degree of heat suffocates the inhabitants of the ports of Vera Cruz and Guayaquil. These two climates produce each a different system of vegetation. The flora of the torrid zone forms a border to the fields and groves of Europe. Such a remarkable proximity as this, cannot fail of frequently occasioning sudden changes, by the displacement of these two masses of air, so differently constituted,—a general inconvenience, experienced over the whole of America. Every where, however, this continent is exposed to an inferior degree of heat. Its elevation alone explains this fact, as far as regards the mountainous region; but why, it may be asked, does it extend to low tracts of country? To this an able observer makes the following reply: "The trifling breadth of this continent; its elongation towards the icy poles; the ocean, whose unbroken surface is swept by the trade winds; the currents of extremely cold water which flow from the Straits of Magellan to Peru; the numerous chains of mountains abounding in springs, whose summits, covered with snow, rise far above the region of the clouds; the great number of immense rivers that, after innumerable curves, always tend to the most distant shores; deserts, but not of sand, and consequently, less susceptible of being impregnated with heat; impenetrable forests, that spread over the plains of the equator, covered with rivers, and which, in those parts of the country that are the farthest distant from mountains and from the ocean, give rise to enormous masses of water, which are either attracted by them, or are formed during the act of vegetation: all these causes produce, in the lower parts of America, a climate which, from its coolness and humidity, is singularly contrasted with that of Africa. To these causes alone, must we ascribe that abundant

^b See note, p.

^c Basin of the Polar Sea?—P.

vegetation, so vigorous and so rich in juices, and that thick and umbrageous foliage, which constitute the characteristic features of the new continent."^a

Assuming this explanation as sufficient for South America and Mexico, we shall add, with regard to North America, that it scarcely extends any distance into the torrid zone; but, on the contrary, as we shall see in the succeeding book, stretches, in all probability, very far into the frigid zone, and, unless the revived hope of a North-West passage be confirmed, may, perhaps, reach and surround the pole itself. Accordingly, the column of cold^b air attached to this continent, is no where counterbalanced by a column of equatorial air. From this results an extension of the polar climate to the very confines of the tropics; and hence winter and summer struggle for the ascendancy, and the seasons change with astonishing rapidity. From all this, however, New Albion and New California are happily exempt; for, being placed beyond the reach of the freezing winds, they enjoy a temperature analogous to their latitude.

The productions of America offer some peculiarities. The most indisputable of these, is its abounding so remarkably with gold and silver, which are met with even on the surface of the soil, but principally in veins of the schistose rocks, which compose the Cordilleras of Chili, of Peru, and of Mexico. Gold is met with in the greatest quantity in the former of these regions, and silver in the latter. To the north of the mountains of New Mexico, the plains, marshes, and little ridges of rocks, frequently contain vast beds of copper. Before we inquire how it happens that the New Continent is distinguished for such immense mineral riches, it would no doubt be well to inquire whether or not the interior of Africa conceals similar metalliferous regions; nay, whether even that of Asia did not formerly contain what, in the present day, is exhausted? Taking for granted that America is decidedly superior in this point of view, it must, nevertheless, be avowed, that the situation of its minerals, the position of its mines, and the other circumstances of its physical geography, have not hitherto been described with so much care, as to enable us to indicate the cause of this superiority.

In America, as in all other regions of the world, the animal tribes appear to bear a proportion, both in their number and their size, to the extent of the country which has given them birth. The musk ox and the bison of North America, and the Magellanic ostrich of South America, equal in size the corresponding species of the old world; the elk or stag of New California even attains a gigantic magnitude; but all the other quadrupeds, such as the lama, the guanaco, the jaguar, and the anti, yield in size as well as strength, to the same description of animals in Asia and Africa. This fact, however, is by no means exclusively confined to the New Continent. The animals of New Holland with which we are acquainted, are smaller than those of America; and the same decrease of animal life might no doubt be remarked between New Holland and Madagascar or Borneo, if the present state of our knowledge enabled us to draw such a parallel.

Vegetable life, which depends on moisture, shows, on the contrary, over the greater part of America, a singular degree of vigour. The pines that shade the Columbia, whose trunks rise perpendicularly to a height of three hundred feet, deserve to be considered as the giants of the vegetable world. Next to these might be named the plane trees^c and tulip trees of the Ohio, having a circumference of from forty to fifty feet. The low parts of the country, both in South and North America, are covered with extensive forests; and yet, nevertheless, the barrenness of a part of the region of the Missouri, of the plateaus of New Mexico, of the Llanos of Caraccas, of the Campos Parexis, and of the Pampas; or, in other words, of fully one quarter of this continent, ought to deter us, in respect to its vegetation, from employing all those exaggerated expressions which are servilely copied from one description to another.

The absolute difference that exists between a great number of the animals and vegetables of America, and those of the old world, constitutes a fact of a more positive nature. With the exception of the bear, the fox, and the rein-deer, which endure with impunity the rigours of the frigid zone; of the seal and the whale tribes, inhabitants of all the shores, and of the *Didelphis*,^d probably introduced into Peru by a colony from the islands of the Great Ocean—all the animals of both Americas appear to form particular species, or, at least, distinct races. Even the American rein-deer, or the *caribou*, has never been seen in Siberia. The *original*^e is a variety of our elk; but the latter never passes the southern latitudes of Siberia. The same remark is applicable to the great wild sheep, said to be met with in the interior of California. The bison, and the musk ox,^f which pasture from the lakes of Canada to the seas of California; the cougar and jaguar, whose roars resound in distant echoes, from the mouth of the Rio del Norte to the regions south of the Amazon; the anti, or tapir, conveying a faint sketch of the elephant; the pecari, and the patira, bearing a resemblance to the wild boar; the cabiai, agouti, paca, and other species analogous to the rabbit; the ant-eaters, tamanduas, tamanoirs,^g all devourers of insects; the indolent and feeble sloth;^h the useful lama, with the vicunna; the nimble sapajou; the gaudy parrot, and the brilliant humming bird, all differ essentially from those very animals of the old continent to which they make the closest approach. All the animals thus peculiar to America, form, like those of New Holland, a distinct family, and are evidently aboriginal in the country which they inhabit. Would any one, in fact, attempt to affirm, that the cougar and jaguar have swam across thither from Africa? or can it be supposed that the tou-you,ⁱ borne on its feeble wings, could have traversed the Atlantic Ocean? Certainly no one will maintain that the animals of Peru and Mexico could have passed from Asia into America; since none of them can live in the frigid zone, which they must, first of all, have necessarily crossed. It is equally impossible to suppose, that all the animals existing on the globe, are derived from America; and, consequently, those who would place the *terrestrial paradise*

on the banks of either the Amazon or La Plata, would make just as little progress in this investigation as they who assign it a situation on the Euphrates. Nothing, therefore, remains, but the accommodating resource of a tremendous convulsion of nature, with a vast tract of country swallowed up by the waves, which formerly united America with the temperate regions of the old world. Such conjectures as these, however, being devoid of all historical support, do not merit a moment's consideration. Consequently, we cannot refrain from admitting, that the animals of America originated on the very soil, which, to this present day, they still inhabit.^a

This origin once admitted, we must direct our attention to a circumstance which is common to both continents. Those species which, in America, represent the lion and tiger, inhabit the torrid zone, and seem to derive from the heat of a burning climate the ferocity with which they are animated. In the same country, the form of the anti or tapir, slightly recalls to our recollection that of the elephant; thus the prolongation of the cartilages appears to belong to the torrid zone. The birds with imperfect wings and irregular^b plumage; the ostrich of Africa, and the cassowary of New Holland, seem to claim a natural kindred with the touyou of South America. The large insects, the enormous reptiles, and the birds with splendid and variously coloured feathers, people the warmer regions of either continent. The climate of their temperate regions seems to have produced the same effects on the animals which inhabit them. The two varieties of the ox that inhabit the plateaus of California and the savannahs of the Missouri, have neither the habits nor the characteristic features of the ferocious buffalo of Caffraria. The wild sheep, and the lama—that intermediate animal between the sheep and the camel—like their prototypes on the old continent, delight in the pastures of the desert. In the two worlds, there is a resemblance in every thing, but nothing is identically the same.

These reflections lead us to a very difficult question. The races of animals of which there no longer exist any individuals in the present day, and with which we are acquainted only by means of the fossil bones that are discovered in the earth, belong, in general, to an order of things very different from the actual condition of the globe, and anterior to the existence of man. May there not, however, be an exception in favour of the fossil elephant of the Ohio,^c and of the megatherium of Paraguay? Buried in unconsolidated and superficial strata, the remains of these animals may have belonged to a race which became extinct at a comparatively modern epoch.^d An exact description of the situation in which these fossil remains have been found can alone decide the question.

After having admitted an animal creation peculiar to America as well as to New Holland, ought we likewise to conclude, that the Americans are a distinct race of peo-

ple? We are not, it is true, obliged to discuss this subject, as it is not within the bounds of positive history; for no history ascends to so remote a period. We ought, nevertheless, to admit, as an established fact, that the Americans, whatever their origin may be, constitute, in the present day, by their physical characters, not less than by their peculiar idioms, a race essentially different from the rest of mankind. The truth of this proposition has been demonstrated by a long series of physiological observations. The natives of this part of the world are, in general, of a large size,^f of a robust frame, and a well proportioned figure, free from defects of organization. Their complexion is of a bronze, or reddish copper hue—rusty-coloured as it were, and not unlike cinnamon or tannin. Their hair is black, long, coarse, and shining, but not thickly set on the head. Their beard is thin, and grows in tufts. Their forehead is low, and their eyes are lengthened out, with the outer angles turned up towards the temples; their eyebrows high, their cheek-bones prominent; their nose a little flattened, but well marked; their lips extended, and their teeth closely set and pointed. In their mouth, there is an expression of sweetness which forms a striking contrast with the gloomy, harsh, and even stern character of their countenance. Their head is of a square shape, and their face is broad, without being flat, and tapers towards the chin. Their features, viewed in profile, are prominent, and deeply sculptured. They have a high chest, massy thighs, and arched legs, their foot is large, and their whole body squat and thick set.^g Anatomy likewise enables us to ascertain that in the cranium, the superciliary arches are more strongly marked; the orbits of the eye deeper; the cheek-bones more rounded, and better defined; the temporal bones less curved; the branches of the lower jaw less diverging; the occipital bone not so convex; and the facial line more inclined than among the Mongol race, with which it has been sometimes attempted to confound them. The shape of the forehead and of the vortex most frequently depends on the employment of artificial means;^h but, independently of the custom of disfiguring the heads of infants, there is no other people in the world in whom the frontal bone is so much flattened above.ⁱ Generally speaking, the skull is light.

Such are the general and distinguishing characteristics of all the American nations, with the exception, perhaps, of those who occupy the polar regions at its two extremities.¹ The Hyperborean Esquimaux, as well as the Southern Puelches, are below the middle stature, and in their features and figure present the greatest resemblance to the Samoiedes.^m The Abipones, and still more especially the Patagonians, attain a gigantic height. This strong and muscular constitution of body, together with a tall figure, is in a certain degree met with among the natives of Chili, as well as among the Caribs who inhabit the plains of the Delta of the Oronoco, as far the sources of the Rio-

^c Mastodon?—P.

^d This remark would apply with more force to the fossil elephant of Siberia, which has been even found imbedded in the ice on the shores of the Arctic Sea, and yet is considered as an extinct species. But the mere fact that they are found in unconsolidated and superficial strata is not alone sufficient to prove their recent origin. A large part of the tertiary strata, and nearly all the diluvial strata, are in that state, and yet no human remains have been found in them.—P.

Blanco,^a and amongst the Arkansas, who are esteemed among the handsomest savages of this continent.^b

All reasoning upon the causes of the variety of colours of the human skin, are here at variance with observation: because the same copper or bronze hue is, with some slight exceptions, common to almost all the nations of America, without the climate, the situation, or the mode of living, appearing to exercise the slightest influence. Will the Zambos, formerly denominated Carribbeans, of the Island of St. Vincent, be cited in opposition to this opinion? They exhaled, in fact, that strong and disagreeable odour which seems to belong peculiarly to the negro.^c Their blackish skin, presented that silky softness to the touch, which is so particularly observed among the Caffres; but they were descended from a mixture of the natives with the African race.^d The true Carribbeans are red.

The colour of the natives of Brazil and of California is deep,^e although the latter inhabit the temperate zone, and the former live near the tropic. The natives of New Spain, says M. de Humboldt,^f are darker coloured than the Indians of Quito and of New Grenada, who inhabit a precisely analogous climate. We even find that the tribes dispersed to the north of the Rio Gila, are browner than those that border on the kingdom of Guatimala. The people of the Rio Negro are darker than those of the Lower Oronoco, yet the banks of the former of these two rivers enjoy a cooler climate. In the forests of Guiana, especially near the sources of the Oronoco, there exists several tribes of a whitish complexion, who never have mingled with Europeans, and are surrounded by other tribes of a dark brown.^g The Indians who, in the torrid zone, inhabit the most elevated table-lands of the Cordilleras of the Andes: these who under the 45° of south latitude, live by fishing in the islands of the Archipelago of Chonos, have a complexion as much copper-coloured as they who cultivate under a burning sun the banana in the narrowest and deepest valleys of the equinoctial regions. To this it must be added, that the Indians who inhabit the mountains are clothed, and were so long before the conquest, while the aborigines that wander on the plains are perfectly naked, and, consequently, are always exposed to the perpendicular rays of the sun. Every where, in short, it is found that the colour of the American depends very little on the local situation which he actually occupies;^h and never, in the same individual, are those parts of the body that are constantly covered, of a fairer colour than those that are in contact with a hot and humid air. Their infants are never white when they are born; and the Indian Caciques, who enjoy a considerable degree of luxury, and who keep themselves constantly dressed in the interior of their habitations, have all the parts of their body, with the exception of the palms of their hands and the soles of their feet, of the same brownish red, or copper colour.

This deep tint continues to be met with as far as the remotest coast that borders on Asia. It is only under 54° 10' north latitude, at Cloak bay, in the midst of Indians with a copper-coloured skin, and with small and very long eyes,

that a tribe is thought to have been distinguished, who have large eyes, European features, and skin of a lighter colour than that of even our own peasants. Michikinakou, the chief of the Miamis, spoke to M. Volneyⁱ of Indians in Canada, who only become brown by exposure to the sun, and by rubbing their skin with fat and the juices of herbs. According to Major Pike,^k the intrepid Menominies are distinguished by the beauty of their features, by their large and expressive eyes, and by a complexion of a clearer tint than any of the other bands of the Chippeways. The expression of their countenance at once breathes sweetness, and a noble independence. They are all of them finely formed, and are of a middle stature. The Li-Panis,^l who, to the number of about 800 warriors, wander from the banks of the Rio Grande to the interior of the province of Texas, in New Mexico, have light hair, and, in general, are fine looking men. According to Adolphus Decker,^m who, in 1664, accompanied the Dutch admiral PErmitte round Cape Horn, people are likewise met with at Terra del Fuego, who are born white, but who paint their bodies red and other colours. These trifling anomalies, however well authenticated, would only tend still more strongly to prove, that, notwithstanding the variety of climate and elevation inhabited by the different races of mankind, nature never deviates from the laws under which she has acted for many thousand years.ⁿ

The beard, which travellers formerly refused to the Americans, is at last restored and confirmed to them in the present day. The Indians who inhabit the torrid zone of South America, have generally a small beard, which becomes larger by shaving. Still, however, there are many individuals who have neither beard nor hair on any part of their person except their head. Galeno^o informs us, that among the Patagonians there are many old men who have beards, although they are short and thin. Almost all the Indians in the environs of Mexico, wear small mustachios, which modern travellers have likewise discovered among the inhabitants of the north-west coast of America. When we collect together, and compare all these different facts, it appears a conclusive inference that the Indians have a larger quantity of beard, in proportion to their distance from the equator. Besides, this apparent want of beard is a distinguishing feature which does not exclusively belong to the Americans. Many hordes of eastern Asia, the Aleutians, and, especially, some nations of African negroes, have so very little beard, that one might almost be tempted to deny altogether its existence. The negroes of Congo and the Caribs, two remarkably robust races of men, who are often of a colossal size, prove that it is nothing more than a physiological dream to look upon a beardless chin as a certain indication of degeneracy and physical weakness in the human species.

These physiological characters undoubtedly, establish a close affinity between the Americans and the Mongol race, that inhabits the northern and eastern parts of Asia; as well as the Malays, or the fairest of the natives of Polynesia, and of the other archipelagos of Oceanica. This

resemblance, however, which does not extend beyond the mere colour, cannot apply to the more essential parts—the cranium, the hair, and the profile. If, in the system of the unity of the human species, the Americans be considered as a branch of the Mongol race, it must be supposed that, during an almost countless succession of ages, it has been separated from its parent trunk, and subjected to the gradual influence of a peculiar climate.

Next to physiological characters, language is the most indisputable proof of the common origin of different nations. It is from the languages of America that the most positive indications^a have been supposed to be derived of that emigration of the people of Asia, to which the population of the new world has been ascribed. Mr. Smith Barton was the first who gave any thing like consistence to this hypothesis, by comparing together a great number of different American and Asiatic idioms.^b These analogies, as well as those which have been collected by the Abbé Hervas,^c and M. Vater,^d are, no doubt, too numerous to be looked upon as the mere result of chance; and yet, after all, as M. Vater remarks, they prove nothing beyond single communications, and partial emigrations. Of geographical connexion, they are almost completely destitute; and, without this concatenation, how is it possible to deduce from them any rational conclusion?

We have revised the researches of the three above named learned individuals, and although we have not any very extensive materials at our disposal, we have obtained results which, at one time, led us to believe, that we were on the point of demonstrating, as an historical truth, the entirely Asiatic origin of the languages of America.

We have, in the first place, discovered the undeniable geographical connection of many leading words, which have been propagated from Caucasus and the Ural mountains, to the Cordilleras of Mexico and Peru. Nor is it to be imagined that these are mere syllables, which we force into a resemblance by dint of etymological dexterity; for, they are entire words, disfigured only by terminations, or inflexions of sound, and of which our readers might almost trace the steps of emigration. The most striking objects in the heavens, and on the earth; the most interesting relations of human nature; the first wants of life;—such are the links by which many of the languages of America are connected with those of Asia. Some affinities even, of a more metaphysical description, are observed in the pronouns and numerals. Here, however, the chain is more frequently broken. But, this is not all; during our researches this geographical concatenation has often presented itself under the form of a double and triple line of communication. Sometimes these lines are confounded together at intermediate points, about Behring's Straits and in the Aleutian Islands; but they are distinguished by their terminal links. The number of established analogies is more than double what had been previously observed. In fact, it is not a single denomination of the sun, the moon, the earth, the two sexes, or the parts of the human body, which has passed from one continent to the other; there are two, three, or four different denominations, derived

from languages of Asia, acknowledged to belong to different roots.^e

So many unlooked for affinities—and such, too, as had not been detected by our predecessors, might almost have induced us to maintain, with a certain degree of confidence, the purely Asiatic origin of the principal languages of America. But, sincerely devoted to the interests of truth, we will not attempt to erect an imposing and hazardous assertion on the mere basis of our own observations,—on the contrary, we will candidly avow, that the analogies between the idioms of the two continents, although raised by our researches to a new degree of certainty and importance, merely authorize us to draw the following conclusions:—

1st, Asiatic tribes connected by descent and idiom with the Finnish, the Ostiak, the Permian, and the Caucasian nations, have emigrated towards America, by following the coasts of the Frozen Sea, and by crossing Behring's Straits. This emigration extended to Chili and Greenland.

2d, Asiatic tribes, connected by descent and by idiom with the Chinese, the Japanese, the Ainos, and the Kurilians, have passed into America, by proceeding along the shores of the Great Ocean. This emigration extended at least as far as Mexico.

3d, Asiatic tribes, connected by descent and idiom with the Tungusians, the Mantchoos, the Mongols, and the Tartars, have extended themselves, by following the heights of the two continents, as far as Mexico and the Apalachian mountains.

4th, None of these three emigrations have been sufficiently numerous to efface the original character of the indigenous nations of America. The languages of this continent have received their development, their grammatical formation, and their syntax, independently of all foreign influence.

5th, These emigrations have taken place at an epoch at which the Asiatic nations only knew how to count as far as two, or, at most, three, and had not completely formed the pronouns of their languages.^f It seems probable that the emigrants from Asia brought with them merely dogs, and, perhaps, hogs; and that they knew how to construct canoes and huts; but they did not give any particular name to the divinities which may have been the objects of their worship, nor to the constellations, nor the months of the year.

6th, Some Malay, Javanese, and Polynesian words may have been conveyed to South America by a colony from Madagascar, with greater facility than by the Great Ocean, where the winds and currents do not favour an easterly navigation.

7th, A certain number of African words appear to have been introduced by the same channel as the Malay and Polynesian terms; neither the one nor the other, however, have yet been detected in sufficient numbers to form the basis of an hypothesis.^g

8th, The words of the European languages which seem to have passed into America, are derived from the Finnish and Lettish^h languages; and are connected with the new

^h A dialect of Lithuania, spoken in Riga, Courland, Jager, and Livonia. *Zeitungs*, cap. 684. [The Lettish or Lettonian languages or dialects form a peculiar family, considered by Adelung as intermediate between the Teutonic and Slavonic, formerly spoken along the southern shores of the Baltic, from the Vistula to the Dwina, now confined to Livonia and Courland, and a few districts in E. Prussia and N. Lithuania.—P.]

continent by the Permian, Ostiak, and Yukagir languages. Nothing in the Persian, German, or Celtic; nothing in the Shemitic^a languages, or those of western Asia; nothing in those of northern Africa, indicates former emigrations towards America.

This is the result of our researches and of those of our predecessors. Some Asiatic idioms have penetrated into America; but the general aggregate of the languages of this continent—like the race of people by which they are spoken—presents a distinct and original character. We will now proceed to consider their general affinity.

Among the prodigious number of very different idioms which are met with in the two Americas, some of them extend themselves over a vast expanse of country. In South America, Patagonia and Chili appear, in some measure, to possess only one single language. Dialects of the language of the *Guaranis* are diffused from Brazil to the Rio Negro, and even, by means of the *Omagua* idiom, as far as Quito itself. There is an analogy between the languages of the *Lule* and of the *Vilela*; and a still greater between those of *Aymara*^b and of *Sap'bocona*, which decidedly have almost the same numeral terms. The *Quichua* language, the principal one of Peru, partakes equally with those last mentioned in many numeral terms, exclusive of the analogies which it offers with the other languages of the neighbouring country. The idiom of *Maypure* is intimately connected with those of *Guipunavi* and *Caveri*. It has likewise considerable affinity with the *Avanais*, and has given rise to the idioms of *Meepure*, of *Parene*, of *Chirrupa*, and of many others that are spoken on the banks of the Rio Negro, the higher *Oronoco*, and the *Amazon*.^c The Caribs, after having exterminated the *Cabres*, extended their language with their empire, from the equator to the *Virgin* islands. According to the assertion of a missionary, the *Galibi* language enabled him to communicate with all the natives of this coast, the *Cumangoles* alone excepted.^d Gili considers the Caribbean as the parent language of twenty others, and particularly of that of *Tamanaca*, by which he was able to make himself understood almost every where on the lower *Oronoco*.^e The *Saliva* language is the original of the *Ature*, *Piaroa*, and *Quaqua* idioms; and the *Taparita* comes from the *Otomaca*.

In North America, the language of the *Aztecs* extends from Lake Nicaragua to the 37th degree, along an extent of four hundred leagues.^f It is less sonorous, but fully as rich as that of the *Incas*. The sound *tl*, which, in the *Aztec*, is only added to nouns, is met with in the idiom of *Nootka* as the termination of verbs. In the idiom of *Cora*, the principal forms of the verb are similar to the *Aztec* conjugations, and the words present some affinities.^g After the Mexican, or *Aztec* language, that of the *Otomites* is the one that is most generally spoken in New Spain. But, besides these two principal languages, there are, between the isthmus of Darien and the 23d degree of latitude, a score of others, to fourteen of which we are already in possession of very complete grammars and dictionaries. The greater number of these languages, far from being

mere dialects of one only, are at least as different from one another as the Greek is from the German, or the French from the Polish. It is only between the *Huastec* idiom and that of *Yucatan*, that some resemblance is discovered.

New Mexico, California, and the north-west coast, form a region which is still but little known; and it is precisely from these that Mexican tradition derives the origin of many nations. The languages of this region would constitute a very interesting subject of research; yet we scarcely possess more than a vague idea of them. There is a great conformity of language between the *Osages*, the *Kansas*, the *Ottos*, the *Missouris*, and the *Mahas*.^b The guttural pronunciation of the fierce *Sioux*, is common with the *Panis*.ⁱ The language of the *Appaches* and the *Panis* extends from Louisiana to the sea of California.^k The *Estenes* and the *Runselen*, in California,^l likewise speak a widely extended idiom.

The *Tancards*, on the banks of the Red River, are remarkable for a peculiar clucking sound; and their language is so poor that they express one half of their ideas by signs.^m

In the southern provinces of the United States, as far as the Mississippi, there is an immediate affinity between the idioms of the *Choctaws* and of the *Chickasaws*, which have likewise some appearance of being connected with that of the *Cherokees*. The *Creeks* or *Muskogees*, and the *Catawbias*, have borrowed words from them. Farther to the north, the once powerful tribe of the *Six Nations* speaks one single language, which, amongst others, forms the dialects of the *Senecas*, *Mohawks*, *Onondagoes*, *Cayugas*, *Tuscaroras*, *Cochnewagoes*, *Wyandots*, and *Oneidas*. The numerous *Nadowessians* have a separate idiom. The dialects of the *Chippaway* language are common to the *Penobscots*, the *Mahicannis*,ⁿ the *Minsis*,^o the *Narragansets*, *Naticks*, *Algonquins*, and *Knistenaux*. The *Miamis*, with whom *Charlevoix*^p classes the *Illinois*, also borrow from them some words and forms. Lastly, on the confines of the *Knistenaux*, in the most remote part of the north, the *Esquimaux* are met with, whose idiom extends from Greenland to *Oonalaschka*.^q Even the language of the *Aleutian* islands appears to possess an intimate resemblance with the dialects of the *Esquimaux*, in like manner as these do to the *Samoiede* and *Ostiak*. In the midst of this belt of polar nations—resembling each other in language as well as in complexion and form—we find the inhabitants of the coasts of America, at *Behring's Straits*, constituting, with the *Tchuktchis* in Asia, an isolated family, which is distinguished by a particular idiom, and a more imposing figure, and, in all probability, originating from the new continent.

This great number of idioms proves that the greater portion of the American tribes have long existed in that savage solitude in which they are still plunged. The family, or tribe, that wanders in the forests, engaged in the chase, and always armed against other families, or other tribes, whom they are afraid of encountering, necessarily invent words of command, and rallying expressions, in fact, cant terms

of war, which serve alike to guard them from sudden surprise and from treachery. Thus, the Menominies, a tribe of upper Louisiana, speak so singular a language, that no white has ever been able to learn it. All of them, however, understand the Algonquin, and make use of it in their negotiations.^a

On the other hand, some of the American languages present so artificial and ingenious a composition, that one feels irresistibly disposed to ascribe the invention of them to some ancient civilized nation. I do not mean nations civilized to the modern scale, but such as the Greeks were in the time of Homer; having their moral ideas developed, their sentiments elevated, and their imagination vivid and cultivated; in short, who had sufficient leisure to yield themselves up to meditation, and to form abstract ideas.

It is on the formation of the verb, that the inventors of the American languages have principally exercised their genius. In almost all the idioms, the conjugation of this part of speech tends to mark, by particular inflexions, each particular relation between the subject and the action, or between the subject and the things by which it is surrounded, or more generally speaking, the circumstances in which it is placed. It is thus that all the persons of the verbs are susceptible of assuming particular forms, for the purpose of expressing the pronominal accusatives, which may be attached to them as an accessory idea, not only in the languages of Quichua and of Chili, which differ totally from one another, but also in the Mexican, the Cora, the Totonaca, the Natick, the Chippeway-Delaware, and the Greenlandish.

This astonishing uniformity in so singular a method of forming the conjugations, from one end of America to the other, greatly favours the supposition of a primitive people, the common parent of the indigenous American nations. Nevertheless, when we call to mind that nearly similar forms exist in the language of Congo, and in the Basque,^b which, in other respects, have no affinity whatever, either with one another or with the American idioms, we are compelled to look for the origin of these analogies in the general nature of the human mind.

Still other grammatical refinements complete the astonishment which is excited by the languages of America.

In the different forms of the idioms of Greenland, Brazil, and the Betoï, the conjugation is changed when they speak negatively; the sign of negation is interpolated in the Moscan and the Aruwac, just as it is in the Turkish language. In all the American languages, the possessive pronouns are formed of sounds annexed to the substantives either at the commencement or the termination, and which differ from the personal pronouns. The Guarani, Brazilian, Chiquito, Quichua, Tagalian, and Mantchoo languages, have a pronoun plural of the first person, *we excluding* the third person to whom the conversation is directed, and another which comprehends this third person in the discourse. The Tamanac idiom is distinguished from the other branches of the same language, by an extraordinary copiousness in the indicative forms of the tense. In the same idiom, and in those of the Guaicures, and of the Huastecs, as well as in the Hungarian, the neuter verbs have par-

ticular inflexions. In the Aruwac and Abipon idioms, as well as in the Basque and Phœnician languages, all the persons of the verb, with the exception of the third, are marked by pronominal prefixes. The Betoï idiom is distinguished by terminations of gender, expressed by *os*, which are wanting in all the other languages of America.

If the history of American languages lead us only to vague conjecture, will the traditions, the monuments, the manners, and the customs of that country, furnish us with more satisfactory information!

When the Europeans made the conquest of the New World, its civilization was concentrated in some parts of the great chain of plateaus and of mountains. Anahuac contained the despotic state of Mexico or Tenochtitlan, with its temples bathed in human blood, and Tlascalala inhabited by a republican people not less superstitious. The *Zaques*, a species of pontiff-kings, governed from the interior of the city of Condinamarca, the mountains of Terra Firma, while the children of the Sun reigned over the valleys of Quito and Cuzco. Within these limits, the traveller still meets with numerous ruins of palaces and temples, of baths and houses of public entertainment.^c Among these monuments, the *Teocalli* of the Mexicans, alone indicate an Asiatic origin. They consist of pyramids, surrounded by others of a smaller size, called *Sho-Madon* and *Sho-Dagon*, in the Birman Empire, and *Pkah-Ton*, in the kingdom of Siam.

Other monuments, however, speak a language which, to us, is altogether unintelligible. The figures, in all probability hieroglyphical, of animals and instruments, engraved on rocks of sienite, in the vicinity of the Cassiquari; the camps, or square forts, discovered on the banks of the Ohio, furnish us with no evidence whatever. The learned of Europe have never heard any thing more respecting the inscription in Tartar characters, said to have been discovered in Canada, and sent to the Count Maurépas.^d

Other monuments of a very doubtful nature are mentioned. The paintings of the Toltecs, for example, the ancient conquerors of Mexico, clearly indicated, say they, the passage of a great arm of the sea,—an assertion which, now that the documents have disappeared, is calculated to inspire us with very little confidence.^e As to the Mexican paintings that are still met with, they possess so vague and uncertain a character, that it would be rash to consider them in the light of historical monuments.

Manners and customs depend too intimately on the general qualities of the human mind, and on circumstances that are alike common to many nations, for us to adopt them as the basis of a historical hypothesis. People that subsist by the chase and by fishing, must necessarily have the same manner of living. Although the Tunguses eat their meat raw, and merely dried in the smoke; although they take a pride in puncturing the cheeks of their children with lines and figures of a blue or black colour; although they can detect the traces of their game on the smallest tuft of bent grass;—these, after all, are merely the characteristic features of every nation that is born and educated under the same circumstances. It is, doubtless, a little more remarkable, that the Tungusian and American women, should equally have the custom of laying their infants naked in a heap of rotten wood reduced to powder.^f

^f Georgi, *Peuples de la Russie*, p. 324. Long's *Travels in Canada*, p. 54.

The same wants, nevertheless, and the same local circumstances, will explain even this resemblance. It is also worthy of remark, that, like the Americans, the ancient Scythians were in the habit of scalping their enemies; that is to say, of taking away the skin with the hair from the upper part of the head;^a although, no doubt, ferocity of disposition may have every where excited mankind to the same excesses. A certain number of more important analogies connects the religious and astronomical system of the Mexicans and the Peruvians with those of Asia. In the calendar of the Aztecs, as well as in that of the Kalmucs and Tartars, the months are designated by the names of animals.^b The four great feasts of the Peruvians coincide with those of the Chinese. The Incas, like the Emperors of China, cultivated a certain extent of ground with their own hand. The hieroglyphics and little cords in use amongst the ancient Chinese, recal in a striking manner the figured writing of the Mexicans and the *Quipos* of Peru. In a word, the whole political system of the Peruvian Incas, and of the *Zaques* of *Condinamarca*, was founded on a union of the civil and ecclesiastical powers in the person of an incarnate Deity.^c

Without attaching to these analogies any decided importance, we may remark, notwithstanding, that America, by its customs, not less than its languages, manifestly proves the former existence of communications with Asia. But these communications must have been anterior to the development of the creeds and mythologies actually prevailing amongst the Asiatic nations at the present day. Were this not the case, the appellations of some of their divinities would necessarily have been conveyed from one continent to the other.

No American tradition whatever ascends to the incalculably remote period of these communications. The people of South America have almost no historical remembrances. The traditions of the northern nations go no farther than merely assigning that region, in which the Missouri, the Colorado, and the Rio del Norte, take their rise, as the native country of a very great number of tribes.

In general, from the seventh to the thirteenth century, the population appears to have been continually flowing back towards the south and east. It is from the regions situated to the north of the Rio Gila, that those nations of warriors issued, who, one after the other, inundated the country of Anahuac. The hieroglyphical pictures of the Aztecs, have transmitted to us the remembrance of the principal epochs connected with the migration of the American people. This migration bears some analogy with the one which, in the fifth century, plunged Europe into a state of barbarism, of which, even in the present day, we still experience the fatal consequences in many of our social institutions. The nations that traversed Mexico, left behind them, on the contrary, evident traces of culture and civilization. The Toltecs appeared there, for the first time, in the year 648; the Chichimecs, in 1170; the Nahuatlacs, in 1178; the Acolhuacs and the Aztecs, in 1196. The Toltecs introduced the cultivation of Indian corn and of cotton. They constructed towns and roads, and,

above all, those great pyramids that still remain the objects of our admiration, the faces of which are very accurately adjusted to the four points of the compass. They were acquainted with the use of hieroglyphical paintings; knew how to fuse metals, and cut the hardest stones; and had a more perfect solar year than either the Greeks or Romans. The efficiency of their government manifestly proved that they were descended from a people who must themselves have previously experienced great vicissitudes in their social condition.^d Whence, however, was this civilization derived; and where is the country from which the Toltecs and the Mexicans issued?

Traditions and historical hieroglyphics bestow the names of *Huehuetlapallan*, *Tollan*, and *Azilan*, upon the original abode of these wandering nations. Nothing now indicates an ancient civilization of mankind to the north of the Rio Gila, or in the northern regions explored by Hearne, Fidler, and Mackenzie. On the north-west coast, however, between Nootka Sound and Cook's River, in Norfolk Sound and Cox's Inlet, the natives shew a decided taste for hieroglyphical paintings.^e When we advert to the monuments which an unknown people has left in southern Siberia; and compare the epoch of the first appearance of the Toltecs with that of the great revolutions of Asia, during the earliest movements of the Hiongnoux,^f we are tempted to believe that the conquerors of Mexico must have been a civilized nation, that had fled from the banks of the Irtysh, or of the Lake Baikal, to escape from the yoke of the barbarous hordes of the central plateau of Asia.^g

The great displacement of the northern American tribes is established by other traditions. All the indigenous natives of the southern United States pretend to have arrived from the west, after crossing the Mississippi. According to the opinion of the Muskogees, the great people from whom they are descended still inhabit the west. Their arrival, however, cannot be dated earlier than the sixteenth century. The Senecas were formerly their neighbours. The Delawares found on the banks of the Missouri a people who spoke their language.^h According to Mr. Adair, the Choctaws arrived with the Chickasaws, at a period subsequent to the Muskogees.

The Chippewyansⁱ alone have any tradition that seems to indicate their emigration from Asia. They once dwelt, say they, in a country situated very far to the west, from which they were driven by a wicked nation. They traversed a long lake filled with islands and ice-burges. Winter reigned on every side during their passage. They disembarked near the Copper-Mine River. These circumstances cannot possibly be applicable to any thing but the emigration of a people of Siberia, who must have crossed Behring's Straits, or some other unknown strait still more to the north. Yet, notwithstanding this tradition, the language of the Chippewyans is not of a more Asiatic character than the other idioms of America. Their name has no more a place in the immense nomenclature of Asiatic tribes, ancient and modern, than that of the Hurons, which has been so unhappily compared with the *Huïres* of Marco

Polo, and the *Huiur* of Carpin, who are merely Ouhours.^{a b}

In the last place, these traditions, monuments, and customs, as well as idioms, render it extremely probable that there must once have been invasions of the new continent by Asiatic nations; but, at the same time, every circumstance concurs to throw back the epoch of these events to the darkness of ages anterior to history. The arrival of a colony of Malays, mixed with Madagascars^c and Africans, is a very probable event, but is enveloped in still more impenetrable obscurity. The general mass of the native population of America is indigenous.

After having thus detailed the whole of our researches and our conjectures respecting the origin of the Americans, it would be a source of useless fatigue to our readers, were we to enter into a long analysis of all the opinions that have been advanced on this subject. It suffices to know that every thing has been imagined. The very convenient resource of the dispersion of the Israelites, has been brought forward by a great number of writers, amongst whom only one deserves notice, the Englishman, Adair, who, with considerable erudition, has shown the affinity which exists between the manners of the ancient Hebrews and of the people of Florida and the Carolinas.^d These affinities prove, in general, merely a communication with Asia; and some of them, such as the use of the exclamation *Hallelu yah*, appear to be illusory. The Egyptians have been assigned as the ancestors of the Mexicans, by the learned Huet,^e by Athanasius Kircher, and by an American of erudition, whose vast researches have not been given to the world.^f The astronomical and chronological systems are totally different. The styles of architecture and of sculpture may resemble one another among many nations; and the pyramids of Anahuac bear a closer comparison with those of Indo-China than of Egypt. The Canaanites have been put in requisition by Gomara, in consequence of the feeble analogy with their customs that has been observed in Terra Firma.^g Many writers have maintained the reality of the expeditions of the Carthaginians into America; and we cannot absolutely deny the possibility of such an event.^h We are too little acquainted with the language of this celebrated people, a mixed race of Asiatics and Africans, to assume the privilege of deciding that no trace of an invasion of the Carthaginians really does exist. With a greater degree of certainty we can exclude the Celts, notwithstanding the etymological dexterity made use of to discover Celtic roots in the Algonquin.ⁱ The ancient Spaniards have also very feeble claims; their navigation was exceedingly limited. The Scandinavians have preserved historical documents, which establish the fact of their voyages to Greenland;^k but they do not go farther back than the tenth century, and merely prove that America was already completely peopled—a very powerful ar-

gument in favour of the high antiquity of the American nations. The celebrated Hugo Grotius^l has very awkwardly combined this historical fact with some conjectural etymologies, for the purpose of deriving the population of North America from the Norwegians, who, except in Iceland and Greenland, have left only faint traces behind them in the west.

The purely Asiatic origin of the Americans has met with numerous supporters. The learned philologist Brerewood,^m was, perhaps, the first by whom it was proposed. By the Spanish historians it was only partially admitted.

De Guignes,ⁿ and Sir William Jones,^o conduct into the New World, without much difficulty, the one his Huns and Thibetans, the other his Hindoos. *Fornicl*, whose work we have not been able to consult, was the first to insist on the Japanese being brought forward, who, it is true, may in reality lay claim to a great number of American words. *Forster* has attached a great deal of importance to the dispersion of a Chinese fleet, an event of too recent a date to have produced any great influence upon the population of America.^p

For half a century, the passage of the Asiatics by Bering's Straits, has been raised to the rank of an historical probability by the researches of Fisher, Smith Barton, Vater, and Alexander Humboldt. Yet these learned men have never maintained that all the Americans were descendants of Asiatic colonies.

An intermediate opinion, which unites the pretensions of the Europeans, Asiatics, Africans, and even the South Sea Islanders, has received the sanction of some writers of considerable weight. Acosta^q and Clavigero^r appear as its supporters. The latter insists, with reason, on the high antiquity of the American nations. The indefatigable philologist, Hervas,^s also admits the hypothesis of their mixed origin. It has been learnedly discussed by George Horn.^t This ingenious writer excludes from the population of America the negroes, of whom no indigenous tribe has been discovered in the New World; the Celts, Germans, and Scandinavians, because, amongst the Americans, neither light hair nor blue eyes are to be met with; the Greeks, and Romans, and their subjects, on account of their timidity as navigators; and the Hindoos, because the mythologies of the Americans contain no traces of the dogma of the transmigration of souls. He then deduces the primitive origin of the Americans from the Huns, and Cathayan Tartars. Their migration appears to him to be very ancient. Some Phœnicians and Carthaginians must have been thrown on the eastern coast of the new continent. Still later, the Chinese conveyed themselves thither. Fa-four, king of southern China, he contends, fled thither, to escape the yoke of Kublai Khan; and was followed by many hundred thousand of his subjects. Manco-Capac was also a Chinese prince. This system—a mere tissue

of conjecture when it first appeared, sufficiently harmonises with the facts that have been subsequently observed, and which we have above collected together. Some bold and unhesitating writer has only to seize on these facts, combine them with the hypotheses of Horn, and thus favour the world with the true and authentic history of the Americans.

It is not improbable that, at some future day, America, in the height of her civilization, may in her turn boast that she is the cradle of the human race. Already, two learned individuals of the United States have maintained, that the tribes of the north of Asia may just as readily be descendants of the Americans, as the latter of them.^a

In the present state of our knowledge, the wise will stop short at the probabilities which we have pointed out, without vainly endeavouring to combine them into a system.

N. B.—When the first edition of this work was published in 1817, we were still unacquainted with that volume of *Mithridates*, (Berlin, 1812, Part III. § 23.) which contains the admirable discourse of M. Vater on the languages of America. The interruption of our communications with Germany, prevented us even from knowing that it had appeared. The results of the researches of M. Vater, agree in the most essential points with our own; only he has attended less to the geographical connexions upon which the following table is founded. But his labours furnish many additional arguments in favour of our conjectures, though we cannot properly afford them a place in a system of Universal Geography. Whoever wishes to prosecute the subject farther, will find ample information in the above and the succeeding volume (1817) of *Mithridates*. M. Vater has carefully collected tables of analogous words in the languages of the old and new world. Between the American, Coptic, and Japanese (8); the Malay (11); the Sanscrit (5); the west coast of Africa (20); the Basque (8); the Celtic (19); and the Caucasian languages (9), he points out many similarities. He also demonstrates by a table, the connexion of the Greenlandish and Tehuktchese (26); and in another, the connexion of the Northern Asiatic with the American dialects in general.—The figures in brackets, indicate the number of analogies given for each. Upon the whole, he thinks it a demonstrable fact, “that in the north-eastern parts of America, in Greenland, and on the coast of Labrador; as also to the west of it, as in the vicinity of the Asiatic coast, there dwells a people which is one and the same race with the inhabitants of the north-east coast of Asia, and of the islands lying between the two hemispheres.”—Part III. page 339.

^a Bernard Romans' Natural History of Florida; New-York, 1776. Jefferson's Notes on Virginia, p 162.

^b All the American words are taken from the works, already quoted, of Messrs. Smith Barton, and Vater. The latter has taken them from a great number of printed or manuscript dictionaries. Some had been communicated to him by M. A. de Humboldt.

In these names we have corrected the Spanish and English orthography only as far as was necessary to render the analogy evident. (The French orthography of the author is retained in the translation.)

The connexions that were commenced by Messrs. S. Barton and Vater, and which we have not been able to complete, we have marked with the initials of those learned gentlemen's names. Sometimes, also, we have indicated by points those very remarkable gaps in the connexion of words, whose affinity, however, is indisputable.

The words of the Aleutian Islands, and of the island of Kadjak (Kodiak,) are taken from the vocabularies given by Sauer, in his account of Billings' Voyage.

The Kamtchadale, Yukagir, and Yakut words, are from the same source. The Tunguse, from Sauer, Georgi, &c. The Mantchoo words were communicated to us by M. Julius Von Klapproth. The Jesso or Aino words are taken from a manuscript vocabulary of M. Titsingh. The Japanese words are also from a vocabulary by the same gentleman, in the Memoirs of the Society of Batavia.

The Lieukieu and Birman words are from vocabularies published by M. Klapproth, in his Asiatic Memoirs.

- The sun*, in New-England, *kone*; in Yakut, *kouini*; in Ougour, *kien*; in Tartar, *koun*; in Awar, or Chunsag, *kko*. Also, in Tartar, *kouyach*; in Kamtchadale, *koua-atch*; in Maypure, *gouie*. In Wogul, *konzai*, the stars; in Ostiak, *kos*.
2. *The sun*, in Chiquito, *souous*; in Mosca, *soua*; in Yakut, *solous*, star; in Mantchoo, *choun*, sun; in Ostiak, *siouma*; in Tehuktchi, *synn*, stars; in Andi, *souvou*; in Wogul, *sowa*, star.—In Sanscrit, *sourya*; in Zend, *shour*.^c
3. *Idem*, in Quichua, *inti*; in Lulean, *inni*; in Aleutian, *in kak*, (the firmament;) in the Tunguse of Okhotsk, *ining*, (day.) In Low Javanese, *ginni*, fire; in Batta, *Iviang*, (God.)
4. *Idem*, in Chippeway, *kesis*; in Mahicanne, *keeschog*; in Tcheremisse, *ketsche* (S. B.)
5. *Idem*, *Nii*, and *néé*, the sun, in Kinai (Russian America,) connects itself with *ne*, day, light, in Birman; *nie*, eye, in Lieukieu; *ne*, eye, in Chilian; *néoga*, eye, or eyes, in Abipon.
- The moon*, in Aztec, *mextli*;^d in Afghan, *maishta*; in Russian, *msiaitsch*; in Awar, *moz*; in Sanscrit, *masi*.
2. *Idem*, in Chili, *couyen*; in Mossa, *cohe*; in Jesso, or Aino, *kounetsou*, (with the article affixed;) in Yukagir, *konincha*; in Esthonian, *kouli*; in Finnish, *koun*.
- The stars*, in Huastec, *ot*; in Tartar, *oda*, (V.)^e
- Idem*, in Chickasaw, *phoutckik*; in Japanese, *fouschi*.
- Idem*, in Algonquin and Chippeway, *alank*; in Kotowze, *alagan*; in Assani, *alak*, (S. B.)
- Heaven*, in Huastec, *tiab*; in Poconchi, *taxab*.....^f in Chinese, *tien*; and, in the dialect of Fo-kien, *tchio*.....; in Georgian, *tcha*; in Finnish, *taïwas*; in Esthonian, *taéwas*; in Courlandish and Pruczian, *debbes*, or *tebbes*; in Lettish and Livonian, *debbesis*.
- The earth*, in Chili, *toue*; in the Friendly Islands, *tougoutou*; in Tagalian, *touna*; in Aino, *toui*; in Japanese and Chinese, *ti*; in Tehukasse, *tchi*.
- Second connexion by the north: in Tunguse, *tor*; in Kittawin, *to*; in Abasgian, or Awchase,^g *toula*; in Altikesek, *tzoula*.
2. *Idem*, in Delaware, *hacki*; in Narraganset, *auke*; in Persian, *chaki*; in Bucharian, *chak*, (S. B.); in Aleutian, *tchekak*; in Kamatchinze, Karagasse, &c. *dscha*.
3. *Idem*, in Peruvian, *lacta*; in Yucatan, *lououn*, (S. B. and V.); in Yukagir, *lévié* and *lifié*, (in the ablative, *leviang*;) in the Finnish of Olonetz, *leiwou*; in Inguschi and Tehetchenghi, *laite*; in Birman, *lai*, country (*campagne*;) in Mexican, *tlali*; in Koliousche, *tlatka*.
4. *Idem*, in Tamanac, *nono*; in Zamuca, *noumi*; in Tchuktchi and Greenlandish, *nouna*, *nounit*; in Koriak, *noutæ-lout*.

The Sanscrit and Malay words, &c. are borrowed from the *Mithridates*. The high and low Javanese, from the Memoirs of Batavia. The Polynesian, from Cook, Entrecasteaux, &c. The Ougour and Afghan words, and those of the Caucasian tribes, the Andi, Awar or Chunsag, Kabutsch, Kasikumuk, &c. &c. from the Memoirs of M. Klapproth.

The Wogul, Ostiak, Permian, and Finnish words, are taken from Vater, Smith Barton, and the *Mithridates*. The Lithuanian, Courlandish, and Pruczian, (or old Prussian,) from a manuscript vocabulary.

^c We may class together with the above the *sounna* of the Goths and Germans,^g the *sol* of the Latins and of the Manni, or Scandinavi ans, anterior to the Goths, (vid. Edda Sæmundina, Alvismål, Strophe 16,) and the *saulous* of the Lithuanians.

^d *Tli* is only a common termination in Mexican, or Aztec.

^e According to what the learned M. Klapproth has informed us, M. Vater ought to be thus corrected: in Mongol', *od-n*. The name of fire, *ot*, in Ouigonie (Ougour?) *od*, in Tartar, may be also connected with the preceding.

^f This immense blank has offered us only one single analogous word, *tiba*, rain, in Yukagir. The resemblance is the more accurate, as *tebbes*, and *debbes*, in the Lithuanian languages, mean the sky, clouds.

^g Abassian or Abklas, a language spoken at the western extremity of Caucasus.—P.

* Germ. *sonne*, Belg. *son*, Eng. *sun*, Dan. *soel*.—P.

Fire, in Brazilian, *tata*; in Muscogulge, *toutkah*; in Ostiak, *tout*; in Wogul, *tat*, (S. B.); in some Caucasian dialects, *tzah*; in Mantchoo, *toua*; in Finnish, *touli*.

Water, in Delaware, *mbi* and *beh*; in Samoiede, *bi* and *bé*; in Kurilian, *pi*, (S. B.); in Tunguse, *bi-alga*, the waves; in Mantchoo, *bira*, river; in Albanian and Epirotic, *oui* and *vie*.

2. *Idem*, in Mexican, *ael*; in Wogul, *agel*, (S. B.)^a

3. *Idem*, in Vilela, *ma*; at Norton-Sound, *moose*; in Tchuk-tchi, *mok*; in Tunguse, *mou*; in Mantchoo, *mouke*; in Japanese, *mys*; in Lieukieu, *minzou*.^b

4. *Idem*, in Tamanae, *nono*; in Zamuca, *noumi*; in Tchuk-tchi and Greenlandish, *nouna*, *nounit*; in Koriak, *noutelout*.

Rain, in Brazilian, *ameu*; in Japanese, *amé*, (S. B.)

Idem, in Algonquin, *kemevan*; in Lesghian, *kema*, (Id.)

Wind, in Vilela, *uo*; in Omagua, *ehuétu*; in Ostiak, *vot* and *uat*, (V.)

It may be looked upon as approaching *wad*, wind, in Pehlvi; *waihou*, Sanscrit; *wiatr*, Slavonic; *vetr*, Icelandic; *vavouhr* and *hvituhth*, in two dialects of Scandinavia, now lost.^{c d}

Air, in Delaware, *awonou*; in Miami, *awaunweeh*; in Kirghis and Arabic, *awa*, (S. B.); in Sanscrit, *avi*.—In Iotic, a dialect of Scandinavia, *api*.^e

Year, in Peruvian, *huata*; in a Tchuk-tchi dialect, *hiout*; in Ostiak, *hoet* (S. B.); in Albanian, *viet*; in Lieukieu, *wadii*, month.—In Hindostanee, *wakht*, time.^f

Mountain, in Araucanian, *pire*, (a particular name of the Andes).....In Yukagir, *pea*; in Ostiak, *pelle*; in Andi, a Caucasian dialect, *pil*.—In Sanscrit, *pura*. The *Pyrenees*.

Field, in Haytian, *conouco*; in Yakut, *chonou* (V.); in Japanese, *kouni*, a district.—In Chinese, *koue*, kingdom, region.

Height, in Acadian, *pandemou*; in Mordwin, *pando*; in Mok-schan, *panda* (S. B.); in Yukagir, *podannie*, high, elevated.

Bank, in Ottoman, *cahti*; in Yakut, *kitto*; in Laplandish, *kadde*; in Aino, *kada-schma-kodan*, an inclined bank.

Sea, in Araucanian, *languen*; in Tunguse, *lam*; in Malay, *laout*.....In the Edda-Sæmundina, *la* and *lagi*.^g

Lake, in Hungarian, *to*, and *ferto*; in Aino, *to*, a great lake; in Tchuk-tchi, *toutou-touga*, a gulf of the sea; in Mexican, *atoyatl*, lake; in Lule, *tooson*.

River, in Greenlandish, *kook*; in Tchuk-tchi, *kiouk*; in Kamtchadale, *kiigh*; in Samoiede, *kyghe* (V.); in Southern Chinese, *kiang*; in Kinaitzi, *kytnu*.

2. *Idem*, in Natchez and Algonquin, *missi*, or *messé*, (Missisipi, Miss-Ouri, Missi-Nipi, &c. &c.) in Japanese, *mys*, water; in Lieukieu, *minzou*.

Tree, in Mossa, *ioukhoukhi*; in Ostiak, *ioukh* (V.); in Yukagir, *kiokh*, plant.

Wood, in Chippeway, *mittic*; in Samoiede, *mide* (S. B.)

Forest, in Nadowessi, *ochau*; in Zamuca, *ogat*; in Tartar, *agaz* (V.); in Kadjak, *kobogak*, a tree; in Afghan, *oha*,^h (see grass.)

2. *Idem*, in Ottoman, *tæhe*; in Delaware, *tachan*, or *tauhon* (V.); in Yakut, *tya*; in Japanese, *tiitini*, wood.—In Mongol, *taëri*, pine.—In the Friendly Islands, *tohou*, a species of tree.

3. *Idem*, in Guarani, *caa*; in Tupi, *cagua*; in Omagua, *cava*; in Vilela, *cokuit*; in Maya, *k'aas*; in Malabar, *kadd*. All these words are related to the word for grass, second series.

Bark, in Quichua, *cara*; in Ostiak, *kar*; in Tartar, *kaëri*; in Perman and Slavonic, *kora*; in the Finnish of Olonetz, *kor* (V.)

Stone, rock, in Carib, *tebou*; in Tamacian, *tepou*; in Galibi, *tobou*; in Koliouche, *te*, or *tete*; in Yaoi, *tabou*; in Les-

ghian, *teb*.—In Aztec, *tepell*, mountain, rock; in Turkish, *tepe*; in Mongol, *tabakhan*, point of a rock.

Grass, in Chiquito, *boos*; in Mongol, *oubousu*; in Kalmuk, *æbæsyn* (V.).—In Yakut, *bosok*, a branch.—In Kadjak, *obovit*, plants.—In the Friendly Islands, *bougo*, tree, (see forest, first series.)

Idem, in Omagua, *ca*; in Guaicure, *caa*; in Hindostanee, *gas*; in Kamtchadale, *kakain*, the juniper bush.—In Birman, *â-khâ*, a branch of a tree.

Fish, in Quichua and Chili, *khalloua*; in Cochimi, *cahal*; in Maya, *caih*; in Poconehi, *car*; in Kadjak, *kakhlucuit*; in Koliouche, *chaat*; in a Tchuk-tchi dialect, *ikahluk*; in Jesso, *kara-sacki*, (salmon); in Samoiede, *koual*, and *karre*; in Wogul and Ostiak, *khoul*; in Koibale, *kholla*; in the Finnish of Carelia, *kala*; in Tonquinese, *ca*.

Idem, in Mobima, *bilau*; in Yakut, *balyk*; in Tartar, *baluk*; in Russian, *belouga*.

Bird, in Tamacian, *toreno*; in Japanese, *tori* (V.).—In Hindostanee, *tchouri*.

Goose, in Chippeway, *gah*; in Chinese, *gouhi* (V.).—In Japanese, *gang*.^k—In Mantchoo, *gaskhan*, bird.

Bread, in Chickasaw, *kawtoo*; in Wokkonsi, *ikketau*; in the Ostiak of Pumpokol, *koita*; in Akuscha and Kubescha, *katz*; in Pruczian, *ghicytie*.

Nourishment, in Quichua, *micunnan*; in Otaheitian, and in the Friendly Islands, *maa*; in Asiatic Malay, *macannan*; in Japanese, *mokhi*.....;^l in Inguschi, in Tuscheti, *mak*, bread, or cake; in Altikesek, *mikel*.

Meat, in Mexican, *nacatl*; in Greenlandish, *nekke*; in Tchuk-tchi, *nakka*; in Japanese, *niekf*.....^m

Bone, in Tuscarora, *ohskhêreh*; in Armenian, *oskor*.—*Idem*, in Creek, *ifoni*; in Japanese, *fone* (S. B.)

Blood, in Totonac, *lacañi*; in Tarahumar, *laca*; in Yukagir, *liopkol*; in Hindostanee, *lohou*.

Pig, in Tarahumar, *cotschi*,ⁿ in Chippeway, *cocootsche*; in Mongol, *khokhai*; in Cathayan, *khai*.^o

Dog, in Carib, *caicoutchi*; in Tarahumar, *cocotschi*; in Kamtchadale, *kossa*; in Kasikumuk, *ketschi*.—*Idem*, in Cherokee, *keira*; in Ostiak, *koira*.—*Idem*, in Andi, Awar, and other Caucasian idioms, *khoi*; in Birman, *khoui*; in Aleutian, *ouikouk*.

Boat, in Galibi, *canoua*; in Haytian, *canoa*; in Aino, according to La Peyrouse, *kahani*; in Greenlandish, *cayac*; in Russian America, *the same*; in Samoiede, *cayouc*; (*kahn*, in German, *canoe*, Eng. *canot*, Fr.)

House, in Mexican, *calli*.....; in Wogul, *kol* and *kolla*; in the German and Scandinavian languages, *hall*.

Idem, in Lulean, *ouya*; in Aleutian, *ouladok*; in Ouigour, *ouyon*; in Tartar, *oui*.—*Idem*, in Chickasaw, *chookka*; in Kadjak, *cheklicuit*; in Japanese, *choukoutche*.

Man, in Araucanian, *auca*; in Saliva, *cocco*; in Koliouche, *ka* and *akkoeh*; in Jesso, *okkai*; in Yakut, *ôgo* (boy)..... in Guarani, *aca*, head.

Idem, in Acadian, *kessona*; in Ostiak, *kassek*; in Kirghis, *kese*; in Yakut, *kisi*; (S. B.)—In Yakut, *kissæ*, man; *kisa*, virgin, &c.; in Ouigour, *kiischou*.

Woman, in Saliva, *nacou*; in Penobscot, *neeseewoek*; in Pot-tawattami, *neowah*; in Tchuk-tchi, *newem*, woman in general, *newaitchit*, young woman, girl; in Samoiede, *neu*; in Ostiak and Wogul, *ne*; in Mordwin, *netscha*; in Akuscha, *netsch*; in Kubascha, *nem*; in Polonese, *niewiasta*.—In Zend, *naeré*; in Pehlvi, *naerik*.—In Hebrew, *nekebah*.

^a These words appear inaccurate. They ought to be, in Mexican, *atl*; in Wogul, *atil*; the great river, *aqua*, *ua*, *ark*, &c. &c.

^b M. Vater discovers these American words in the *movi* of the Copts, and in the Mauritanian *ma*. The resemblance is perfect; but, we ought to be told what M. Vater understands by Mauritanian. As to the Copt, it has received many words from the Asiatic languages.

^c Dan *veir*, Germ. *wetter*, Belg. *weder*, Eng. *weather*.—P.

^d Edda Sæmundina, t. I. p. 264. Alvismál, Strophe 20.

^e *Ibid*, p. 265. The Iotes were anterior to the Goths. They were giants,—the Anakim, the Patagonians of the north.

^f The root of all these words appears to be Arabic.

^g See the register of words in the Edda Sæmundina. The word also signifies all fluids in general. *Liquor*, *liquidus*.

^h Many of these words approach to the *eiche* of the Germans, and the *oak* of the English.

ⁱ Russ. *gous*, Dan. *gaus*, Eng. *goose*.—P.

^k Germ. *gans*, Eng. *gander*, L. *anser*. The resemblance in this and the preceding note is not a little remarkable, even in the last example, which differs only in wanting the initial guttural.—P.

^l This gap in the chain, on the northern side, naturally arises from the northern hordes being ignorant of the use of bread, and of aliments prepared by art.

^m The corresponding words, in all the intermediate languages, differ altogether from these. The same remark is applicable to the next word.

ⁿ L. *os*.

^o Fr. *cochon*.

^p Ulagh-Bei, Epochæ Cathaïorum, ed. grav. p. 6. Klaproth. Mines, d'orient.

2. In Mahacanni, *weewon*; in the Caroline and Friendly Islands, *wefaine*; in Low Javanese, *aweewe*.^a
Father, in Mexican, *tatli*; in Moxa, *tata*; in Otomite, *tah*; in Poconchi, *tat*; in Tuscarora, *ata*; in Greenlandish, *atat*; in Kadjak, *attaga*; in Aleutian, *athan*; in Tehuktchi, *atta* and *attaka*; in Kinai, *tadak*; in Turkish and Tartar, *atta*; in Japanese, *tete*; in Sanscrit, *tada*; in the Finnish of Carelia, *tato*; in Wallachian, *tat*.^b

2. *Idem*, in Lulean, *pe*; in Koriak, *pepe* (V.).—In Jesso, *fanne*; in Birman, *pha*; in Siamese, *po*; in Sanscrit, *pida*.^c

3. *Idem*, in Vilela, *op*; in Kotowzi and Assanian, *op* (V.).^d

4. *Idem*, in Quichua, *yaya*; in Yakut, *aya*; in Chiquito, *iyai*; in Shebay, *haia*; in Eslène (Escelen), *ahai* (V.).—In Aleutian, *athau*; in Yakut, *agam*, or *ayam*; in Votiak, *ai*; in Permian and Sirjanian, *aie*.

Mother, in Vilela, *nane*; in Maypure, *ina*; in Cochimi, *nada*; in Mexican, *nantli*; in Pottawattami, *nana*; in Tuscarora, *anah*; in Pennsylvania, *anna*; in Greenlandish, *ananak*; in Kadjak, *anagah*; in Kinai, *anna*; in Aleutian, *anaan*; in Kamtchadale, *naskh*; in Tunguse, *anee*; in Yukagir, *ania*; in Tartar, *anakai* and *ana*; in Inguschi, *nana*.

Son, in Vilela, *inake*, (son and daughter); in two Tehuktchi dialects, *iegnika* and *rinaka*; in Tagalian and Malay, *anak*. The other intermediate links are wanting.

2. In Carib, *kachi*; in Teheremisse, *keschi* (S. B.).—In Yakut, *kisim*, daughter; in Kinai, *kisna*, *kissun*, daughter; *kissikoa*, little girl. These words are connected with those for *man*, second series.

3. *Idem*, in Penobscot, *namon*; in Samoiede, *niama* (S. B.).^e

4. *Idem*, in Maypure, *anis*; in Algonquin and Chippeway, *ianis* (V.) in Yukagir, *antou*.

Brother, in Araucanian, *penni*; in Quichua, *pana*; (in Kadjak, *pani-goga*, daughter; in Tehuktchi, *panika*, daughter; in Yukagir, *pa-outch*, sister;) in Lieukieu, *sien-pin*, eldest brother; in Hindostanee, *bein*, sister; in Zingari, *pæn*, *idem*.^f

2. *Idem*, in Chippeway, *onnis*; in Algonquin, *anicñ*; in Japanese, *ani*, eldest brother; *ané*, eldest sister.

3. *Idem*, in Quichua, *huaquey*; in Tunguse, *aki* (V.).—In Mantchoo, *ago*; in Tartar, *agha*; in Ouigour, *aká*; in Tehuktchi, *aki*, younger brother; in Koliouche, *achaik* and *achaica*, brother, (*achkik*, sister;) in Kinai, *agala*, elder brother.

Sister, in Onondaga, *akzia*; in Jesso, *zia*, elder sister; in Yakut, *agassim*; in Lesghian, *akiessio*.

Child, in Quichua, *huahua*; in Omagua, *idem*; in Yukagir, *oua*; in Awar, *uassa*, and *uas*; in Wogul, *uassum*.

Head, in Guarani, *aca*; in Omagua, *iaca*; in Yukagir, *yok*.

Eye, in Abipon, *neoga*; in Mocobi, *nicota*; in Cubaya, *ni-gue*; in Peruvian, *nahui*; in Kinaitzi, *nagak*; in Chili, *ne*; in Catawba, *neetouth*; in Kamtchadale, *nanit*; in Lieukieu, *nie*; (in Boman or Birman, *ne*, day, light;) in Teheckasse, *ne*; in Mongol, *nitoun*; in Kalmuck, *nidoun*;—In High Javanese, *netra*.

Idem, in Mahicanni, *keesq*; in Seneca, *kakaa*; in Russian America, *kavak*; in Yakut, *kasak*; in Tartar, *kys*; in Ouigour, *kus*.

The throat, in Yukatan, *cal*; in Kalmuck, *chol*; in Esthonian, *kael*, (throat and neck,) (V.).—In Yakut, *kelga*.—In Awar, *kal*, mouth; in Afghan, *chule*.^h

Tongue, in Quichua, *kalli*; in Mongol and Kalmuck, *kelen* and *kyle*; in Permian *kil*; in Esthonian, *keli*; in the Finnish of Carelia, *kelli* (V.).

Tooth, in Chippeway, *tibbit*; in Ostiak, *tibu* and *tewa*; in Samoiede, *tibbe*; in Awar, *ziw*, *zib*, *zabi*; in Birman, *tabu*.

Hand, in Chili, *kou*;..... at Nootka-Sound, *coucou*;.....ⁱ in Ouigour, *kol*; in Kasikumuk, *kuæ*; in Awar, *kuer*; in Kabutsch, *koda*.

Idem, in Delaware, *naschk*; in Akuscha, *nak*.—(S. B.).—In Yukagir, *nogan*.

Ear, in Chili, *pilin*; in Ostiak and Samoiede, *pil*; (S. B. and V.) The intermediate words are unknown.

Belly, in Chili, *pue*; in Votiak, *put* (S. B.) The known intermediate terms differ. Among the Battas of Sumatra, we find *boutoua*; *idem*, in Andi, *bubit*; *idem*, in Hindostanee, *pitch*.

Idem, in Delaware, *wachtey*; in the Finnish of Olonetz, *wat-scho* (S. B.)

Foot, in Tuscarora, *auchsee*; in Kamtchadale, *tchou-atchou* in Yakut, *atauch*; in Japanese, *aksi* and *atschi*; in Ouigour, *ajak*.

Idem, in Carib, *nougouti*; in Miami, *necahtei*; in Yukagir, *noel*; in Samoiede, *nghé*.

Forehead, in Pennsylvania, *hakalu*; in Tuschi (Caucasian) *haka* (S. B.).—In Dido (Caucasian) *haku*, mouth.

Beard, in Tarahumar, *etschagouala*; in Tartar, *sagal*; in Kalmuck, *sachyl* (V.).—In Ouigour, *ssachal*.

Black, in Chili, *couri*; in Aino, *kouni*; in Toukin, *koro*; in Kasikumuk, *chourei*, (night).^k

White, in Lulean, *pop*; in Vilela, *pop*; in Chiquito, *pouroi-bi*; in Zamuca, *pororo*; in Yukagir, *poinnei*.

Idem, in Yucatan, *zac*; in Totonac, *zacaca*; in Mongol, *zagau* (V.)

Red, in Mexican, *costic*; in Kiriri, *koutzou*; in Kadjak, *kou-ightoak*.—In Japanese, *koutsou*, fine, brilliant.

Name, in Greenlandish, *attack*; in Tartar, *at*.—*Idem*, among the Carib women, *nire*; in Mongol, *nyre*; (V.) in Kadjak, *atka*; in Aleutian, *asia*; in Yakut, *aatta*.

Love, in Quichua, *munay*; in Sanscrit, *manya* (V.).—In Teutonic, *minne*; but the intermediate words are wanting.

Pain, in Quichua, *nanay*; in Otomac, *nany*; in Tunguse, *ænan* (V.).—In Aleutian, *nanalik*.

God, in Quichua, *pacha-camac*; in Japanese, *kammi*, (*kham*, in Sanscrit, Malabar, and Multanian, the sun.)

Idem, in Aztec, *teo*; in Sanscrit, *deva*; in Zend, *div* and *dev*, in Greek, *theos*; in Latin, *deus*. [Irish, *dia*.]

Lord, or *Prince*, in Araucanian, *toqui*, from the verb *toquin*, to command; in Aleutian, *tokok*; at Atchem (Acheen,) in Sumatra, *tokko*.

To eat, in Cora, *cua*; in Tarahumar, *coa*; in Mexican, *qua*; in Alconte, *kaangen*, (Eat, imperat.) in Japanese, *cwa*.—In German, *kauen*, to *chew*.

I, pronoun, in Delaware, *ni*; in Tarahumar, *ne*; in Mexican, *nehuatl*; in Moture, *ne* (S. B.).—*Idem*, in Guaicure, *am*; in Abipon, *aym*; in Wogul, *am*.—In Waicure, *te*; in Mongol, Tunguse, and Mantchoo, *bi* (V.)

Idem, in Wyandot, *dee*; in Mixtec, *di*; in Andi (Caucasian) *den*; in Awar, *dida*, I myself.

Idem, in Lulean, *quis*; in Totonac, *quit*; in Kadjak, *khoui*; in Aleutian, *kien*; in Kamtchadale, *komma*, I; *kis*, thou; in Lamut-Tunguse, *kie*, I and me; *kou*, thou.

Idem, in Nadowessian, *meo*; in Yakut, *min*; in Yukagir, *matat*; in Finnish and Laplandish, *miya*.

Thou, pronoun, in Huastec, *tata*; in Yukagir, *tat*; in Mexican, *te-huatl*; in Siriaie, *te* (V.)

He, pronoun, in Tarahumar, *iche*; in Huastec, *jaja*; in Mexican, *yehuatl*; in Tagalian and Malay, *iya* (V.)

We and *You*, in Mocobi, *ocom* and *ocomigi*; in Guaicure, *oco* and *acami diguagi*; in Abipon, *akam* and *akamyi*; in Malay, *camy* and *kamy*; in Tagalian, *camon* and *camo* (V.)

^a This word corresponds rather with the Madagascar *vaiuolé*. The Malays have come from Madagascar to America, by following the direction of the winds and currents.

^b Basque, *aïta*; Irish, *athair*; Gothic, *atta*; Frisic, *haita*; Hungarian, *atya*; Albanian, *atta*, *tata*; Welsh, *tad*; Kisti (Caucasian) *dada*; Akuscha (Caucasian) *dudesch*.—P.

^c L. *papa*; Grison, *bab*; Tartar, *baba*; Curdish, *babar*; Zend, *pete*; Persian, *peder*; Gr., Lat. *pater*; G. *vater*; Saxon, *fader*.—P.

^d Shemitic, *ab*; Birman, *apa*; Koriak, *appa*; Ostiak, *obo*.—P.

^e We may approximate to this *nulma*, man, male, in Mantchoo.

^f This connexion will not appear forced to those who are aware how much names, that express family connexions, are confounded together.

^g Pronounced *hhouahhoua*. It is possible that the resemblance is owing to a mere onomatopœia.

^h Germ. *kehle*, Belgic, *keel*, the throat, Fr. *gucule* L. *gula*.—P.

ⁱ The words of the languages comprised within the two gaps are completely different.

^k The *Tou-Kins* were a horde to the north of China. The word *koro* answers to the Tartar *kara*, as well as several other Teu-Kin words. The Chinese made from it *holo*. Perhaps *coca*, black, in Ay-mar, and *couyoné*, night, in Tarahumar, may have sprung from the same root.

Yes, in Galibi, *teré*; in Samoiede, *terem* (V.)—In Ottomac, *haa*; at Nootka-Sound, *ai*; in Kadjak and Aleutian, *aang*; in the Sandwich Islands, *ai*; in Yakut, *ak*; in Ostiak and Aleutian, *aa*; in Mexican, *yve*; in Miami, *iyé*; in Jotonek, *ya*; in Tunguse, *ya*; in Aleutian, *je*; in Finnish, &c. &c. *ya*.
One, in Mexican, *ce*; in Jesso, *zen-etsoub*; in Kabardian, *ze*; in Awar, *zo*.
Idem, in Laymon, *tejoc*; in Betoï, *edojojoi*; in Japanese, *itjido*, once; in Birman, *thit*; in Lieukieu, *tids* or *idshi*.
Two, in Pima, *kok*; in Yakut, *iké*; in Awar, *ké*; in Permian, *kik*; in Esthonian, *kaks*.

NOTE.—M. Vater has discovered thirty-one analogies between words in the languages of America and Europe. Out of this number, however, thirteen are derived from the Finnish languages, and naturally belong, as well as those from Scandinavia, to the chain of idioms of the north of Asia. Others are founded on error; for instance, *yztic*, cold, in Mexican, bears no affinity with the Basque *otza*, but with the Scandinavian *iis*, to the Ostiak *jech*, &c. &c.

The same learned gentleman has pointed out thirty-three analogies between American and African idioms. He might have added the following:—

Sun, *veiou*, in Galibi; *weye*, in Yaoï.—*Ouwia*, on the Gold-coast; *eiwian*, in Amina; *ouai*, in Watie.

Hand, *is*, in Lulean; *isunga*, in Koussa; *ulegh*, in Barabra.

It seems to us, that these words, being found in South America, in the vicinity of the Malay words, indicate the arrival of a colony of Malays, mixed with inhabitants of Madagascar and Caffres.

We have discovered in the vocabularies of Nigritia, recently published, several new analogies; but they do not seem to promise much, though it is our intention to prosecute the inquiry still further.

N. B. The reader will please to observe, that the analogical words of the above table are retained in the French orthography, into which they have been translated by M. Malte-Brun; it being impossible to discover what allowances he may have made, or what rules he may have followed, in adapting them to the orthoëpy of that language.—ED.

BOOK LXXVI.

AMERICA.

Description of America.—Researches concerning the navigation of the Icy Sea of the North.—North-west coast of America.

THE extremities of America towards the north, the north-west, and the north-east, come now to engage our attention. These regions, however, which may be termed "American Siberia," even after the recent voyages of Ross, Parry, Franklin, and Kotzebue, still continue in a great measure unknown. We are ignorant, for instance, whether the waters seen by Mackenzie and Hearne, are lakes, or gulfs, or a part of the Icy sea. The itinerary of Hearne, properly estimated, and adjusted to the true points of the compass, would, in my opinion, conduct us nearly a hundred leagues more to the north-east, and probably to the shores of some lake or gulf connected with Baffin's Bay. Captain Franklin has brought the mouth of Mackenzie's^a River almost eight degrees to the east of its assigned position. The sea into which this and Copper-mine River fall, is salt, has tides, and is *believed* to communicate with the sea at Repulse Bay; but though coasted for more than 500 miles to the eastward, the point has not been ascertained. We are equally uncertain whether this sea be identical with that which washes Melville Island, the western limit of Parry's first voyage. On the whole, though the voyages of Ross, Franklin, and Parry, have brought the eastern and western shores of North America to within half of their former distance, the identity of the sea which washes *Cape Turnagain*, *Repulse Bay*, and *Melville Island*, is far from being established; and the question of its extension to Icy Cape, or what is called the North-west Passage, remains still to be investigated. The second voyage of Parry^b has added nothing to advance the solution of this question. The actual existence and limits of Baffin's Bay itself, called in question by an arrogant scepticism, which mistakes its own caprices for argument, have been established by the expeditions of Ross and Parry; but the discovery of Barrow's Straits, by the last of these navigators, has authorized the learned critic still to question, whether the coasts seen by the intrepid Baffin are continuous, or belong to a chain of islands. The openings bearing the name of Jones, Smith, Whale, Wolstenholme, have not been visited in detail, and in the bottom of one or more of these bays, straits might possibly still be discovered. The extent of Greenland to the north-west and north-east, has eluded the persevering researches of the Danish missionaries. All that is known is, that the Greenlanders, after passing a strait, have communicated with tribes of their own race to the north of Baffin's bay. It is still

undecided where a gulf or strait is terminated, which was discovered in 1761, upon the eastern coast of Greenland, by Volquart Boon, a Dane. On the other hand, the islands seen to the north of Cape Ceverovostochnoi in Siberia, the great coast of Ielmer in the same latitude, and the land of Liaikhof, have not been examined; nor do we know whether this land forms part of a continent, or if that continent is part of America. The immortal Cook, after having again explored Behring's Straits, very soon found his progress arrested by ice, which united the two continents. Sarytchew assures us that this ice never disappears, or, at least, that its disappearing is so extraordinary an occurrence, that it does not happen above once in a hundred years.^c This immoveable nature of the ice, the want of ebb and flow of the tide to the north of eastern Siberia, the light and variable winds, the comparative frequency of clear weather, the arrival in Siberia of troops of bears and foxes in a well-fed condition, which have traversed the Frozen Sea to the north of *Cape Tchalaginskoi*, all lead us to conclude, that the continent of America extends very far to the north, and actually forms, at the pole itself, a *third* great peninsula. The land discovered to the north of Siberia, by *Liachof*, and *Chwoïnof*, appears to be one extremity of America. The passage between this arctic land and Siberia, contains the celebrated islands, which are entirely composed of the bones of the rhinoceros and elephant, mixed with the remains of cetaceous animals—a mass of debris, that appears to have been accumulated by a current which no longer found any outlet. Perhaps even Greenland may be united with America, on the north-west side; while the coasts described by Baffin, may, in part, be only an archipelago, which leaves behind it an inland sea, similar to the Gulf of Mexico. It is even possible that many basins of the same kind may exist to the north and north-west of America. Not one of these questions has been resolved by the voyages of the intrepid Parry, in other respects so valuable.

Who, however, will dare to penetrate these frightful abodes of eternal winter; this gloomy region, where the sun sheds in vain his oblique rays on a soil doomed to perpetual barrenness; plains that are overspread with dreary moss, and valleys in which the echoes never repeat the warbling of even a solitary bird; these places, in fine, where nature sees her vivifying influence expire, and witnesses the awful termination of her vast empire?

We know not how far a traveller might penetrate by land, if, at once prudent and courageous, he were to provide against the freezing winds, and the want of provisions.

VOL. II.—NOS. 73 & 74.

^c Sarytchew's Voyage to the Icy Sea, v. i. p. 99. (In Russian.)

But nothing more can be hoped for from fresh attempts by sea, since Ross, Parry, Franklin, Cook, Billings, and Sarytchew, have confirmed the observations of Heemskerck, Wood, Mulgrave, Hudson, Jens Munk, Fox, and Baffin, who were every one of them arrested in their progress by either land or ice. Nevertheless, a contrary opinion has been suddenly revived, by the discovery of the account of a pretended voyage round the northern extremities of America, compiled by Maldonado Ferrer, which this impostor allèges that he himself performed in 1588. This memoir, discovered in the Ambrosian Library at Milan, and the publication of which is due to the zeal of the learned M. Amoretti, is addressed to the Royal Court of Lisbon, for the purpose of inducing that government to fit out an expedition, of which, no doubt, he himself hoped to have the command. It is composed of thirty-five paragraphs, of which the eight first detail the great commercial advantages of this new passage, and the necessity of occupying it by a military force. From the ninth to the thirty-third paragraph, information is given with regard both to the route, and his pretended voyage; and the two last contain the plan of an expedition which he affirms ought to be sent thither.^a

Without entering into a detail of the contradictions which result from an examination of Maldonado's calculations, and from comparing the two translations of the original Spanish published by M. Amoretti, the one in Italian, the other in French; we will merely remark that, in tracing his voyage on a modern chart, the first unknown part of the route passes through some pretended Straits of *Labrador*, 280 or 290 miles in length, which would occupy, throughout its whole extent, the land situated to the west of Davis's Straits and Baffin's Bay. The second comprehends a navigation of three hundred and fifty miles, *in an open sea*, descending from 75° of latitude, to 71° in the vicinity of Icy Cape, beyond which, neither Cook nor King could advance from the south. The third part of this voyage conducts him across a part of the actual continent of Asia, by what he calls the *Straits of Anian*; which, according to his bearings, ought to be looked for in Tartary, sixty miles to the west of Okhotsk. In the fourth, he stretches along the *coast of America*, which is there one continued *desert plain*: but, according to the charts, he must have traversed the Stannowoi mountains in the country of the Tunguses. Finally, in the fifth, he describes a great elevated coast, which, from its position, can be nothing else than that of Lake Baikal. Were it even possible to admit that Maldonado was mistaken in his longitude, and that his Straits of Anian are, in fact, what we are acquainted with under the name of Behring's or Cook's, the difficulties would still be the same; because, in that case, Maldonado must have crossed the Peninsula of Alaska, or at all events, must have passed through the midst of the Aleutian Islands, without being able to perceive them! Besides, Maldonado's Straits of Anian bear no resemblance whatever to those of Behring, being rather copied from those of Magellan. He pretends to have followed this route, which, according even to his own account, exceeds seven hundred geographical miles in length, twice in the course of one summer, without encountering ice, seals,

white bears, or any thing, in short, which is peculiar to the northern zone. But he tells us of a wall, above three feet high, composed of egg-shells, and speaks of beautiful trees, that retain their fruit the whole year; he found the *Litchis*,^b a Chinese fruit, the wild vine, and various kinds of game belonging to the temperate climates; and, more particularly, a species of hog with its navel on its back, and lobsters a foot and a half in length; nay, he actually affirms that he saw a *Russian* or *Hanseatic* vessel, of 800 tons, on its passage to Archangel!! These, with many others, are the marvellous stories which Maldonado relates. It is natural, therefore, to feel some curiosity respecting such a personage. Unfortunately, however, all that is known of him is reduced to two notes, the one an extract from the "Spanish Library"^c of N. Antonio, according to which, he was an old military officer, who was well acquainted with navigation and geography, and was the author of a work entitled the *Picture of the World*,^d and of a History of the discovery of the Straits of Anian. The other is extracted from the "Indian Library"^e of Antonio de Leon, from which it appears that Maldonado had drawn the council of the Indies into great expense, by the vain promise of inventing a compass that would not be subject to the inconvenience of the variation, and a method for finding the longitude at sea.

In the the thirtieth paragraph of his plan for the expedition, Maldonado says, that he was guided, during his voyage, by a good account written by Joam Martinez, a Portuguese pilot, and a native of Algarve, but of whom no one knows any thing. It appears probable, therefore, that this manufacturer of projects was in possession of some unknown accounts of the Portuguese voyages through Hudson's Straits, called the Straits of Anian by Cortereal. He no doubt combined these notions with some hints borrowed from the Japanese, respecting the sea of Okhotsk. Hence, this combination of positions, which it is impossible to admit, and this union of physical characters which belong to different climates.^f The relation of Maldonado, in short, is no longer any thing but a bibliographical curiosity. It was such stories as these which made Baffin say,^g after having explored with the greatest care, in 1615 and 1616, all the coasts of the sea which bears his name, "The Spaniards, a vain and jealous people, would never have ventured to publish so many false charts and imaginary journals, unless convinced of the existence of a north-west passage, they had been anxious to deprive of the glory of the discovery, that courageous individual who should be the first to pass it. As to myself, I was unable to renounce this opinion, so generally received, until I was persuaded of the absolute impossibility of finding what I had so ardently longed to discover."

This opinion of the pretended navigations of Maldonado Ferrer, seems to us to be still further confirmed by the late discoveries of Parry, since they do not coincide with those of Maldonado, either in regard to positions or physical details.

Let us then acknowledge with this navigator, and with all who possess any true knowledge, that the extent of America to the north is still unknown, and that no one has sailed round it on that side.

When we reflect on the nature of the icy sea, it is difficult to believe that navigators can ever explore its extent. Every where they have encountered fixed ice, which has arrested their progress; or moveable ice, which threatening to enclose them, has put all their courage to flight. Captain Wood, who firmly believed in the possibility of a northern passage, found his further progress stopped at 76° by a continent of ice, which united together Nova-Zembla, Spitzbergen, and Greenland. Captain Souter, on the contrary, in 1780, continued his course as far as 82° 6', in a smooth and open channel. The fixed ice, however, which formed the sides, beginning to be detached, he dreaded lest his return should be cut off, and, accordingly, abandoned the enterprise.^a Although the courageous Baffin, and a few others,^b have been able to make the circuit of the bay that bears his name, this sea has been generally found closed by masses of fixed ice, of a hundred German leagues in length, and containing mountains four hundred feet high.^c Perhaps, James' Island, marked in several charts, was a similar mass of ice. Captain Wafer frankly confesses that he mistook fixed ice, five hundred feet in height, for genuine islands.^d It often happens that this floating ice is found covered with large stones and trees, torn up by the roots, which produces the illusion of a land covered with vegetation. It is quite uncertain whether the Dutch discovered, to the east of Spitzbergen, an actual coast, or only an expanse of ice. In one of their voyages to the north of Nova-Zembla, they found a field of blueish-coloured ice, covered with earth, on which birds built their nests.^e Two islands of ice have continued stationary for half a century in Disco Bay. Dutch whalers have visited them, and have given them names. The same thing has occurred in the neighbourhood of Iceland.^f

An equal degree of danger attends moveable ice. The shock of these enormous masses produces a tremendous crash, which warns the seaman how easily his vessel would be crushed to pieces if it were caught between these floating islands.^g Frequently the wood that drifts upon this sea, and of which we shall afterwards speak more at length, takes fire in consequence of the violent friction to which it is exposed by the movement of the ice, and smoke and flames burst forth in the midst of eternal winter.^h This floating wood is very frequently found charred at both ends.ⁱ In winter, the intensity of the cold is continually bursting asunder the mountains of ice, and every moment is heard the explosion of these masses, which yawn into enormous rents. In spring, the movement of the ice more generally consists of the mere overturning of these masses, which lose their equilibrium in consequence of one part being dissolved before another. The fog which envelops this melting ice is so dense, that from one extremity of a frigate, it is impossible to discern the other.^k At all seasons, the broken ice, accumulated in the channels or gulfs, equally checks the passage of the adventurer on foot, whom it would instantly overwhelm, and of the mariner, by paralyzing the movements of his vessel.

Has any one the boldness to conceive the idea of a party of travellers, traversing in sledges this frozen sea, or

the icy land which occupies its imagined site? No doubt, certain precautions might enable man to respire at the very pole itself; but, what means of transport would conduct him thither? The country, in all probability, rugged, and elevated, like Greenland, Spitzbergen, and New Siberia, would not admit of the passage of sledges. Neither does marine ice stretch out in uninterrupted plains. Overturned and accumulated in a thousand different ways, it frequently offers to the view castles of crystal in ruins, shattered pyramids and obelisks, arches and vaults suspended in the air. Very often, too, in order to cross the broad and deep fissures, facilities would be required, with which the traveller could not be supplied. Yet with what delightful emotions would he tread those regions that had never been impressed by the foot of man! How rich in curious observations would be a single day and night passed at the pole! This, however, is not the place to point out the arrangements that would be requisite for the performance of such a journey. We must hasten, therefore, to unite in a descriptive form, the observations that have been already collected. The second voyage of Parry has added but little to those of which we were formerly in possession.

The north-west region of America, the first we shall describe, in all probability commences with the land of Liakhof, surnamed New Siberia; but, as this fact still remains to be established, we will confine ourselves to *Russian America*, into which we shall pass by Behring's Straits, and the chain of the *Aleutian Islands*.

These islands are divided into several groups, of which the indigenous names are, *Chao*, *Negho*, and *Kawalang*, or the *Aleutian Islands*, properly so called, the *Andreanowski*, and the Fox Islands, of the Russians. But, the custom has prevailed of comprising them all under the general name of the *Aleutian Islands*. In fact, they constitute one single and unique chain; and might be compared to the piles of an immense bridge, which has formerly been thrown across from continent to continent. They describe, between Kamtchatka, in Asia, and the promontory of Alaska, in America, an arc of a circle, which almost joins the two lands together. They are distinguished into twelve principal islands, accompanied with a very great number of lesser ones, and rocks. *Copper Island*, and *Behring's Island*, are a little detached from the rest, and approach the peninsula of Kamtchatka. Accordingly, we have already described them when speaking of Siberia.

The population of the whole of these islands does not at present exceed eleven hundred males, of whom, five hundred of the most robust and most active are employed by the Russian hunters. This people was formerly much more numerous. They had their chiefs, a particular government, and a national religion. But, with their population, the Russians have at the same time destroyed their manners, their customs, and their liberty.^l Sent as slaves to hunt and to fish, these islanders perish in great numbers on the sea, and in ill-conducted hospitals.^m

The island which appears to possess the greatest number of inhabitants is *Oonalashka*, and next to it *Sithanak*,

which is immediately adjoining. These islanders are of a moderate stature, and of a brown complexion. Their face is round, their nose small, and their eyes black. Their hair, likewise black, is harsh, and very strong. They have little beard on their chin, but a great deal on their upper lip. In general, they pierce their lower lips, as well as the cartilage which separates the nostrils, and wear as ornaments, little carved pieces of bone, or glass beads. The women have a roundness of form, without, however, being pretty. They tattoo their chin, arms, and cheeks. Mild and industrious, they manufacture mats and baskets with considerable art. They make curtains, seats, and beds, of their mats. Their dress of bear skin is worn with the hair outermost. The canoes^a of Oonalashka are built with ingenuity. Their shape is picturesque. Through the transparent skin with which they are covered, the rowers and all their movements may be discovered. These islanders are addicted to superstitions which appear to resemble Schamanism.^b They do not make use of any marriage ceremony. When they want a wife, they purchase her of her father and mother; and take as many as they can support. If they repent of their acquisition, they give back the woman to her parents, who are then obliged to restore a part of the price. The people of this Archipelago appear to be not entirely exempted from unnatural appetites. They render honour to the dead, and embalm their bodies. In this way, a mother often preserves her lifeless infant before she consigns it to the earth. The mortal remains of their chiefs and men of wealth, are not interred. Suspended in hammocks, they are gradually consumed by the air.^c The language of the Aleutians, different from that of Kamtchatka, appears to have some analogy with the idioms of Iesso, and the Kurile Islands. In the island of *Oomanak*,^d the largest, and nearest to the continent, the Russians have a Bishop, a monastery, a small garrison, and a dock-yard for building vessels.

The climate is more disagreeable on account of its moisture, than the intensity of the cold. The snow, which falls in great quantity, does not disappear till the month of May. Almost all the islands contain very lofty mountains, which are composed of a species of jasper, partly of a green and red colour, but, in general, of a yellow tint; with veins of a transparent stone, which resembles chalcedony. The island of *Tanaga* contains lakes of fresh water. There are volcanoes also, some of which are extinguished, others in activity. These latter are found in the islands of *Takawangha*, *Kanaghi*, *Ateham*, and *Oomanak*. In this latter island, in that of *Kanaghi*, as well as in that of *Oonalashka*, boiling springs issue from their frozen soil, in which the natives cook their meat and fish.

The only quadrupeds met with on these islands are foxes and mice. Among the birds, are observed ducks, partridges, teal, cormorants, gulls, and eagles.

The islands that are nearest to America produce some pines, larches, and oaks. On the western islands, nothing is met with but stunted willows. The verdure exhibits considerable richness. The mountains produce brambles, and the valleys wild raspberries, which are of a white colour, and have an insipid taste.

The island of *Kodiak*^e is mountainous, and intersected with valleys. Its inhabitants, who call themselves *Koniaghés*,^f are about two thousand five hundred in number, without reckoning the Russians, who have fixed their principal establishment here. The habitations of the islanders of *Kodiak*, less sunk in the ground than those of the Aleutians, partake, at the same time, of the nature of caverns and of huts. They have even introduced the luxury of an opening, for the escape of the smoke. The women absolutely idolize their children. Some of them educate them in a very effeminate manner. They allow their chiefs to select them as the objects of a depraved passion. These young people are then dressed like women, and are employed in all the domestic occupations of the household.

The vegetable productions of the island of *Kodiak* are the alder,^g an immense quantity of rasp and gooseberry bushes, and a great variety of roots, which, together with fish, constitute the food of the inhabitants. In the interior of the island, the pine tree forms very extensive forests, and furnishes excellent timber for building.^h

That part of the continent comprehended under the name of *Russian America*, the sovereignty of which has been claimed by the court of Russia, as a land first discovered and occupied by Russian subjects, presents on every side the most savage and gloomy appearance. Above a range of hills covered with pines and birch, rise naked mountains, crowned with enormous masses of ice, which often detach themselves, and roll down with a dreadful noise into the valleys below, which they entirely fill up, or into the rivers and bays, where, remaining without melting, they rise in banks of crystal. When such a mass falls, the crashing forests are torn up by the roots, and scattered to a distance; the echoes resound along the shores with the noise of thunder, the sea rises up in foam, ships experience a violent concussion, and the affrighted navigator witnesses, almost in the midst of the sea, a renewal of those terrific scenes which sometimes spread such devastation in Alpine regions.ⁱ Between the foot of these mountains and the sea, there extends a stripe of low land, the soil of which is almost every where a black and marshy earth. This ground is only calculated for producing coarse, though numerous mosses, very short grass, *vaccinia*, and some other little plants. Some of these marshes, hanging on the side of the hills, retain the water like a sponge, while their verdure makes them appear like solid ground; but, in attempting to pass them, the traveller sinks up to the mid-leg.^k Nevertheless, the pine tree acquires a great size upon these gloomy rocks. Next to the fir, the most common species is that of the alder. In many places nothing is to be seen but dwarf trees and shrubs. Upon no coast with which we are acquainted, have there been remarked such rapid encroachments of the sea upon the land. The trunks of trees that had been cut down by European navigators, have been found, and recognised, after a lapse of ten years. These trunks are found sunk in the water, with the earth which supported them.

The inhabitants of the coast of Behring's Straits ap-

pear to belong to the same race as the Tchuktchis, on the opposite coast of Asia, although they are said to be at war with them. Their huts, more numerous than might be supposed in a similar climate, are situated along the shores of the sea, as far as the *Kamtchatkan Gulf*,^a to which Captain Cook gave the name of *Bristol Bay*, because, in fact, it resembles that bay in England. The interior has not been visited. The *Konia* inhabit the eastern part of the peninsula of Alaska, which is almost separated from the continent by the *Lake Schelekov*. They appear to be of the same race as the Aleutians, as well as the *Kenaitze*, their neighbours to the east. The latter have given their name to the *Kenaitzian Gulf*, previously known under the name of *Cook's River*. Notwithstanding appearances to the contrary, no large river has been discovered here. Farther to the east, live the *Tchougatches*, a people of an imposing stature, who speak an idiom resembling that of the Tchuktchis. The bay, covered with islands, and called by Captain Cook *Norton's Inlet*, bears the name of the *Tchougatchian Gulf*, in the Russian charts. A river separates this tribe from that of the *Ougalchmiouts*,^b who live near the celebrated *Mount St. Elias*, which is probably a volcanic peak, and is calculated to have an elevation of 2775 toises. It was in the environs of this mountain that Behring landed, in the bay which bears his name, called in the idiom of the indigenous inhabitants, the bay of *Iakatak*. The Russians have built a small fort there; but *Sitka*, or *New Archangel*, their last establishment, is situated two degrees farther to the south, in one of the islands which Vancouver had denominated the Archipelago of King George III. A milder climate allows of the vigorous growth of the pine, the American cedar, and several other trees. Berries of an excellent taste are likewise met with; fish is abundant and delicious, and rye and barley have succeeded there.

The warlike and ferocious *Kolougis*, *Kolioujes*, or *Kalougians*,^c inhabit this coast. Possessing some fire arms, they still carry on an obstinate war against the Russians.^d It was in the territory of the Kalougians, that the unfortunate La Peyrouse discovered the *Port des Français*,^e which has been immortalized by the noble and unhappy sacrifice of the brothers La Borde. The French navigators give the most favourable account of the active and industrious spirit of the natives. Forging of iron and copper; working a kind of tapestry with the needle; weaving, with a great deal of ingenuity and taste, hats and baskets of reeds; hewing, sculpturing, and polishing serpentine stone; such are the first indications of the incipient civilization of this tribe.^f But, a strong propensity to theft, an indifference to the ties of kindred and marriage, the dirtiness of their cabins, and the disgusting custom of wearing a piece of wood in a slit in their lower lip, establish a resemblance between them and their savage neighbours, and the Siberian Russians, who come to aggravate here all the evils of primitive barbarism.

The fur which the Russians obtain from these countries, is chiefly procured from the sea-wolf, as well as other

animals of the genus *Phoca*, and likewise from the sea-otter. These latter animals, incessantly hunted, begin now to become rare. The Indians employed as hunters, bring from the interior of the continent foxes' skins of a blue, black, and gray colour. Already parties of Russian hunters have passed the Rocky Mountains, and, in all probability, have interfered with the Canadian and American hunters. The Russian Company of America possesses a capital of 260,000*l.*^g Those who are principally interested in this trade, are the merchants of Irkutsk, a town in Siberia. The factories spread along the coasts of the continent, and upon the islands, are nothing more than a collection of huts, surrounded by palisades of wood. A single ship of war would carry these feeble posts, one after the other, and would obtain a rich booty from the store-houses of the Company. Even a party of resolute Canadian hunters would be sufficient for this purpose; because the natives, detesting the Russians, would, doubtlessly, join their enemies. It may be questioned if such distant and precarious establishments are sufficiently valuable for the Russians to expose themselves to the risk of disputes with the English and Anglo-Americans, which seems to be the inevitable result of the continual advance of the hunters on both sides.

The countries that extend to the south of Russian America, as far as the confines of California, appear to form a long succession of plateaus, or very elevated basins, which are circumscribed to the east and west by two chains of mountains, the most easterly of which is, what the English have denominated the *Stony* or *Rocky Mountains*. It is at the foot of these mountains that the largest rivers of North America take their rise, such as the Missouri, which flows to the south-east; the *Saskashawan*, or *Bourbon* River, which runs to the east; and the *Unjigah*, or *Peace River*, which is lost towards the north. The other precipitous face of the north-west plateau forms a great chain parallel to the sea coast, and always at a short distance from the Pacific Ocean. This distinction between the two chains which support the north-west plateau, appears to us to result from the observations of those who have traversed this country from east to west. The first of these travellers is *Mackenzie*, who, in his map, places the chain of the Rocky Mountains at more than a hundred leagues from the shore of the Pacific Ocean. These mountains appeared to him to rise about 3000 feet above their base, which must, itself, be very elevated; since our traveller experienced a more intense degree of cold there than at *Fort Chepewyan*.^h Their summits were covered with perpetual snow. He then descended to a more temperate valley, through which flows the *Tacoutche Tesse*, or *Columbia River*.^{i k}

Here is manifestly the limit of the chain of the *Stony Mountains*. This chain continues a hundred leagues distant from the Pacific Ocean, or, at least, eighty, after allowing something for the sinuosities and ramifications.

Mackenzie then ascended very lofty mountains, where he found himself obliged to travel on snow in the month of

^a Or *Kamitchatskaia*; but the last syllables are only the termination of the Russian adjective in the feminine, corresponding to the substantive *guba*. It becomes necessary, therefore, to Anglicise it, in order to make it correspond with *gulf*.

June.^a After this, he descended towards the sea by an extremely rapid declivity; the climate immediately changed, and the empire of spring succeeded that of winter. A modern navigator, Captain *Vancouver*, constantly observed a very high chain of mountains which closely bordered the shores of the continent, and in many places were covered with perpetual snow. La Peyrouse, Cook, Dixon, and all the other navigators, perceived this maritime chain of the north-west, which runs parallel to the coast, from Cook's Inlet to New Albion, a distance of more than 1000 leagues. Even the peninsula of California appears to be nothing more than the extremity of this great chain, disengaged from its secondary branches and terraces, or lower ridges, which, in New Albion, somewhat conceal its direction.

In order to throw some light on our description, we shall adopt the nomenclature of Captain Vancouver. According to the maps of this able observer, *New Georgia* is situated between 45° and 50° of north latitude. Its limits towards the interior are not determined. The *Gulf of Georgia* is very considerable, and communicates with the Pacific Ocean to the south by *Claaset Strait*, which is supposed to be that of *Juan de Fuca*, and to the north, by Queen Charlotte's Strait. The *Columbia* river traverses the southern part and interior of this division.

Quadra and *Vancouver's Island*, better known under the name of *Nootka*, is situated opposite New Georgia. The English have an establishment in Nootka Sound.

New Hanover extends from the 50th to the 54th parallel. In front of its coasts are situated the *Fleurieu Islands*, discovered and named by La Peyrouse, but unintentionally deprived of their appellation by Vancouver, in assigning them to the *Princess Royal* of England. To the north, there are two arms of the sea which penetrate very far into the land, and have been called Hinchinbrook's Canal, and Gardner's Canal. The great island of Queen Charlotte is separated from the coast of New Hanover, by a broad channel, or arm of the ocean. The southern promontory of this island was named *Cape Hector* by La Peyrouse, and *Cape St. James* by Vancouver.

New Cornwall extends from the 54th to the 57th parallel. It comprehends a number of islands, designated under the name of *Pitt's Archipelago*, and the *Prince of Wales's Archipelago*. The coast is completely intersected by friths, or channels, which penetrate very far into the country, especially *Portland Canal*; but no river of any length has yet been discovered. The streams of water that have been met with scarcely merit the name of rivulets.

New Norfolk runs as far as the 60th parallel. To the south it comprehends *Admiralty Island*, and *King George's Archipelago*; but, as the Russians now occupy these coasts, and the name of the natives, (the *Kolioujes*,) is known, the English denomination will probably soon disappear.

New Georgia presents the prospect of a moderately elevated coast, agreeably diversified by hills, meadows, little woods, and brooks of fresh water. But behind these shores rise mountains covered with perpetual snow. Mount *Rainier* and Mount *Olympus* tower far above the other summits. The former is discernible at the distance of a hundred geographical miles.^b Very rich ores of iron appear to exist in great abundance. Stones for building, quartz, agates, gun-flints, a great variety of calcareous and argil-

laceous earths, and manganese, are met with. A luxuriant vegetation indicates the fertility of the soil. The forests contain immense quantities of the yew-leaved fir,^c the white pine, *touramahac*, Canada poplar, arbor vitæ, common yew, black and common oak, American ash, hazel, sycamore, sugar-maple, mountain and Pennsylvanian maple, Oriental strawberry tree, American alder, common willow, black alder of Canada, and the cherry tree of Pennsylvania.

The quadrupeds present nothing remarkable. Bears have been seen, as well as the fallow deer of Virginia, and foxes, but neither the bison, nor the musk ox, these animals not appearing to pass the chain of the rocky mountains in the northern latitudes. Among other sea birds have been recognised black gulls, similar to those of New Holland and New Zealand. Among the land birds there is a species of the humming bird, the brown eagle, and the white-headed eagle, the king-fisher, some very pretty varieties of the woodpecker, and an unknown bird, resembling the heron, but *four feet* in height, and having a body as large as that of the turkey.^d

In order to become acquainted with the interior of New Georgia, we must accompany Messrs. Lewis and Clarke.^e These American travellers having quitted their boats on the Missouri, on the 18th of August, embarked again on the 7th of October, on the western side of the mountains, upon the river *Kooskooskee*, in boats which they themselves had constructed. During this part of their journey, hunger and cold combined together to aggravate their sufferings. The salmon had ceased to frequent the rivers, and horse's flesh was often their principal food. The intensity of the cold is easily explained, by the elevation of the country, and the height of the mountains. In the place at which the Americans quitted the Missouri, they had a prospect of mountains covered with snow in the middle of summer, situated in between 45° and 47° of latitude, whence it is to be inferred that the summits of these mountains rise into the region of perpetual snow. This region commences in Europe, at the same latitude, at nine or ten thousand feet above the level of the sea. But even admitting that the more intense cold of North America brings this region to a lower level, we may allow these mountains a height of eight or nine thousand feet above the surface of the ocean. During their passage across the mountains, it would appear that this expedition did not discover any trace of volcanoes; for the detonations which occasioned them so much astonishment, no doubt proceeded from the bursting of glaciers, or from avalanches, which were detached from the mountains. It was in the middle of the rainy season that they arrived at the Columbia, after which they had heavy falls of rain both day and night. The little clothing and bedding that had escaped all the adventures which they had encountered up to this moment, now fell in pieces, and could no longer be made use of. Their courage did not sink, however, under so many reverses. The waters of the Kooskooskee are as limpid as crystal. At the place where it falls into Lewis River, another branch of the Columbia, the Kooskooskee is 180 yards broad. Lewis River, at its confluence with the Columbia, is 575 yards, and the Columbia itself 960 in breadth. A little below their junction, the latter river acquires a breadth of from one to

three miles. From the junction of the two rivers the country presents nothing but a succession of plains, without trees, and is merely sprinkled over with a few willow bushes. Still lower down rapid currents are met with, and there are even very considerable cascades. The most rapid of these currents is that of a channel not more than forty-five yards in breadth, in which all the waters of the Columbia are confined. Our travellers cleared this dangerous passage in their canoes, below which the river flows in a smooth and tranquil stream, and they found themselves in a charming and fertile valley, shaded by lofty forest trees, intersected by small lagoons, and possessing a soil susceptible of every kind of cultivation. The trees are remarkable for the greatest beauty. The fir rises sometimes to a height of 300 feet, and even attains a circumference of forty-five feet. These giants of the vegetable kingdom combine elegance with majesty, their columns sometimes towering 200 feet high before they divide into branches. Some of the tributary streams of the Columbia might pass for large rivers. One of them, the *Multnomah*, which issues from the rocky mountains towards the south-east, and not far from the sources of the Rio del Norte, is very broad, and, in many places, exceeds twenty-five feet in depth, even at a great distance from the sea.

It is particularly remarkable that in the bed of the Columbia, and of the last mentioned river, a great number of erect trunks of pine trees are firmly rooted at the bottom of the water, although, in many places, the river is thirty feet deep, and no where less than ten. Judging from the shattered state in which these trees were found, they must have been in this condition fully 20 years. It might hence be concluded, that the bed of the river has undergone great changes. The observations, however, which have been collected during this first expedition, are not sufficient to furnish us with any satisfactory information on the subject.

Among the islands of New Georgia, that of Nootka alone merits attention. Black granite, mica, grit for grindstones, and hematites, are found there.^a The vegetable earth in some places forms a bed of two feet in thickness. One is agreeably surprised to find a milder climate here than on the eastern coast of America in the same latitude. In the month of April, Fahrenheit's thermometer was never below 48° during the night, and, in the day, it rose to 60°. The grass was already a foot in length.^b The climate is as favourable to the growth of trees as that of the continent.

What negligence on the part of the Spaniards, not to have taken possession of this agreeable and fertile country; a country which, being situated in the rear of their colonies, might, in the hands of intelligent masters, become a military and commercial post of the highest importance! Already the inhabitants of New-York have formed a commercial company, for the furs of the Pacific Ocean, the principal establishment of which, situated 14 miles from *Cape Disappointment*, is called *Fort Astoria*.^c

That part of *New Hanover* which borders upon the open sea, resembles New Georgia, both in its vegetable productions, and the structure of its soil. Pine trees, maple, birch, and apple trees, are met with there. Near *Fitzhugh's*

Strait, the coast consists of perpendicular rock, divided by crevices, in which a very inflammable turf is found, and pine trees of moderate thickness.^d The interior of *New Hanover* was visited in 1793 by *Mackenzie*. The great river *Tacoutche Tesse* descends from the rocky mountains, and often rolls its rapid course between walls of perpendicular rock. The mountains are covered with snow, which, in some places, even descends so low that the road passes over it in the middle of summer. These mountains descend abruptly towards the Pacific Ocean, and the rivers that flow to the west have no great length of course. There are numerous small lakes; and sinks or tunnels, of a regular conical form, such as are frequently met with in calcareous countries.^e

The same luxuriant vegetation is observed here as in New Georgia. The pines and birch trees compose forests, in the more elevated parts of the country. Upon the lower mountains, the cedar is met with, or rather the cypress, of so enormous a size, as sometimes to measure twenty-four feet in circumference, and the alder rises forty feet high, before it sends off any branches. There are also poplars, firs, and probably many other useful trees.^f The wild parsnip grows in abundance round the lakes, and its roots furnish a nourishing food. The rivers contain trout, carp, and salmon. The latter of these fish are caught near dikes, constructed across the river, which reminds us of the salmon fishery of Norway.

New Cornwall experiences a much more intense degree of cold, than the two preceding countries. At 53° 30', upon *Gardner's Canal*, which, it is true, penetrates very far into the country, mountains are seen covered with ice and snow, that seem never to melt.^g Nearer the sea, the climate, becoming milder, allows forests of pine to cover the naked and steep rocks. The raspberry bush, cornel shrub, gooseberry bush, and the plant called the *Labrador tea*, are found in considerable quantities. Hot springs have been discovered; and there is an island entirely composed of slate,^h and a curious rock, shaped like an obelisk, has been denominated the *New Eddystone*. Floating wood is found in great abundance on many parts of this coast.

In the islands which Vancouver has designated by the names of *George the Third's Archipelago*, and *Admiralty Island*, the soil, although rocky, contains several crevices, stripes, and little plains, which support magnificent forests of pine and other lofty trees; and no where is perpetual snow discovered. This incontestibly proves that it is the elevation of the soil that renders the climate of the continent so severe.

It is especially in the environs of Nootka, that European voyagers have had an opportunity of observing the indigenous inhabitants. These savages call themselves *Walkash*. Their height is above the middle stature, and they are of a muscular frame. Their features are characterised by a prominence of the cheek-bones. Their face is often very much compressed above the cheeks, and appears to sink abruptly between the temples. Their nose, flat at the base, is marked by wide nostrils, and a round point. Their forehead is low, their eyes small and black, and their lips broad, thick, and rounded. In general, they are

entirely destitute of beard, or, at most, have only a small thin tuft at the point of their chin. This deficiency, however, is, perhaps, owing to an artificial cause; for, some of them and, especially their old men, have bushy beards, and even mustachios. Their eye-brows are scantily supplied with hair, and are always straight; but they have a considerable quantity of very harsh and very strong hair on their head, which, without a single exception, is black and straight, and floats on their shoulders. A coarse dress of linen, with a covering from the skin of the bear or sea otter, red, black, and white pigments, with which they besmear their body, the whole of their ordinary costume, in short, forms the image of wretchedness and ignorance. Their war-dress is extraordinary. They muffle up their head with pieces of wood, carved into the representation of eagles, wolves, and porpoises' heads. Several families live together in the same hut, the wooden half partitions of which give it the appearance of a stable. Some of their woollen stuffs, although manufactured without a loom, are very good, and are ornamented with figures of a brilliant colour. They carve clumsy statues of wood.

Their light canoes, which are flat and broad, bound over the waves in the steadiest manner, without the assistance of the outrigger,^a an essential distinction between the canoes of the American tribes, and those of the southern parts of the East Indies, and the islands of Oceania.

The apparatus which they make use of in hunting and fishing, is equally ingenious and well executed. A kind of oar, furnished with teeth, with which they hook the fish, is particularly noticed. This weapon, as well as the javelins with which they strike the whale, announce a high inventive genius. The javelin is composed of a piece of bone, furnished with two barbs, in which is fixed the oval-cutting edge of a large muscle-shell, which forms the point. Two or three fathoms of cord are attached to it. In order to throw this weapon, they use a stick, 12 or 15 feet in length, with the line attached to one extremity, and the javelin to the other, so as to detach it from the stick, like a buoy, when the animal escapes.^b

The tribes that inhabit New Georgia, differ in stature, manners, and mode of living; but in their characteristic features, they all resemble the inhabitants of Nootka Sound. The apparent depopulation of the environs of *Port Discovery*, is singularly contrasted with the great number of skulls and other human bones, which have been found collected together here, as if all the neighbouring tribes had made this their common cemetery.^c Messrs. Lewis and Clarke have observed the inhabitants of the interior. In descending the rocky mountains, they saw several tribes, who have the habit of flattening the heads of their children, at a very early period of infancy. The *Solkouks*^d have their skulls flattened to such a degree, that the top of the head is placed in a perpendicular line to their nose. The idioms of these tribes differ as much as their features. The language of the *Enouchouts*^e is understood by all the tribes that inhabit the Columbia, above its great fall; but near the coast, it is not understood, and they make use of

the idiom of the *Echillouts*,^f which is completely different. The language of the *Killamucks* is very widely diffused among the tribes that live to the south, between the coast and the river Multnomah. The *Koukouses*,^g who border on the Killamucks, but live farther in the interior, are of another race, are fairer, and have not their heads flattened. In general, the colour of all these tribes, whether they have round or flat heads, is of a brown copper hue, and is clearer than that of the tribes of the Missouri and Louisiana. Woman is not degraded as among nations of hunters, but is treated with considerable attention by this people, who subsist by fishing. The sea air injures their eyes and teeth. The tribes who live near the great fall of the Columbia, build their houses of wood, a degree of industry which is not met with in the immense tract of country between this fall and Saint Louis.^h

Some tribes of *New Hanover*, observed by Mackenzie, present to us several peculiar traits, which recall to our recollection the islanders of Otaheite and Tongataboo. The inhabitants of the Salmon River, or, as they themselves call it, *Annah-yoe-Tesse*, live under a despotic government.ⁱ They have two religious festivals; the one in spring, the other in autumn.^k In their solemn entertainments, they spread mats before their guests, while the people are seated in front in a semicircle. They mark their friendship for an individual by clothing him with their own dress, to which they sometimes add the offer of their place in the conjugal bed.^l But these characteristic manners are likewise met with among many other tribes of America and Asia. These tribes are generally of a middling stature, strong and muscular, have round faces, prominent cheek-bones, small reddish-grey eyes, and a complexion of an olive-copper colour. Their head assumes a conical shape, in consequence of continual pressure from infancy. Their hair is of a deep brown. They make their dress of a kind of stuff composed of cedar bark, and sometimes interwoven with strips of otter skin. They are clever sculptors. Their temples are supported by wooden pillars, carved into caryatides. Some of these figures are in an upright posture, in the attitude of conquerors; others are stooping, overwhelmed, as it were, with their load.^m

The *Sloua-Cuss* Indians inhabit that part of the country where the high chain of mountains that border the sea begins to sink towards the basin of the River *Tacoutche Tesse*. These Indians possess an agreeable physiognomy, evince a great love of cleanliness, and do not ill-treat their women. They preserve the bones of their parents enclosed in chests, or suspended on posts.ⁿ Though faithful guardians of the property deposited with them by travellers, they endeavour to steal whatever they find in the possession of those very strangers.^o

The *Nansrud*, or Fall Indians, the *Nagailers*, and the *Atnahs*, dwell on the upper part of the *Tacoutche Tesse*. Among their various idioms, there are some that resemble the languages of the Chippewyans, and other nations of Canada.

Vancouver saw villages on the coast that were built upon

a sort of artificial terrace, the representation of which, as given in the atlas of this voyager, reminds one a little of the *Hippas* of New Zealand. The village of Chelaskys, situated in Johnston's Straits, although composed of miserable huts, is ornamented with paintings, which appear to have a hieroglyphical meaning. This description of painting is diffused over the whole of the north-western coast.

The inhabitants of *Tchinkitane Bay*, called by the English *Norfolk Sound*, in King George's Archipelago, resemble, in stature and figure, those of Nootka; but their coarse, harsh hair, establishes a likeness between them and the more northern nations and the Esquimaux. The young people pluck out their beard, but the old allow it to grow. Their women wear an extraordinary kind of ornament, which gives them the appearance of having two mouths; it consists of a small piece of wood, which they force into the flesh below their under lip.^a These people show a great deal of address in their manner of

carrying on trade, and are exceedingly courageous in the whale fishery. Their tanning, carving, painting, and other arts, prove them to be an intelligent and industrious people. They preserve the heads of their dead in a kind of sarcophagus, ornamented with polished stones.^b

The moral sketch which we have now traced of the tribes of New Georgia and New Hanover, proves that their genius has been developed during many ages of liberty. We must allow that in the idioms,^c manners, and belief of these tribes, there is some similitude with the Aztecs, or Mexicans. Which of these two nations is the source of the other? Judicious criticism suggests that, to place the cradle of Mexican civilization in the midst of these tribes of fishermen, would be to hazard an important conclusion from a small number of equivocal facts. Another hypothesis, altogether absurd and contemptible, considers them as a colony of the Malays of Polynesia, with whom they have not the slightest physical resemblance.

thing can be more dissimilar than the Aztec and New Georgian. The latter wants the great American characters of *epenthesis* and *composition*. Mithridates, Von Adelung, III. 65. 225—230.—Tr.

BOOK LXXVII.

THE DESCRIPTION OF AMERICA CONTINUED.

Regions of the North, and North-East; or the Country on Mackenzie's River, and the country round Hudson's Bay; Labrador, Greenland, Iceland, and Spitzbergen.

WHEN we quit the north-west region, cross the Rocky Mountains, and approach towards Hudson's Bay and the unknown frozen seas, we perceive an immense country, intersected with lakes, marshes, and rivers, to a greater extent than any other part of the globe with which we are acquainted. Few mountains rise above this savage and icy plain. The numerous waters of these countries may be reduced to two classes; some flow towards the unknown seas of the north, others roll their tributary streams to Hudson's Bay. Among the former, we observe the *Athapescow* or Elk River, and the *Unjigah* or *Peace River*. The first of these comes from the south, and loses itself in the lake of the hills, or Lake Athapescow; the second descends from the north-west plateau. When high, its waters flow into the Lake Athapescow; but when it is low, it receives the waters of that lake.^a The united river bears the name of the *Slave River*, and empties itself into the *Slave Lake*, from which issues Mackenzie's River, that runs towards a northern sea, or gulf, hitherto little explored. Late-ly, indeed, as was noticed in the former Book,^b the adventurous Franklin surveyed 600 miles of its coast, proceeding from the mouth of Copper-Mine River, almost directly to the eastward, in the parallel of 67° 30' north. At the warm-est season of the polar year, the greater part of it was girt with ice, and the land almost constantly covered with snow. The water approached so much to the saltness of the sea, that this experienced mariner does not seem to have been able to remark any appreciable difference. Tides were also observed. It abounds in islands, and no coast known affords more numerous or deeper indentations into the surrounding land. To these dreary regions, even the hardiest Indian hunters refused to accompany the English, who, nevertheless, met with frequent traces of Esquimaux, a race which, diminutive in stature and deficient in courage, every where seeks shelter amid the desolation of the pole.^c Slave Lake, which is more than a hundred leagues in length, is sprinkled with islands that are covered with trees resembling the mulberry. Mackenzie found them surrounded with ice in the middle of June. All these lakes and rivers unite to form one uninterrupted current of water, extending above 600 leagues in length, and which has a remarkable resemblance to the magnificent rivers of Siberia. One

^a The Unjigah forms a delta at its mouth, the southern branches of which communicate with the lake, and the northern with the Slave River. The level of this delta is so uniform, and the current of the river above so feeble, that the direction of the current in the branches communicating with the lake, varies according as the waters of the river or lake are highest.—Mackenzie.—P.

is tempted to inquire, why do such superb streams waste their fertilizing waters upon these frozen deserts? They manifest the power, and, we cannot doubt, the wisdom of their Creator.

The *Copper-Mine River*, discovered by Hearne, likewise flows towards the north, but is only of a moderate size, and from frequent falls and narrows, is scarcely navigable, even by canoes, near its opening into the Polar Sea. Among the crowd of lakes that lie in the immediate vicinity of Hudson's Bay, but which, nevertheless, have no outlet, Lake *Doobaunt* is particularly noticed.

Mississippi, or *Churchill River*, empties itself into Hudson's Bay, but is connected, by means of lakes, with Athapescow River, an invaluable communication, if it had taken place in a more temperate climate. The hydrographical system of Hudson's Bay extends very far to the southwest, which obliges us to include within our *northern zone*, part of those regions that were formerly comprised under the vague denomination of Canada. Two considerable rivers that come from the foot of the western mountains, form the River *Saskashawan*,^d which, after being interrupted by a great *rapid*, (it is thus that the Canadians name a long fall of water, with a gentle slope,) descends into Lake *Winnipeg*, a lake of more than sixty leagues in length, by thirty or forty broad. Its banks are shaded by the sugar-maple, and poplar; and it is surrounded by fertile plains, which produce the rice of Canada.^e This lake, which likewise receives the great River *Assiniboil*, or *Assiniboin*,^f united to the Red River, discharges itself into Hudson's Bay, by the *Nelson* and *Severn* Rivers. Lake Winnipeg is the Lake *Bourbon* of the *French*; and the River *Bourbon* is composed of the *Saskashawan* and the *Nelson*.

The extreme severity of the winter is felt even under the 57th parallel of latitude; the ice on the rivers is eight feet thick; brandy freezes; and, in consequence of the cold, the rocks split with a tremendous noise, fully equal to that of heavy artillery, and the shattered fragments fly to an astonishing distance. The temperature of the air is subject to the most capricious variations. Rain suddenly overtakes you, at the very moment when you are admiring the serenity of a cloudless sky; while, on the other hand, the sun will sometimes suddenly burst forth in the midst of the heaviest showers; and at its rising and setting, is preceded, or followed, by a cone of yellowish light. The *aurora borealis* sheds in this climate a light which, some-

times mild and serene, sometimes dazzling and agitated, equals that of the full moon, and in both cases is contrasted, by its blueish reflection, with the fiery colour which sparkles in the stars.

These imposing scenes, however, serve only to augment the solemn melancholy of the desert. Nothing can be more frightful than the environs of Hudson's Bay. To whichever side we direct our view, we perceive nothing but land incapable of receiving any sort of cultivation, and precipitous rocks that rise to the very clouds, and yawn into deep ravines and barren valleys, into which the sun never penetrates, and which are rendered inaccessible by masses of ice and snow that seem never to melt. The sea in this bay is open only from the commencement of July to the end of September, and even then, the navigator very often encounters ice bergs, which expose him to considerable embarrassment. At the very time that he imagines himself at a distance from these floating rocks, a sudden squall, or a tide, or current, strong enough to carry away the vessel, and render it unmanageable, all at once hurries him amongst an infinite number of masses of ice which appear to cover the whole bay.^a

Hudson's Bay affords only a small quantity of fish, and all attempts at the whale-fishery have been unsuccessful. Shell fish are likewise scarce. But the lakes, even those farthest to the north, abound in excellent fish, such as the pike, sturgeon, and trout; and their banks are inhabited by aquatic birds, among which are observed several species of swans, geese, and ducks.

The English, under Franklin, in 1819, found abundance of fish in Copper-Mine River, at its opening into the Polar Sea, though that sea itself scarcely afforded them any supplies. Of the fish and fowls which frequented these lakes, an interesting account has been given by Dr. Richardson, the surgeon and naturalist to the expedition.^b

The principal quadrupeds are the buffalo, musk-ox, moose-deer, rein-deer,^c beaver, wolf, foxes of different colours, the lynx or wild cat, white, black, and brown bears, the wolverine, otter, jackash,^d wejack, pine-martin, ermine, skunk, musk-rat, porcupine, hare, rabbit, wood-squirrel, climbing-squirrel, and different species of mice.

The banks of Churchill River, principally produce some berry-bearing shrubs, the gooseberry bush, three species of vaccinium, the black currant, strawberry, and a small species of wild rose, the burdock, wood-sorrel, dandelion, a species of cistus, a species of box, different kinds of moss, several descriptions of grasses, and peas. The trees which compose the forests of this savage country, present very few species; namely, the pine, dwarf larch, poplar, willow, and dwarf birch. Farther to the west, the latter is very numerous. In the country of Athapescow, the pine, larch, poplar, birch, and alder, acquire a greater height; but round Lake Winnipeg flourish almost all the trees of Canada proper. Mackenzie has there made a very extraordinary observation. When the ground is cleared by means of fire, those places that had been formerly covered with pine and birch trees, no longer produce any thing but poplars, although not a single tree of the kind had ever grown there before. The banks of the Red River, the Assiniboil, and the Saskashawan, appear

to be susceptible of several kinds of cultivation. Barley and rye have ripened there, and hemp becomes very fine; but their great distance from the ports of Canada, and the little advantage to be derived from those of Hudson's Bay, obstructed as they are with ice during two-thirds of the year, would greatly embarrass an infant colony, both in receiving supplies, and in exporting its productions. It can only be by a gradually progressive advance, that the European population of Canada will ever penetrate as far as these regions.

It is merely for a short period that the avidity of gain attracts Europeans to this country. The fur trade had enriched the Canadians under the dominion of the French. The English have formed two companies here, that of Hudson's Bay and the North-West Company. The Mediterranean Sea, which they have denominated Hudson's Bay, had been visited in 1610, but it was in 1670 that a Company obtained a charter, bearing the privilege of forming establishments there. This Company claims a right to vast territories, situated on the west, the south, and the east of the Bay, and extending from 72° to 114° 38' west of London.^e The exportations of the Company amount annually to 16,000*l.* Sterling; and the importations, which greatly augment the revenue of government amount, in all probability, to 30,000*l.* Sterling. But the profits of this society have been considerably diminished by the North-West Company, lately established at Montreal.

It is asserted that a chain of heights, which gives rise to the rivers running to the north and south, as far as Lake Winnipeg, serves as a line of separation between Canada and the territory of the Hudson's Bay Company; but the limit is not fixed in a legal manner. The Hudson's Bay Company has not penetrated to the west beyond Hudson's House, while, on the contrary, the North-West Company, more courageous and more enterprising, has almost reached the shores of the Pacific Ocean, and has extended itself along Mackenzie's River, towards the Arctic Sea, or land. But the Hudson's Bay Company, in virtue of its charter, pretends to a sovereignty over all the rivers that flow into Hudson's Bay; and upon this principle, gave up a few years ago, to Lord Selkirk, its chief stockholder, a vast territory on the banks of Lake Winnipeg, and the River Assiniboil. The colony which this nobleman conducted thither, has experienced strenuous opposition on the part of the fur traders of Canada, whom it wished to prevent from hunting within its limits. They have even had recourse to violence; and the colony has been obliged to dissolve itself; but the two parties, after pleading before the Canadian tribunals, have at length settled their respective claims by a union of interests.

The countries adjacent to Hudson's Bay, together with Labrador, have been denominated, by a tribute of homage by no means flattering to the mother country, *New Britain*; but this name has not been adopted in the charts. The name of Nova Dania also speedily disappeared. The country situated to the west of the bay, has generally been called *New Wales*, and that to the east, the *East Main*. To the south, James' Bay extends a hundred leagues into the country. It is in the neighbourhood of this bay that

the most important establishments are situated, such as *Albany Fort*, *Moose Fort*, and the factory of *East Main*.^a Farther to the south, and on the confines of Upper Canada, we find *Brunswick* house, *Frederick* house, and some others. To the north is *Severn* house, situated at the mouth of the river of that name. *York Fort* is built on the Nelson River, and farther to the north, is *Churchill Fort*, which is supposed to be their last establishment in this direction. *Fort Chippewyan*, on Lake Athapescow, belongs to the North-West Company, which possesses several others on the banks of Lake Winnipeg, and the Rivers Assiniboil, Saskatchewan, and Mackenzie. These establishments, far from permanent, are often even without any particular name, and consist of nothing more than a house, surrounded by pallsades.

Three indigenous nations divide between them these melancholy regions. The *Esquimaux* inhabit the country between the gulf called the *Welcome*^b and Mackenzie's River, and probably as far as Behring's Straits. To the south they extend as far as Slave Lake, and to the north, the territory which they occupy is bounded by an icy sea, if such a sea really exists, or else they extend their wandering excursions into a frozen desert.^c A permanent establishment of this nation was met with by Captain Ross at Prince Regent's Bay, in latitude 76° N.;^d and their huts were observed by Captain Parry to be numerous in many parts of Melville Island, in latitude 75° N. The latter officer observed them frequently in the islands of the Archipelago of Barrow's Straits, though their timidity prevented any intercourse.^e Little, squat, and feeble, the complexion of these Polar men partakes less of a copper hue, than of a reddish and dirty yellow. Their huts, which are of a circular form, are covered with deer-skins, and can only be entered by creeping on the belly. Yet the rude necessities of the climate have suggested to this feeble race many contrivances which do honour to their ingenuity. The *snow-house*, or the comfortable, and, comparatively speaking, commodious dwelling, which they construct from the frozen snow that surrounds them, affords a favourable example. The rapidity and neatness with which they raise these edifices, and render them impervious to the rigorous atmosphere around, is truly admirable; and these edifices, when finished, afford their inhabitants a similar protection to that which the vegetable world receives from a covering of snow.^f The *Esquimaux* of Prince Regent's Bay, and of the Arctic Highlands, are entirely ignorant of boats and canoes, affording, it is said, a unique instance of a fishing tribe unacquainted with the means of floating on the water. Ross advances strong grounds for considering them as the true aboriginal race, from whence all other *Esquimaux* are derived. They seem utterly ignorant of the nations to the south, and may be considered as an independent tribe, separated by almost impassable mountains from the regions of South Greenland, and extending beyond the most northern inlet of

Baffin's Bay. They are almost entirely destitute of religious ideas.^g The other tribes have canoes made of the skins of the sea-calf,^h which sail with great swiftness. These savages patiently work a gray and porous stone into the shape of pitchers and kettles. The edges of these vases are elegantly ornamented.ⁱ They preserve their provisions of meat in bags, filled with whale oil. Those who live near the mouth of Mackenzie's River, shave their heads, a peculiar custom, but not sufficient of itself to prove an Asiatic origin.

The *Chipiwans*, who are likewise called *Chippaways*, and *Chopewyans*,^k have been observed by Mackenzie between Slave Lake and Lake Athapescow. They appear to extend as far as the rocky mountains on the west, and to the sources of the Missouri on the south-west. The *Snake* Indians, the *Cattanahowes*, and other tribes, appear to belong to the same nation. A branch of the *Chippaways* has extended itself into the United States. Although somewhat less copper-coloured, and having rather less beard than the neighbouring nations, the *Chipiwns* have not the Mongol complexion. Their hair is straight, like that of the other Americans, but is not always of a black colour. They make themselves a dress of deer skin, which is very warm and very durable.^l Although extremely pacific amongst themselves, they are continually at war with the *Esquimaux*, over whom the superiority of their numbers gives them great advantage. They put all those to death who fall into their hands; for fear has established the principle of never taking any prisoners. The *Esquimaux* entertain a continual apprehension of these *Chippaways*,^m who, in their turn, live under subjection to the *Knistenaux*, a nation who are, or lately were, far less numerous than themselves.

The country which the *Chipiwns* call their own, possesses very little vegetable earth; and, accordingly, it produces scarcely any wood or grass. The lichen, however, which affords food to the deer, is found in considerable quantity. Another species of lichen, named *Tripe de Roche*, grows on the rocks, and serves as food to the inhabitants. They boil it in water, and when it is dissolved it forms a glutinous and tolerably nourishing substance. The English, in 1819, found it act as a cathartic. Fish abound in the lakes of the *Chipiwns*, and herds of deer cover their hills; but although they possess more foresight, and are the most economical of all the savages of North America, they suffer a great deal in some seasons from want of food.

The *Chipiwns* affirm that they are descended from a dog; and, accordingly, they respect this animal as sacred. They represent the Creator of the world under the figure of a bird, whose eyes dart lightning, and whose voice produces the thunder. They have a traditionary belief in a deluge, and in the great longevity of the first inhabitants of the world.ⁿ

ⁿ For an excellent account of these and the succeeding Indians, see Dr. Richardson's first Journal, in Franklin's Journey to the Polar Sea.

Northern Indians, and who inhabit the country between Copper-Mine River and Hudson's Bay, as far as Churchill River, may be looked upon as a branch of the Chipiwans. These Northern Indians are, in general, of an ordinary stature, and are well proportioned and strong; but they want that activity and that suppleness which characterize the Indian tribes who inhabit the southern and western shores of Hudson's Bay. The colour of their skin somewhat resembles dark copper. Their hair is black, thick, and straight, like that of other Indians. Like the Chipiwans, they attribute their origin to the amours of the first woman with a dog, who, during the night, was transformed into a beautiful young man.^a

Though they display great art in extracting little presents from strangers, they are, nevertheless, very peacefully disposed, and never become intoxicated. Amongst them, woman is considered as a mere beast of burthen. If any one ask a northern Indian in what beauty consists, he will reply, that a broad flat face, small eyes, and hollow cheeks, each of which is marked with three or four black streaks, a low forehead, a long chin, a large and hooked nose, a dark complexion, and pendant breasts, constitute genuine beauty. These charms are greatly enhanced in value, when the fair possessor knows how to prepare all sorts of skins, and make dresses from them, and is able to carry a weight of from a hundred to a hundred and forty pounds in summer, and can draw a much greater load in winter. The mother of *Greenstockings*, a beauty somewhat of this description, who attended Franklin's expedition in 1819, took alarm at the sketch prepared by the draughtsman, lest her charms should tempt the king of England to carry off her daughter from the country! The prevalence of polygamy procures them a greater number of these submissive, faithful, and even affectionate servants. Upon receiving an affront from any one, they challenge their enemy to wrestle. Murder is very rare amongst them. Any one who has shed the blood of his countryman, is abandoned by his kinsmen and friends, and is reduced to a wandering life; and whenever he issues from his place of concealment, every person exclaims, "There goes the murderer!"

The *Knistenaux*, denominated *Cristinaux* by the early Canadians, and *Killistonoës* by some modern writers—*Crees* by the English—wander over or inhabit all the country to the south of the lake of the hills as far as the lakes of Canada, and from Hudson's Bay to Lake Winnipeg. The *Knistenaux* are of a moderate stature, are well proportioned, and possess a remarkable degree of activity. Black and piercing eyes animate their agreeable and open countenance. They paint their face of different colours. They wear a simple and convenient dress, cut and ornamented with taste; but sometimes they hunt, even during the severest cold, almost entirely naked. It appears that, of all the savages of North America, the *Knistenaux* have the handsomest women. Their figure is well proportioned, and the regularity of their features would obtain them admiration, even in Europe. Their complexion is not so dark as that of other savage women; because their habits are much more cleanly. These Indians are naturally mild, honest, generous, and hospitable, when the pernicious use of spirituous liquors has not changed their natural disposition. They do

not look upon chastity, however, as a virtue, nor do they imagine that conjugal fidelity is at all necessary to the happiness of the married state. Accordingly, they offer their wives to strangers, and exchange them with each other, as Cato is said to have done. The fogs which cover their marshes, are believed to be the spirits of their deceased companions.

The eastern coasts of Hudson's Bay form a part of the peninsula of *Labrador*. This country, almost of a triangular shape, is bounded on the east by the arm of the sea called *Davis's Straits*, and on the south by Canada, and the Gulf of St. Lawrence. Thus detached from the arctic lands, Labrador ought to partake, in some degree, of the nature of the temperate cold regions; but whether it is owing to the elevation of its mountains, with which we are still almost unacquainted, or to the influence of the perpetual fogs that cover the neighbouring seas, it is a country fully as frozen as those to the west of Hudson's Bay. Cartwright assures us that he met with a family of the natives living in a cavern hollowed out of the snow. This extraordinary habitation was seven feet high, ten or twelve in diameter, and was shaped like an oven. A large piece of ice served as a door. A lamp lighted the inside, in which the inhabitants were lying on skins. At a short distance was a kitchen, likewise constructed of snow.^b They describe a circle on the frozen snow, and cutting it into segments with their knives, build it up with great regularity, till the blocks of snow meet at the top, and constitute a not ungraceful dome. All that is known of Labrador is a mass of mountains and of rocks, intersected with innumerable lakes and rivers.^c Lake *Aschkunipi*, which is probably the *New Sea*^d of D'Anville's maps, appears to flow both into Hudson's Bay, and the Gulf of St. Lawrence. All the waters of this region abound in a remarkable degree with fish; among which are noticed the salmon, trout, pike, eel, and barbel. The bears combine together in numerous herds, to catch the salmon, near the cataracts, where great numbers are stopt in their ascent, and are exceedingly relished by that animal. Some of them plunge into the river, and pursue their prey under water, only reappearing at the distance of one or two hundred paces, while others, again, more indolent, or less active, appear as if they had come merely to enjoy the spectacle. Beavers, as well as rein-deer, absolutely swarm. The air is milder in the interior of the country, where some appearance of fertility is perceived. According to Curtis, the valleys are covered with pines and pinasters. A great deal of wild celery, and many antiscorbutic plants, grow there. No botanist has examined this extensive country. But the most extraordinary fact that has been transmitted to us is, that the boggy land on the coast becomes covered with grass, after having been fattened by the carcasses of the seals which are cast ashore. This, however, requires further confirmation. The southern parts of Labrador might be cultivated, but it would be difficult to defend the colonists from the bears and wolves, and the cattle could not quit their stable for a longer period than three months in the year. The eastern coast presents nothing but a continued precipice of barren rocky mountains, which are covered in some places with a black turf, and a few stunted plants. It is over-

^d "Mer Nouvelle."

spread with fogs, which, however, appear not to continue so long as they do in Newfoundland.^a Although the greater part of their water is derived from melted snow, *goitre* is a disease unknown amongst the inhabitants of this region. The eastern coast is covered with thousands of islands, inhabited by aquatic birds, particularly the duck from which the eider down is procured.

The most celebrated production of this country is the Labrador felspar, discovered by the Moravian brethren in the middle of the lakes of the elevated district of *Kylgaped*, where its vivid colours were reflected from the bottom of the water. The rocks are generally granitic. The district of *Ungawa*, situated to the west of Cape *Chudleigh*, abounds in red jasper, hematites, and pyrites.

The Esquimaux have peopled all the northern and eastern coasts of this country, and live on fish.

It is amongst these people that the Moravian brethren have founded the three settlements of *Nain*, *Okkak*, and *Hoffenthal*.^b Upon their arrival, the Esquimaux were in the habit of putting their orphans and widows to death, to prevent them from being exposed to the risk of dying of hunger. The missionaries, after teaching them a variety of useful arts connected with fishing, built a magazine, in which each of the natives might deposit his superfluous stores, and prevailed upon them to set aside a tenth part for widows and orphans. This is the true way to convert a savage people.

A peculiar tribe inhabits the southern mountains, who have been compared to the Egyptians;^c but a mixture with the French Canadians effaced their characteristic features before they were examined with sufficient care. This people have adopted the Catholic religion, and live on rein-deer and game. They have received no other name than *Mountaineers*. Another tribe, called *Escopics*, inhabit the western part.

To the north-east of Hudson's Bay, some arms of the sea, almost perpetually frozen, conceal from us an archipelago of several large islands, among which are noticed, those named *James*, *Barren*, *Northmain*, *Southampton*, and *Mount Raleigh*. To the south, Hudson's Strait separates these islands from Labrador; to the east, Davis's Straits divides them from Greenland; to the south-west, they are washed by the Gulf called *Welcome* by the English, and *Mare Christianeum* by the Danish voyager Munk, who was the first to penetrate it; but to the north-west, and north, these lands continued almost absolutely unknown till the splendid discoveries of the English in 1818, 1819, 1820, 1821, 1822, 1823, by the great navigators mentioned at the beginning of this Book, who, undaunted by the appalling horrors of the elements around them, have penetrated far into the secret, untrodden regions of the pole. Captains James and Fox, who, in the seventeenth century, entered the arm of the sea which separates James, or Cumberland Island, (if it be an island,) from Southampton Island, and of which *Repulse Bay* forms one extremity, found all their efforts to advance any farther prove fruitless, in consequence of the fixed ice which, at that period, as well as at the present day, obstructed this channel. The frightful picture of the sufferings to which cold and want of food

exposed these navigators, appears to have banished, for a long time, all thoughts of any fresh attempt. Yet such attempts, were they successful, would be deeply interesting to geography, for, it is not improbable that this passage communicates with a sea, in all likelihood, the inland sea described by Hearne. The perpetual accumulation of ice, between these two islands, in 65° of latitude, while, on the other hand, it is quite customary to ascend Davis's Straits as far as 72°, and Baffin's Bay, lately, to its northern extremity in 76°, appears to indicate here the opening to an inland sea, or perhaps the mouth of a river, which serves as an outlet to extensive lakes.

In 1818, Captain Ross completed the circumnavigation of Baffin's Bay, the northern extremity of which, the bottom of *Smith's Sound*, he estimated to be in latitude 77° 45'. The ship's latitude at the time was 76° 46½', longitude 75° 21' 45".^d The middle of this oblong bay, seems every where occupied with impenetrable ice, between which and the land is the only passage for ships. It was by following this opening that the survey of the coast was made by the ships *Isabella* and *Alexander*, under the command of Captain Ross; and the positions ascertained, the appearance of the land, the situation of the islands, and the general form of the bay itself, thus established, afford a complete verification of the lately disputed discoveries of Baffin.^e Still many openings on its shores remain to be explored, particularly on that of the western side. In prosecution of this object, and subordinate to the great desideratum of a north-west passage, Captain Parry sailed into Lancaster Sound, latitude 73° 50', in (July 30,) 1819; and by following its course almost directly to the westward, was enabled to proceed along a channel, or archipelago, which is entered by Barrow's Strait, as far as Melville Island, in latitude 74° 30' N. longitude 114° W. This channel presented several extensive openings to the north and south; to the north, several passages between the different islands of this new archipelago, which has been named the *North Georgian*, in honour of his present Majesty, George the IV. of Great Britain: to the south, *Navy-board Inlet*, *Admiralty Inlet*, and *Prince Regent's Inlet*. The latter is two degrees of longitude in breadth at the narrowest, and gradually widening southwards and westwards, has been supposed to communicate with *Repulse Bay*, and thereby to conjoin Hudson's Bay with Lancaster Sound, and to insulate the whole western coast of Baffin's Bay. It is also suspected, as we have just said, that both communicate with the sea of Hearne, and with that ocean which washes the shores to the east of the entrance of Copper-Mine River, ascertained by Franklin in the same summer, 1819. Captain Parry's second voyage in 1822, 1823, being directed to *Repulse Bay* and Fox's inlet, where the ice seems almost perpetual, has been completely frustrated; but it is at present in the contemplation of the British Government to despatch the same navigator to explore Prince Regent's inlet from Barrow's Strait southwards. A passage to the Arctic Sea of Franklin may thus be still within the reach of discovery.

The country to the north of Barrow's Straits, and continuous with Greenland, Parry has named *North Devon*.

^e Pinkerton's Geogr. 8vo. p. 534—651.

The islands of the New Archipelago, or Georgian Islands, as they open successively to the west, are *Cornwallis*, *Griffith*, *Somerville*, *Browne*, *Lowther*, *Garrat*, *Baker*, *Davy*, *Young*, *Bathurst*, *Byam Martin*, *Sabine*, *Melville*.^a Cornwallis, Bathurst, and Melville Islands, are the largest, the latter extending from 106° to 114° of longitude from Greenwich, and from 74° 25' to 75° 50' of northern latitude. It is about 240 miles long, and 100 miles in breadth. Dreary masses of sandstone stratified horizontally, and exhibiting marks of rapid and recent decomposition in the perpendicular fissures by which they are intersected, naked of every covering except snow and a few lichens, form the rugged coast which presents itself to the navigator of the Georgian Archipelago. In the ravines formed between these masses by the annual thaw, traces of a vegetation, more or less vigorous according to the soil, appear during the brief summer, which allures to these regions, the reindeer, ducks, geese, swans, ptarmigans, waterfowl, hares, and musk oxen, which the extreme rigour of the polar winter had driven to seek food and shelter in the woods of North Canada. A tribe of Esquimaux^b seems likewise to resort hither in summer, and the relics of musk oxen and other indigenous animals strewed around their deserted huts, shows that they do not subsist by fishing alone, but probably repair to these islands with the prospect of hunting during the summer season, when game is abundant even in the solitary insulated valleys of Melville Island. It is improbable, however, that with all their ingenuity and hardness, they have ever been able to withstand the extreme severity of its winter. On the 15th of February, 1820, in *Winter Harbour* of Melville Island, the thermometer stood for some time at *minus* 55° of Fahrenheit, the greatest natural cold hitherto observed; and the mean temperature of that entire month was 32° below Zero, and of the whole year only 1°.33 above it.

At Melville Island no tree or shrub refreshes the eye, and though the soil seems rich in the valleys, grass, moss, a few lichens, sallads, and saxifrages, constitute almost the whole of its botany. Clay, slate, and slaty sandstone, are its aggregate minerals. The general phenomena of its winter differ nothing from the usual meteorology of the Arctic circle. From its vicinity to the magnetic meridian, the compass becomes here almost useless, remaining in that position in which it is placed by the hand.^c Were this pleasing confirmation of our theory of the obscure laws which govern the magnet the only fruit of the English expedition, it had not been undertaken in vain; but it has, besides, expanded the bounds of geographical knowledge; added greatly to the resources of the whale fishery;^d and, above all, it has thrown a new splendour over the nautical glories of Britain, and enhanced the dignity and value of human nature. It has proved that man, enlightened by the arts, is more than a match for the obstacles of nature in her wildest ferocity.

^d Ibid. 300, 301.

^e In Danish and Icelandic it is written *Grönland*, from *grön*, green, and *land*, land. It is improper to preserve the French orthography, *Groenland*, since it has become the source of a false etymology. *Groin*, in the ancient Scandinavian, corresponds with *crecens*, *germinans*, and not with *concreta*. Thus, Groinland, if such a word existed, would signify *terra germinans*, and not *terra concreta*.

^f *Hvit*, white; *serk*, shirt.

^g The Danish settlements in Greenland, (all on the W. coast.) are 22 in number, including the Moravian establishments.—*Giesecke*.—P.

Whether the two countries be united or not, the description of *Greenland*^g neither can, nor ought at present to be separated from that of America.

It will be hereafter shown, in the *History of Geography*, that the existence of the vast coast commonly traced opposite to Iceland, under the name of *Old Greenland*, rests on no better authority than an hypothesis of Torfæus, an Icelandic antiquary. This coast has, most likely, been always buried in the same ice which still prevents all access to it. The colonies of the Ancient Norwegians of Iceland were all situated to the west of Cape Farewell, which is the mount *Hvitserk*^f of these precursors of Christopher Columbus. Ancient Greenland corresponds with the part at present known and occupied by the Danes, and a tribe of Esquimaux. The Danish establishments consist of about twenty factories,^g scattered along the coasts, and divided into two inspectorships. The most advanced post towards the Pole is *Upernavik*, in 72° 30' N. latitude; and next to this are *Umanak*, *Godhavn*, on the island of Disco, *Jacobshavn*, *Holsteinborg*, *Sukkertoppen*, *Gothaab*, the principal and the oldest of these colonies, situated in 64° 10', with an excellent harbour; and, lastly, *Frederikshaab*, and *Julianeshaab*. The Moravian brethren have three settlements here, one of which, called *Lichtenau*, is situated quite close to Cape Farewell. The population which, in 1789, had been found to be five thousand one hundred and twenty-two persons, amounted in 1802, to five thousand six hundred and twenty-one; but this enumeration, made after an epidemic, was in other respects also incomplete.^h Vaccination, which has been recently introduced, will henceforth secure this people from the ravages of the small pox. It is only the coast, for an extent of three hundred leagues, that is inhabited; neither the Danes nor the Greenlanders having yet passed the chain of mountains which cut off their access to the interior. There are some wandering Greenlanders, however, who occasionally establish themselves at a considerable distance to the north of Upernavik, and who may be connected with the *Arctic Highlanders*, or northern Esquimaux, seen by Ross.^k

This country, in reality, is nothing more than a mass of rocks, intermingled with immense blocks of ice, thus forming at once the image of chaos and of winter. *Icy Peak*,^l an enormous mass of ice, rises near the mouth of a river, and diffuses such a brilliancy through the air, that it is distinctly perceived at the distance of more than ten leagues. Lofty spires, and an immense vault, give this edifice of crystal a most magic appearance. An uninterrupted chain of mountains traverses the part of Greenland with which we are acquainted. There are innumerable gulfs, but none of them advances towards the eastern coast.^m The three points called the *Stag's Horn*, is descried at sea at the distance of five and twenty leagues. The rocks are full of fissures, which, in general, are perpendicular, and are rarely more than half a yard in breadth, and contain a

^b Report on the present condition of Greenland, in the Danish Ministerial Gazette, 1803, Numbers 15 and 16.

ⁱ The present population of Danish Greenland is 6500.—Note of M. B.

^k The arctic Highlanders are said by Ross to have had no knowledge of any human beings but themselves, and to have never seen a boat or vessel, till they were visited by him. It is only the first clause of the sentence which belongs to the original, and it undoubtedly refers to the proper Greenlanders.—P.

^l "Pic de Glace." *Ice Blink*, *Pinkerton*—P.

^m Their general direction is N. E. and some of them reach to the central glacier, which cuts off all communication between the two coasts.—P.

great quantity of spar, quartz, talc, and garnets. The rocks are commonly composed of granite, clay slate,^a and potstone, arranged in vertical beds.^b The *Greenland Museum* at Copenhagen has received from this country a very rich ore of copper, schistus of the nature of mica, a coarse marble, and serpentine, together with asbestos, amianthus, crystals, and black schorl.^c Greenland likewise furnishes us with a new and curious mineral, the *fluatite of alumine*. A vast mine of sea-coal^d has been discovered in the island of Disco. Three hot springs are the only volcanic indications that have hitherto been observed. During the short season of summer, the air, which is very pure on the mainland, is obscured in the islands by fogs. The flitting glimmer of the aurora borealis, in some degree softens the gloomy horror of the polar night. What has been termed the frost smoke, is a vapour which rises from the crevices of marine ice. The rare occurrence of rain, the small quantity of snow, and the intense degree of cold produced by the east-north-east wind, lead us to suspect that the most eastern parts of Greenland form a great archipelago, incumbered with perpetual ice, which, for many centuries, has been piled together by the winds and currents.

There is some land that admits of cultivation; and probably barley might be made to grow in the southern part of the country. The mountains are covered with moss on the northern side, but the parts that have a southern exposure produce very good herbs, gooseberries, and other berries, in abundance, and a few little willows and birch. Not far from Julianeshaab, is a valley covered with birch; but the tallest of the trees are only eighteen feet high. Near the Danish colonies cabbage and turnips are cultivated.

Among the animal kingdom we meet with large hares, which are excellent eating, and afford a good fur; reindeer of the American variety, white bears, foxes, and large dogs, that howl instead of barking, and are employed by the Greenlanders in drawing their sledges. An immense number of aquatic birds live near the rivers, which abound with salmon. Cod, turbot, and small herrings, swarm in every direction in the sea. The natives have been supplied with nets, and now begin to experience their utility. In north or west Greenland, the Danes and natives go in company to the whale-fishing; but this tumultuous, and, to the natives, far from lucrative occupation, spreads vice and misery through this district.^e The natives of the south confine themselves to hunting the seal. The flesh of this animal is their principal food; its skin furnishes them with dress, and at the same time they construct their boats of it; thread is made of its tendons, and its bladder is converted into bottles; its fat is sometimes used as a substitute for butter, and at other times for tallow; and even the blood itself is considered by the Greenlander as excellent for making broth; in fact, he cannot possibly comprehend how any one can live without the seal, which, to him, is like the bread-fruit tree to the Otaheitan, or wheat to the inhabitant of Europe.

^a "Quelques pierres argileuses;" "some sandstone." (*Pinkerton*)—P.

^b Granite, gneiss, and mica slate, are the most abundant rocks in Greenland. Clay slate is rare. Porphyry, selenite, and primitive trap, are abundant in the southern parts, and flint trap covers the most northern part of the W coast, to 76° N occupying Disko Island, and the adjoining islands and shores.—*Giesecke*—P.

^c David Crantz's History of Greenland. Paul Egede's New Account of Greenland; Copenhagen, 1790.

The Greenland Company, established at Copenhagen, estimates its annual revenue at 140,000 rix-dollars, (20,000 to 25,000 pounds sterling;) and the exportations alone have amounted to 50, or 100,000 rix-dollars, without including the produce of the whale fishery. The expenses of the company are estimated at about 16,000 pounds Sterling.^f

The natives are of a very low stature, have long black hair, small eyes, a flat face, and a yellowish brown skin, evidently indicating them to be a branch of the Esquimaux or Samoiedes of America. This connexion is particularly proved by their language, which is also remarkable for the copiousness of its grammatical forms. The particles and inflections are as numerous and as varied as in the Greek; but the rule which directs them to incorporate all the parts of speech in the verb, gives rise to words of a disproportionate length. The consonants *r*, *k*, and *t*, predominate in this language, and produce, by their frequent repetition, very harsh sounds.^g It must be observed, however, that the Greenlanders of the north of Greenland speak a dialect almost unintelligible to the inhabitants of the south. Their dialect is named *Humooke*.^h The Greenland women, like those of the Caribs, employ words and inflections, which none but themselves are permitted to use. The Greenlanders sometimes call themselves *Innuak*, or *brothers*; but their true national name appears to be *Kalalit*, and they generally designate their country by the appellation of *Kalalit Nunet*.

The Greenlanders have not preserved any positive trace of a communication with the Scandinavian colony, whose establishments they invaded and destroyed. The sun, they consider to be a goddess or deified female, and the moon, a man, conformably with the belief of the Goths, which differed from that of the other Scandinavians; but as we find a God called *Lumus*, or *Mên*,ⁱ among even the classical nations themselves, this analogy either proves too much or nothing. As to ourselves, we have, on the contrary, recognised in the Greenlanders, a crowd of characteristic circumstances, which demonstrate their connexion with the Esquimaux, even with those that live at the remotest distances from them. The fishing implements employed by the inhabitants of Russian America, among others, are made exactly like those of the Greenlanders. Both of these people, too, make use of the bladder of the sea-dog, distended with air, and attached to the javelin with which they strike the whale, in order that it may thus serve to prevent the animal, when once he is wounded, from remaining any length of time plunged under water.^k A similar invention observed both at the eastern and western extremity of North America, must lead us unavoidably to infer an habitual communication between those distant tribes. The little boats used by the inhabitants of Oonashka, in Prince William's inlet, (the Tchugatchian Gulf of the Russians,) by the Esquimaux of Labrador, and the Greenlanders, are all precisely of the same construction, and resemble a box formed of slight branches, and covered on every side with the skin of the sea-dog. They are

twelve feet long, but only a foot and a half wide. In the middle of the upper surface there is a hole surrounded by a wooden hoop, with a skin attached to it, which admits of being drawn together like a purse, by means of a thong. It is in this hole that the rower places himself. Supplied with a single oar, which is very thin, three or four feet long, and becoming broader at each end, the navigator, or to speak more correctly, the man fish, paddling rapidly to the right and left, advances in a straight line across the foaming waves in the midst of the tempest itself, without incurring more risk than the whales and seals of whom he is become the companion and rival. This invention, which was admired by Captain Cook, and is adopted in part by the Norwegian and Danish pilots; could not possibly have made its appearance by mere chance under exactly the same form, among all the tribes of the northern extremities of America. These tribes, consequently, must have the same common descent, and must long have communicated together.^a

We shall seize this opportunity to explain a passage from the lost writings of Cornelius Nepos, which has been quoted, with some variations, by Pliny, and Pomponius Mela.^b "A king of the Suevi, according to the former, or of the Boii, according to the latter, made Quintus Metellus Celer, then Proconsul of Gaul, a present of some *Indians*, who," Mela asserts, "had been thrown by a tempest on the coast of Gaul;—having," as Pliny adds, "been thus hurried away by the storm, while engaged in a trading voyage in the Indian Ocean." The Romans concluded from this circumstance that, coming, as these savages did, from India, it was practicable to make the tour of Asia and Europe round the north, by traversing the imaginary ocean which, as they supposed, occupied the site of Siberia and of the north of Russia. To us, this explanation is inadmissible; but the fact still remains, that Indians, or dark-complexioned people of some nation or other, reached the coast of Germany or Gaul. In all probability, they were Esquimaux, either from Labrador or Greenland. The same circumstance again occurred in 1680 and 1684. Some Greenlanders arrived at the Orkney islands in boats, constructed in the manner which we have just described.^c They were mistaken for Laplanders, and, consequently, were called *Finn-Men*; but their boats, preserved in the College Museum at Edinburgh, and in the church of Barra, prove that they came from Greenland.

The present character of the Greenlanders is an indefinable mixture of good and bad qualities; while their attachment to their national customs, opposes the influence of foreign civilization. The Greenlanders bitterly accuse the Danes and other navigators of having brought among them the double scourge of small-pox and spirituous liquors. The present well-regulated Danish administration follows a plan of colonization calculated for establishing order and happiness; but the ancient defects and modern vices of the Greenlanders present great obstacles to the system. Almost entirely destitute of every idea of religion and of law, our religious worship appears, in their eyes, nothing

but a useless ceremony, while they look upon our criminal punishments as an unjust abuse of power. The malefactor appears to them to be sufficiently punished, when, in a public assembly, he is loaded with reproaches. The missionaries confess, that the conversion of the Greenlanders advanced slowly, and exerted but little influence over their moral ideas. For some years back, however, the preaching of natives educated as missionaries, has been productive of a happy change. The Moravians have also succeeded in a remarkable manner in engaging the affections, and reforming the conduct of this simple people, who are gifted with considerable quickness of perception. Commerce, by introducing coin and even paper money, has given them new notions with regard to property. In the southern part of the country, they have been taught to make barrels, and construct boats.^d The name of their ancient divinity, *Torngarsuk*, to whom they never offered any worship, is already forgotten, as well as the malevolent goddess, without a name, who was supposed to inhabit a palace at the bottom of the sea, guarded by terrific sea-dogs.^e Even a kind of philosophy has introduced itself among them, and various new opinions exist concerning a future state and the transmigration of souls. The free-thinkers of Greenland will not admit the prevalent belief that there is a paradise, where the soul, in a state of happy indolence, is nourished with the heads of sea-dogs.^f The priests and sorcerers, called *Angekok*, and the malevolent enchanters, denominated *Ilseets*, are daily losing their influence. Perhaps the period may not be far distant, when the sublime devotion of the virtuous Egede will meet with its reward, and a Christian and civilized people will at length inhabit this memorable colony, the most northern that Europeans have ever established. A mild and pure glory will then recompense Denmark for the pecuniary sacrifices which this struggle with the elements has cost her, a struggle into which she has been drawn by a pious zeal, and the influence of historical recollections.

The same recollections accompany us to that wonderful island, which, although it was known seven centuries before the time of Columbus, is, nevertheless, a natural appendage of the New Continent. Our readers will readily understand that we allude to Iceland, that land of prodigies, where the subterraneous fires of the abyss burst through a frozen soil; where boiling springs shoot up their fountains, amidst eternal snows; and where the powerful genius of liberty, and the no less powerful genius of poetry, have given brilliant proofs of the energies of the human mind at the farthest confines of animated nature.

We were long indebted for our acquaintance with the geographical situation of Iceland, to the observations of obscure authors, made in the middle of the seventeenth century, or, perhaps, even merely copied by Torfæus from some imitation of the *Carta di Navegar* of the brothers Zeni, which was drawn up in the fourteenth century. To these were adapted the otherwise accurate results of the survey of the military engineers completed in 1734. Such were the discordant elements of the map of Iceland, which was

^a Still, it must be remarked, that this, and every other nautical artifice, is quite unknown to the aboriginal Esquimaux of Prince Regent's Bay. Ross, I. p. 175.—Tr.

^b Plin. Hist. Nat. lib. II. cap. 67. Pomp. Mela, III. 5. Vossius reads *Bacti* for the name of this nation, and thinks them *Butari*. Other MSS. read *Lydi*, and the *Lygdi* are mentioned by Tacitus and Cluverius as a Suevian tribe; as also the *Boii*. The latter dwelling nearest the Helvetic territory, probably made the present of these foreigners

published by the Homanns, and became, with some slight corrections, the origin of all the rest.^a But, in 1778, Messrs. Borda, Pingré, and Verdun de la Crenne, after having at first sought in vain for Iceland, floating, as it were, like Delos, on the ocean, determined astronomically several principal positions, some of which were placed three or four degrees too far to the west. The superficial extent of the island, which, according to the old maps, had been estimated at 8000 square leagues, was reduced, in consequence of their measurement, to 4500.

Iceland, that is to say, the country of ice, strictly speaking, is nothing but a chain of immense rocks, the summit of which is covered with perpetual snow, although fire burns within their subterranean caverns. Trap and basalt appear to predominate in the structure of these mountains. The basalt forms immense masses of pillars, similar to those of Giant's Causeway in Ireland. Mount Akrefell contains beds of amygdaloid, trap-tuff, and greenstone, the lower surface of which has evidently been subjected to the action of a very strong fire, but under powerful pressure, probably at the bottom of the primitive ocean.^b Several formations of lava are noticed, one of which has flowed, and often still flows, in the form of blazing torrents, which issue from craters; another kind, of a spongy, and, as it were, a cavernous nature, appears, if we may use the expression, to have boiled up in the very place where it is found.^c This last mentioned lava contains in its numerous cavities the most singular stalactites. There are about twelve volcanoes in Iceland, with the eruptions of which we are acquainted, not reckoning those which may have become extinguished before Iceland was inhabited. The most celebrated of these volcanoes is *Mount Hecula*, situated in the southern part of the island, at the distance of about a league and a quarter from the sea. Its elevation is estimated at 4800 feet above the level of the sea. The volcanoes of *Skaptaafell* made themselves known in 1783, in a terrific manner. The river *Skapt-Aa* was completely filled with pumice stones and lava; a fertile district was instantly changed into a desert covered with scoria: sulphurous exhalations and clouds of ashes spread themselves over almost the whole island; and an epidemic was the consequence. No phenomenon, however, better proves how immense the mass of volcanic matter must be, than the sudden appearance of a new island,

^a The following are the changes which Iceland has undergone in the maps of the eighteenth century.

	N. lat.		Long.		
	deg. min.	deg. min.	deg. min.	deg. min.	
Homanns' Map	63 19	to 67 17	348 22	to 2 12	from Ferro.
Horrebow's do.	63 14	to 67 14	331 0	to 345 11	from Oxford? (346 25 to 1 36 from Ferro.)
General History of Voyages, do.	63 15	to 67 18	36 6	to 22 6	from Paris. (343 54 to 357 54 from Ferro.)
Verdun de la Crenne's do.	63 13	to 66 45	27 2	to 18 14	from Paris. (352 58 to 1 36 from Ferro.)

It is remarkable that Horrebow, if, as we suppose, he has calculated from the *meridian of Oxford*, should have correctly laid down the position of this eastern coast. It is probable, in fact, that he must have had before him either the map or observations of some English navigator, whose name has remained unknown.

The map of the brothers Zeni gives all the latitudes too high; but as it allows Iceland only nine degrees in longitude, it approaches within *half a degree*, nearly, of our modern maps. Even the figure of the island is good, with the exception of the N. W. peninsula, with which the Zeni were unacquainted.

This uncertainty with respect to the geographical position of Iceland, naturally extended to the adjacent coast of Greenland; and so late as June, 1822, a correction of 5° to 10° of its western longitude,

which, shortly before the eruption of 1783, rose up to the south west of *Reikianess*, in 63° 20' latitude, and 5° 40' west longitude. This island threw out flames and pumice stones; yet, in 1785, when a search for it was made, it had entirely disappeared. It is probable, therefore, that this island was nothing more than a crust of lava and pumice stones, raised to the surface of the sea by a submarine eruption.^d

The hot springs are another curiosity in this island, but they have not all the same degree of heat. Those, whose tepid waters issue as gently as in ordinary springs, are called *Laugar*, or baths; others, that throw up boiling water with great noise, are denominated *Caldrons*, in Icelandic, *Hverer*. The most remarkable of these springs is that called the *Geysir*, which is found near Skalholt, in the middle of a plain where there are about forty other springs of a smaller size. Its mouth is nineteen feet in diameter, and the basin into which it spreads itself thirty-nine. Archbishop Von Troil saw this spring rise to the height of eighty-eight feet; and Dr. Lind to that of ninety-two. This column of water, surrounded by a dense smoke, falls back upon itself, or forms a magnificent girandole. A new spring has lately appeared which rivals the Geysir. It is called the *Strok*. The aperture from which it springs is of a smaller diameter, but it shoots up with more force than the Geysir presents a better defined surface, and reaches a much greater elevation; and is then dispersed in the air like our artificial fountains.^e Two other springs rise and fall alternately. The whole of this infernal valley is filled with springs, and surrounded with lava and pumice stones. These boiling waters, and principally those of the Geysir, deposite round their edges a crust of siliceous tuff.^f In these hot springs, which formerly served to baptize their pagan ancestors, the Icelanders boil their vegetables, meat, eggs, and other articles of food; but it is necessary to cover with care the pot suspended in these smoking waters, in order to prevent the volcanic odour from given a taste to the victuals. They likewise wash their linen in them, and by means of the heat, give a curve to several implements of wood. The more temperate springs are employed as baths. The cows that drink of these waters give an extraordinary quantity of milk.

Besides these magnificent fountains, Iceland likewise contains mineral springs, which the inhabitants call the *beer*

was made by the indefatigable Captain W. Scoresby. In his ship *Baffin*, he explored this almost forgotten shore, from lat. 69° to 75° north; and besides that sound named *Scoresby*, which is supposed to communicate with Jacob's Bight, within Davis's Straits, he found the line of coast, like that on the western side, intersected by frequent inlets, of which the chief are *Davie's Sound*, *Mountmorris' Inlet*, *Mackenzie's Inlet*, *Scott's Inlet*. Three islands, *Liverpool Coast*, *Canning*, and *Bontekoe*, are situated at a short distance from the land, itself now removed 5°, 10°, and 15°, farther to the westward—See *Scoresby's Voyage, Chart*.

^b Mackenzie's *Travels in Iceland*, Edinburgh Review, vol. XIX. p. 432—434. [Mackenzie states that this mountain is composed of alternating beds of amygdaloid and tufa, and that the above appearance on the lower surface commences only at the height of 800 feet, above which all the beds, except those of tufa, present the same appearance. The greenstone occurs in a vein, about 4 feet thick, cutting these beds, and having a vitreous coating on its sides.—P.]

^c "This is supposed to be formed of rocks which have been subjected to subterranean heat, but not removed from their original place."—*Mackenzie*.—P.

^f Bergmann, in the Letters on Iceland, by Von Troil.

springs, a denomination which appears to prove that they have not always neglected the use of them as they do at present

One of the most singular productions of Iceland is that blackish, heavy, and inflammable substance, called, in Icelandic, *surturbrand*,^a which is a fossil wood, slightly carbonized, and burns with flame. Another kind of mineralized wood, heavier than sea-coal, burns without flame, and contains chalcidony in its transverse fissures.^b

The central mountains of Iceland, probably of a primitive nature, contain iron and copper, which are not worked, for want of fuel; likewise, marble, lime, plaster, porcelain clay, and several kinds of bole, besides onyx, agate, jasper, and other stones. Sulphur is also found, both in a pure and impure state. The mines of Krisevig and Husavig are the most considerable. A manufactory for refining sulphur has been established in the latter place. The sulphur hills present a more frightful, and a more instructive phenomenon, than the Geyser. Under your very feet you see the clay continually bubbling up, and hear the din of waters boiling and hissing in the interior of the mountain, while a hot vapour hovers above the ground, from which columns of muddy water frequently shoot up. The sulphur, which forms the crust of these beds of clay, is generally very hot, and is met with under the most beautiful crystalline forms.

Iceland produces no salt; but the water of the surrounding sea is fully as saline as that of the Mediterranean. The salt which they obtain from it gives a blueish tint to fish.

The atmosphere of Iceland also displays its prodigies. Through an air, which is filled with little icy particles, the sun and moon appear double, or assume extraordinary forms; the aurora borealis reflects a thousand different colours, and every where the magical illusion of the *mirage* creates phantom seas and imaginary shores. The ordinary climate would be sufficiently temperate to admit of the cultivation of grain, which was formerly sufficient for the wants of a much more considerable population. The government takes great pains to revive it. But when the floating ice fixes itself between the northern promontories of this island, all farther hope of cultivation for one or two years entirely ceases, a frightful degree of cold diffuses itself through the whole island, the winds bring with them complete columns of icy particles, vegetation is entirely destroyed, and famine and despair appear seated upon those mountains, which in vain are heated by all the fires of their subterranean abysses.

Within the space of one century the inhabitants reckoned forty-three bad seasons, among which there were fourteen years of famine. In 1784 and 1785, when an intense severity of winter succeeded volcanic eruptions, 9000 individuals perished, or one-fifth of the entire population, with 190,488 sheep, 28,000 horses, and 11,491 horned cattle.^c

The *Elymus arenarius*, in Icelandic, *melur*, is a species of wild wheat, which affords good flour. The *Lichen Islandicus*, and several other species of lichens, are used as food, as well as a great number of antiscorbutic roots, and

even several kinds of marine plants, and, amongst others, the *Alga saccharifera*, and the *Fucus foliaceus*. Iceland produces, like Norway, an immense quantity of wild berries of an excellent flavour. Gardening is now practised over the whole country. Cauliflowers, however, do not succeed. The cultivation of the potato has not made sufficient progress for the advantage of the island. In former times, the southern valleys were covered with extensive forests, but they have been devastated by an improvident economy. At present, nothing more is seen than a few woods of birch trees, and a great deal of brushwood. But the wood which is denied to the Icelanders by the land is brought to them by the ocean. The immense quantity of thick trunks of pines, firs, and other trees, which are thrown upon the northern coasts of Iceland, especially upon North Cape, and Cape Langaness, is one of the most astonishing phenomena in nature. This wood comes floating down upon these two points of land in such abundance, that the inhabitants neglect the greater part of it. The pieces which are carried by the waves along these two promontories, towards the other coasts, supply a sufficient quantity for constructing their boats.

The horses are of the same species as those of Norway, and are employed, like asses, to carry loads. The oxen and cows are generally without horns, but the sheep, on the contrary, have two, and sometimes three, are very large, and have longer wool than the common Danish sheep. Iceland has contained as many as 400,000 sheep, and nearly 40,000 horned cattle.^d The pastures, if better attended to, would constitute the true riches of the island; but they are left in a state of nature.

Government has brought the rein-deer to Iceland, and it has multiplied there. It is remarkable that this animal was not originally a native of the country, considering that the rein-deer moss grows there in great abundance. The foxes of Iceland furnish beautiful furs. Skins of a grayish colour are sometimes sold at Copenhagen for thirty or forty shillings. This is the only wild quadruped of Iceland. The white bear, which sometimes reaches these shores, floating upon islands of ice, now and then commits ravages before he is destroyed. Among the birds of Iceland, the eider duck, *Anas mollissima*, is celebrated for its down. The falcons of Iceland were formerly in greater request than they are at the present day. The white falcon,^e which is rarely met with, is worth from three to four pounds sterling.^f The king of Denmark sometimes makes presents of them to different courts.

The sea and rivers offer advantages to the Icelanders, of which they are too negligent. The salmon, trout, barbel, and other excellent fish, with which the rivers swarm, are generally permitted to live and die undisturbed. Eels are likewise very abundant; but the inhabitants are afraid of eating them, fancying, that in them they see the offspring of the great sea serpent, which, according to the mythology of Odin, encircles the whole earth, and which the Icelanders pretend to have seen lifting its head above the sea, near their solitary shores. The coasts are surrounded with herrings; but it is only lately that the inhabitants have

^d In 1770, Iceland was estimated to contain 491,934 sheep, and in 1703, 35,860 horned cattle. In 1804, there were 218,818 sheep, and 20,325 horned cattle; population, 46,439.—Stephenson.—P.

^e Falco Islandicus.

^f "90 to 100 francs."

become acquainted with the use of nets. Small whales, and the sea-calf and sea-dog,^a together with the cod,^b are what the natives most commonly fish for.

Iceland is divided into four quarters or provinces, named after the four cardinal points. Those of the south, the east, and the west, formed the diocese of *Skalholt*. The diocese of *Holum* comprised the northern quarter; but, since 1801, the two bishoprics have been united. New sites have been marked out for founding other towns. That of *Reikiavik* contained, a short time ago, about a hundred houses, and constitutes the present capital of the country. *Bessestadr* is the seat of a good academy, with a collection of 1500 volumes, which is no doubt one of the most northern libraries in the world.

The commerce of Iceland, formerly shackled by monopoly, is now free. The inhabitants export fish, train-oil,^c meat, tallow, butter, hides, eider-down, wool, woollen yarn, and coarse woollen stuffs. Their importations consist of wheat, grain, brandy, tobacco, colonial merchandise, fine stuffs, and articles of hardware. The value of this commerce is liable to considerable variation.

In 1784, the exportations amounted to 244,422 rix-dollars, and their importations to 189,492 rix-dollars.^d In 1806, the exportations were estimated at 191,236 rix-dollars, and the importations, at 167,205 rix-dollars.^e

Let us now proceed to consider the interesting people who inhabit this singular country. The Icelanders are, in general, of a moderate stature, and well proportioned; but as their food is neither nourishing nor abundant, they are by no means vigorous. Their marriages are not attended with a numerous offspring. They are by no means industrious; but honest, benevolent, faithful, and obliging, these generous islanders display all the hospitality which their means can afford. Their principal occupations consist in fishing and taking charge of their flocks. Along the coasts, the men continue fishing, both in summer and winter. The women dress the fish, and sew, and spin. The men prepare hides, and exercise the mechanical arts. Some of them work in gold and silver. They also manufacture, like the peasants of Jutland, and several other provinces, a kind of coarse cloth, known by the name of *Wadmal*. They manufacture annually 146,000 pairs of woollen stockings, and 163,000 pairs of gloves.^f These islanders are so attached to their native country, that they are wretched every where else. Naturally grave and religious, they never cross a river, or any other dangerous passage, without uncovering their head, and imploring the Divine protection. When assembled together, their favourite amusement consists in reading their historical relations, or compositions of their ancient bards. The master of the house begins, and the others take his place by turns.^g At other times, modern poetry^h is read aloud.ⁱ Sometimes, one of the men gives his hand to a woman, and they sing couplets alternately, that form a kind of dialogue,^k the rest of the company now and then joining in the *chorus*. The game of chess is very much in vogue amongst them, and, like the ancient Scandinavians, they feel great pride in playing it

^f Mohr and Olavius Travels in Iceland, (in Danish.)

with skill. The dress of the Icelanders is neither elegant, nor very much ornamented; but, on the other hand, it is decent, clean, and adapted to the climate. The women wear rings of gold, silver, and copper, on their fingers. The poorer among them are dressed in the coarse stuff which we have already noticed; and which is always of a black colour. Those who enjoy greater ease of circumstances, are clothed in more ample stuffs, and wear ornaments of gilt silver. The Icelanders are in general badly lodged. In some places their houses are constructed of the wood which has been thrown up by the sea; and sometimes the walls are made of lava and moss. They cover the roof with sods, placed on joists, and occasionally upon the ribs of whales, which are more durable, and less expensive than wood. Many of their huts are made entirely of sods, and are lighted by a window in the roof. Their principal food consists of dry-fish, and preparations of milk. They are sparing of their animal food, and formerly, bread was scarce. At present, however, 18,000 tons^l of rye are consumed in the island. The wealthy know the use of wine, coffee, and all the spices of our kitchen. A more useful imitation of the Danish manners has led to the establishment of several literary societies here, some of which have published memoirs. The parishes, too, have begun to form little public libraries, from which the heads of families borrow books of morality and history. Every Icelander knows how to write, and to calculate; and the greater part of them are acquainted with biblical history, as well as that of Scandinavia. Among their clergy, many individuals are met with, who are intimately versed in all the beauties of the Greek and Roman literature. The useful study of the physical sciences, however, has not been diffused amongst them.^m Such is this colony of Scandinavians, placed between the ice of the pole and the flames of the abyss.

To the north-east of Iceland, extend coasts still imperfectly known, which belong either to Greenland, or to an icy Archipelago. They have only been accidentally seen by navigators, who, in pursuing the whale, penetrated into these dangerous seas. Concussions lately experienced at sea, and masses of floating pumice-stones, appear to indicate the existence of volcanoes in about 75° N. Would the hot springs be discovered here, which, according to the brothers Zeni, were employed to heat the monastery of St. Thomas?ⁿ The island of *Jan Mayen*, which has been often visited, is nothing more than a mass of black coloured rocks, but without any volcanic traces.

The group of three large islands, and of a considerable number of lesser ones, which have received the name of *Spitzbergen*, terminate, in the present state of our geographical knowledge, this chain of icy lands, which are dependant on Greenland, and, consequently, on North America. The great island of *Spitzbergen*, properly so called, is separated by narrow channels from the *south-east* and the *north-east* islands. The eastern peninsula of the great island, has received the name of *New Friesland*. Towards the north-west point, are the remains of the establishment

ⁿ Hist. de la Geog. p. 400.

formed by the Dutch whalers, called Smeerenburg.^a The mountains of Spitzbergen, crowned with perpetual snow, and flanked with glaciers, reflect to a considerable distance a light equal to that of the full moon. These mountains are probably composed of red granite; the blocks of which, being in a great measure uncovered, shine like masses of fire, in the midst of the crystals and sapphires formed by the ice. In consequence of their enormous elevation,^b they may be descried at a great distance; and, as they shoot up abruptly from the bosom of the sea, the bays, vessels, whales, every thing, in short, appears in their vicinity, extremely minute. The solemn silence that reigns in this desert land, increases the mysterious horror which the navigator experiences on his approach. Nevertheless, the death of nature is even here only periodical. One uninterrupted day, of five months' duration, supplies the place of summer. The rising and setting of the sun mark the limits of the vivifying season. Yet, it is only towards the middle of this season, or, if the expression be preferred, towards the noon of this protracted day, that the heat, long accumulated, penetrates a little way into the frozen earth. Although pitch on vessels is melted with the rays of the sun, still only a small number of plants expand, such as the cochlearias, ranunculuses, and sedums.^c Martens even gathered a chaplet of poppy flowers along these gloomy shores. The gulfs and bays are filled with fuci and algæ of gigantic dimensions, one species being two hundred feet in length. It is among these marine forests that the seals and whales love to roll their enormous bodies, those vast masses of fat, which the fishermen of Europe pursue even to the very middle of eternal ice. It is there that these animals search for the mollusca and little fish, their accustomed nourishment. It is there, in short, that these beings, to all appearance so heavy and so insensible, yield themselves up to their social dispositions, their sports, and their loves. Assembled together upon a field of ice, the sea-dogs dry their brown-coloured hair; the *morse*, or *hvalross*,^d fastening himself to the rocks, displays his enormous tusks, the brilliant ivory of which is concealed under a layer of sea-slime; while the whale blows through his vast nostrils,^e fountains of water into the air, and resembles a floating bank, upon which various crustacea and mollusca fix their abode. This peaceful animal, however, is often mortally wounded by the *narhval*,^f which has received the name of the *sea-unicorn*, from being generally found deprived of one of its horizontal tusks. The whale is also frequently the victim of a species of dolphin, called the *sword-fish*,^g who tears out pieces of flesh from his body, and particularly endeavours to devour his tongue. Among all the colossal monsters of the icy sea, one formidable, voracious, and sanguinary quadruped, the polar bear, claims the first rank.

^a In English, the castle of fat, or fat castle.

^b Above the clouds.—Phipps' Voyage to the Polar Seas.

^c "Joubarbe," *Sempervivum*.

^d *Morse* is a corruption of the Russian adjective *morshaiu*, maritime. *Hvalross*, is both Icelandic and Danish, from *hval*, a whale, and *ross*, horse; whale-horse. The word *hval*, seems to be derived from *hval*, a little hill, a rising ground, or, as if one were to say, fish-mountain. (Comp. *Niala Sagu*, *glossarium* in voce *hval*.)

^e "Events," blow-holes, spout-holes; these are not organs of smelling, but merely passages for respiration, and for ejecting the water received with their food.—P.

^f *Narhval*, from *nar*, Icelandic, dead body, and *hval*; whale-killer.

^g *Delphinus gladiator*, "épée de la mer;" sea-sword.—P.

^h Martens' Voyage to Spitzbergen and Greenland, Hamburg, 1675, in 4to. and the translations in the Voyages au Nord. Bacstrom, Voyage to Spitzbergen, in the Philosophical Magazine, 1801.

At one time borne along upon an islet of ice, and at another, swimming in the midst of the waves, he pursues every thing that is animated with life, devours every animal that he encounters, and then, roaring with delight, seats himself enthroned on the victorious trophy of mutilated carcasses and bones. Another quadruped, the timid and amiable rein-deer, browses the moss with which all the rocks are covered. Troops of foxes, and countless swarms of sea birds, likewise repair hither for a little while, to people these solitary islands; but, as soon as the polar day is over, these animals retire across unknown countries, either to America or to Asia.^b

The marine animals of Spitzbergen present to the cupidity of Europeans, an attraction which makes them forget the dangers of these inhospitable seas. The whale fishery, mentioned in the ninth century, has often given employment to as many as four hundred large vessels, of all nations. The Dutch, within the space of forty-six years, caught 32,900 whales, the whale-bone and oil of which were worth fourteen millions sterling.^{i,k} In the present day, however, these animals appear to frequent the seas of Spitzbergen in fewer numbers, and are no longer met with of the same dimensions as at the commencement of the fishery. The *morse* is more numerous, and easier to attack. Its skin, made use of for suspending carriages, and its teeth, more compact than those of the elephant, are objects that occasionally attract to Spitzbergen temporary colonies of Russians. The ancient Britons, even before the Roman invasion, made their sword-pumells of this bone.^l The ancient Scandinavian colony of Greenland, paid in '*dentes de roardo*,' which appear to have been the tusks of the *morse*, the tribute which, under the name of *Saint Peter's pence*, flowed from the farthest extremities of the earth, to support the magnificence of the Roman churches, and the pomp of the Papal court.^m The horn of the *narhval* has long been the object of superstitious veneration; pretended universal remedies were obtained from it; and it was hung up in the museums with chains of gold. The Margraves of Bareuth ordered several of them to be preserved among the treasures of their family. They had even accepted of one of them as payment of a sum amounting to more than sixty thousand rix-dollars. The two branches of this horn divided between them one of these horns, with as many formalities as they would have employed for the division of a whole fief.ⁿ In the present day, however, physicians have abandoned this panacea, and the *veritable unicorn*,^o has lost its imaginary value. Another substance, the original product of these regions, has likewise been the subject of some fables. We allude to the cerebral matter^p of the *cachalot*, very improperly denominated *spermaceti*, but more appropriately, *whale's*

^o Genuine unicorn.

^p The spermaceti is a peculiar kind of fat, found in almost every part of the body of the *physeter*, mixed with the common fat, but in greatest quantity, and most distinct, in certain cells within the substance of the cranium, particularly in the upper part; hence it was erroneously considered by the older naturalists as the brain or cerebral matter of the animal.—P.

white.^a In the north, candles of a brilliant white are made of it.^b All these enormous animals, however, are far less useful to man than the herring, of which the icy sea appears to be either the native abode or the asylum. There, in the midst of inaccessible waters, he sets at defiance all his enemies. Unknown causes, however, drive him from this secure retreat, to the northern coasts of Europe and America, which he surrounds with his countless shoals.

The extreme abundance of floating wood, which is brought by the sea to the shores of Labrador and Greenland, and especially to those of Iceland and Spitzbergen, and the arctic lands situated between these two islands, forms another, and the last object of curiosity that deserves to arrest our attention among these polar regions. We are assured that the masses of floating wood thrown by the sea upon the island of Jan Mayen, often equal the whole of this island in extent.^c There are some years, when the Icelanders collect sufficient to serve them for fuel. The bays of Spitzbergen are filled with it, and it accumulates upon those parts of the coast of Siberia that are exposed to the east. It consists of trunks of larch trees, pines, Siberian cedars, firs, and Fernambuco and Campeachy woods.^d These trunks appear to have been swept away by the great rivers of Asia and America. Some of them are brought from the Gulf of Mexico, by the famous Gulf Stream, while others are hurried forward by the current, which, to the north of Siberia, constantly sets from east to west. Some of these large trees, that have been deprived of their bark by friction, are in such a state of preservation as even to form excellent building timber.^f But if a part of this floating wood proceed from forests that are still actually in existence, another part appears to us to have a more remote origin, and to be connected with the great revolutions of the globe. We have already seen, in our *Physical Geography*,^g that extensive deposits of coal, of bituminous wood, and of overturned trees, are extended indiscriminately under the surface of continents and seas. This vegetable wreck must belong to several catastrophes, to re-

peated devastations of the solid land. The whole extent of the globe has experienced similar revolutions, and even the Polar Regions present traces of them. In Iceland, besides the fossil bituminous wood, another kind is also found in the earth, which has only undergone a change of colour, odour, and solidity, sometimes a flattening, but with no appearance of mineralization. This wood is met with in argillaceous and sandy ground, at the height of some fathoms above the present level of the ocean, while the deposits of turf and bituminous wood, most generally commence at twenty-five fathoms above this level, and rise even to a hundred fathoms.^h In the same manner, we find, in Siberia, great masses of wood deposited at elevations which the present sea could never have reached.ⁱ Some philosophers have imagined, that in these facts, they perceive a new proof of the diminution of the sea, these deposits proceeding, according to them, from floating wood of an epoch anterior to this diminution. Without wishing altogether to reject this opinion, we ourselves rather consider them as the remains of forests, which were overturned in the very places where they originally grew. If we admit that the bottom of the sea in many places presents to the action of the waves similar deposits of buried forests, that once belonged to continents which have been overwhelmed during the great revolutions of the globe, we may conceive that a greater or lesser quantity of wood must be detached from them, according as the action of the waves is stronger or weaker at any particular point. Now, this action, always very superficial, takes more effect in the shallowest seas, such as are all those of the north. It appears to us, therefore, that a great part of the polar floating wood ought to be considered as the vegetable wreck of great continents, which, crumbling into the basin of the sea, have yet allowed the waters, on retiring, to leave our present land uncovered.

This conjecture may, perhaps, merit the consideration of those who shall, one day or other, direct their scientific attention to the mysteries of that Polar world, a sketch of which we have now completed.

BOOK LXXVIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Canada, Nova-Scotia, and Newfoundland.

AFTER having surveyed the frozen zone of the new world, we enter a country of a milder climate, where men, by means of agriculture, have been enabled to form themselves into more numerous societies. Although the soil is less sterile, it has still many disadvantages; and its inhabitants appear to have hitherto made but little progress in civilization. In ascending the River St. Lawrence, we observe the majestic forests of Canada expanding round the greatest lakes that exist in the world. The river itself may be considered as a strait, which affords a passage to these immense bodies of water. To the largest of these lakes, our earliest travellers have given the name of Lake Superior.^{a b} It is more than 500 leagues in circumference; its clear waters, fed by forty rivers, are contained in extensive strata of rocks, and their surges nearly equal those of the Atlantic Ocean. Lake Huron, which has a periphery of 300 leagues, receives the waters of Lake Superior through the Straits of St. Mary, by a series of rapid descents.^c The outline of Lake Michigan is supposed to be about 200 leagues; it communicates with Lake Huron by a broad strait, which serves as an outlet for its waters, and the country around its banks belongs exclusively to the United States. Lake Huron discharges itself into the rapid river of St. Clair, which, by the accession of other streams, is changed into a small lake of the same name.^d A less violent channel, properly called the Detroit,^e unites this basin with Lake Erie, which is more than ninety leagues in length, and about twenty or thirty broad. On account, however, of its shallow waters, and the unequal elevation of its banks, it is subject to storms, which render navigation dangerous. This lake communicates with the River Niagara, and with those celebrated cataracts, of which so much has been written, although no description can convey an adequate idea of their awful sublimity. We may remark, that the western fall is the greatest; the river in this place is more than 600 yards wide, and the perpendicular height of the descent is upwards of 142 feet. The eastern or American cataract, is 350 yards in breadth, and 163 feet high. It is separated from the western by Goat Island, which extends about half a mile upward from the precipice, and has a sand bank, by means

^a Sagard Th  odat, le Grand Voyage du pays des Hurons, p. 259. Paris, 1632.

^e "Le Detroit," the Strait; in English, Detroit River.

^f Goat Island presents toward the north a perpendicular front of bare solid rock, nearly on a line with, and of the whole height of the cataract. It is connected with the New-York shore by a bridge.—P.

of which, in seasons of low water, the island may be approached from the eastern shore.^f It is now accessible by a bridge thrown over a little above the American fall. Goat Island contains about eight acres^g of good land.^h These great cataracts are continually obscured with vapour, which may be distinguished at a very considerable distance; and their foaming billows appear to float in the heavens. As the density of the mist varies, the adjacent forests and rocks are occasionally perceived, and they add to the splendour of the scene. The effect produced by the cold of winter on these sheets of water, thus rapidly agitated, is at once singular and magnificent. Icicles of great thickness and length are formed along the banks from the springs which flow over them. The springs impregnated with sulphur, are congealed into transparent blue columns. Cones are formed by the spray, particularly on the American side, which have large fissures disclosing the interior, composed of clusters of icicles, similar to the pipes of an organ. Some parts of the falls are consolidated into fluted columns, and the streams above are seen partially frozen.ⁱ

The River Niagara descends by this splendid porch into Lake Ontario, whose tranquil waters are subject to phenomena resembling those of the tides. This lake is nearly 170 miles long, and sixty broad at its widest part.^k It empties itself, through the romantic Lake of the Thousand Islands, into the St. Lawrence. The scenery along the banks of that great river, in the vicinity of Montreal, is wild and picturesque. The traveller observes numerous villages, while he doubles the little promontories that are covered with woods; the houses seem to be placed on the water, and the tin-covered steeples reflect through the trees the rays of the sun. Views of this description are varied and repeated almost at every league.^l After having passed Quebec, the St. Lawrence becomes so much enlarged, and its banks are so far distant from each other, that it resembles a gulf rather than a river.

The Ottawa is the only other considerable river of Canada; it unites its blue^m and transparent waters with those of the St. Lawrence. It forms, among other picturesque cascades, that of the Chaudiere.ⁿ The Saguenay, which flows from the north, is the outlet of Lake St. John. The

^l *Weld, Voyage dans le Canada*, t. II. p. 210, &c. &c.

^m "Verd  tre," greenish.

ⁿ The fall on the Ottawa, called the *Chaudiere* (cauldron) and the falls of the Chaudiere, on the river of the same name, a few miles above Quebec, should not be confounded. The river Chaudiere rises in the height of land which separates the waters of the Atlantic from those of the St. Lawrence, into which it flows six miles above Quebec. —P.

River Sorell runs almost in a straight line northwards; it is the outlet of Lake Champlain; by being made navigable, it would afford a most convenient means of commercial intercourse with the interior of New-York, and form a direct chain of communication with the great western canals. Among the lesser rivers, that of Montmorenci is celebrated on account of its cataract. This stream forces twice a passage for itself through precipitous rocks. The rapidity of its current is augmented, as its channel is gradually contracted within the breadth of a hundred feet, when the river falls almost perpendicularly in white clouds of rolling foam, from a rock 246^a feet high—the spray resembling in its descent flakes of snow that are whirled into the profound abyss. Clouds of vapour arising, and assuming the prismatic colours, are bounded by naked rocks of gray limestone, which form the contours of a more varied, although perhaps of a less striking landscape, than that at the Niagara.^b

Canada is not divided by any great chain of mountains, but it rises gradually^c towards the interior. The cataracts indicate the changes in the level of its waters; and the dividing line between the waters of Hudson's Bay and the River St. Lawrence, is marked only by a series of isolated hills and rocks. The extremes of cold and heat are excessive; the range of the thermometer has been calculated from a hundred and two degrees of Fahrenheit to thirty-six below zero in the same scale.^d Frost begins in October, but the heat of the sun still keeps the weather tolerably warm during the day. In the following month the cold increases, one snow storm succeeds another, until the whole face of the country is covered, and the eye looks in vain for a single spot of verdure. These storms are accompanied with violent hurricanes, which proceed commonly from the frozen regions of Hudson's Bay and Labrador. Europeans cannot remain long in the open air at this season,^e without experiencing the painful effects of an intense winter. At Quebec the sleet and snow frequently freeze as they beat against the faces of the people that are walking along the streets. Large masses of snow, drifted in several places above the height of a man, hinder the inhabitants of that city from communicating with each other. This weather continues with little interruption until the middle of December, when the boisterous storms are followed by a more serene sky and by a colder atmosphere. All the rivers become suddenly frozen; even the St. Lawrence is impeded in its course, and its banks are surcharged with islands of ice. The settlers on the southern bank bring over their provisions to supply the market at Quebec. As the river is rarely completely frozen, they use their canoes as sledges along the large heaps of floating ice. These immense masses are hurried down the stream with prodigious velocity, about the end of April, and, in some late seasons, not before the beginning of May. The breaking of the ice is accompanied with a loud noise like the report of a cannon. The lake ice comes down in great quantities for several days, and carries along with it the roots and branches that are torn from the islands and shores in the course of its descent.^f Spring

and Summer are confounded with each other, and the sudden excess of heat renders the progress of vegetation almost perceptible. September is the most agreeable month in the whole year.^g

Canada is nearly covered with forests, and the cultivation of the ground does not extend far beyond the banks of the St. Lawrence. The extensive chain of farms along the sides of that river has the appearance of one immense town. Corn fields, pasture, and meadow lands, embellished at intervals with clusters of trees, snow-white cottages, and neatly adorned churches, present themselves amidst the rich and verdant foliage that covers its steep banks. The view is bounded by lofty mountains, and lengthened out to the verge of the visible horizon by interminable forests.^h The produce of the land consists of tobacco, which is chiefly cultivated for the consumption of the colonists, and of different kinds of pulse and grain, which form an article of exportation. The culture of wheat has made very considerable progress of late years; the soil improves gradually as we ascend the St. Lawrence. This progressive improvement continues through Upper Canada, which as much surpasses the lower province in fertility, as Montreal is superior to Kamarouska. On the north and south banks, in the neighbourhood of Quebec, the soil on the heights covers but thinly an immense bed of black lime slate,ⁱ which, as it becomes exposed to the air, shivers into thin pieces, or moulders into dust. The meadows of Canada are reckoned better than those in the more southern parts of America. But the Canadians are wretched husbandmen; they seldom manure their lands, and never plough them sufficiently deep. Hence the ground is soon exhausted, and the fields are covered with noxious weeds. The straw of their wheat is seldom more than eighteen or twenty inches long; and the ear is about a third part less than that produced in England. This plant is sown early in May, and it is commonly ripe about the end of August. The French Canadians give themselves rarely any trouble about gardens or orchards, while their neighbours in the United States have a large plantation of apple, pear, and peach trees, adjoining to their houses. Strawberries and raspberries are the best fruits in Canada; they appear in rich luxuriance on the plains behind Quebec, and are carried thither in great abundance during the proper season. Apple and pear trees are more abundant, and arrive at greater perfection in the vicinity of Montreal than in any other part of Lower Canada. The wild grapes, and those produced from vineyards, are little larger than currants; when ripe, they have rather an acid and pungent, but not a disagreeable flavour. Melons grow in great profusion; it appears indeed, that this plant is indigenous to Canada. Two kinds of wild cherry trees are plentifully scattered through many of the woods, but their fruit has hitherto been considered of little value. The English walnut tree is not adapted to bear the sudden successions of cold and heat, which mark the Canadian spring.^k A great many of the plants of Lapland and the United States, have been observed among the native productions of the country situated on the north of the St. Lawrence.^l The great heat of the

^l "There is a singular mixture of the *floras* of Lapland and the U. States, in the country N. of the St. Lawrence."

summer is probably the reason why the annual plants, and such as are protected by the snow during winter, are in general the same with those of more southern latitudes, while the trees and shrubs, on the other hand, having no shelter against the inclemency of the seasons, belong to the species that are found in the arctic regions. The ginseng, and the lily of Canada, which is similar to that of Kamtchatka, appear to indicate some resemblance between the botanical productions of Asia and America. The *Zizania aquatica*, a gramineous plant peculiar to this country, and not unlike rice, grows in the marshy grounds;^a it affords food to the water-fowl, and occasionally to some tribes of wandering Indians.

Although Canada abounds with forests, the trees do not acquire there the same loftiness, and the apparent luxuriance of life, that distinguish them in the United States. The different kinds of ever-greens and of firs are the most numerous and varied. Among others, there are the silver fir, the Weymouth and Canadian pines, the American fir, and the white cedar of Canada, or *Thuja occidentalis*, which must not be confounded with that of the United States, or the *Cupressus disticha*. After these trees, which are considered the most valuable, we may mention the sugar maple and the red maple, the birch, the American lime, the American elm, the iron-wood and the Judas tree. The numerous kinds of oaks have not as yet been well defined; those of Europe, however, present themselves only in the form of stunted shrubs. The naval timber of Canada is chiefly imported from New England. An English ship of war, built lately with Canadian oak, became unfit for service after a few years. A tree called the live oak, which is found only in the warmer parts of the country,^b is said to be well adapted for ship-building. The sassafras, the laurel, and the red mulberry tree, grow in the islands of the River St. Lawrence, but seldom arrive at any degree of perfection. The ash, the yew, and the mountain ash, are common to the northern countries of the old and the new world; but the forests in Canada are adorned with the light festoons of the wild vine, and the odoriferous flowers of the Syrian asclepias.^c There is indeed scarcely a tree in these great woods, that has been considered useless;^d and the making of pot and pearl ashes has contributed to enrich the American settlers. The sugar maple tree, or *Acer saccharinum*, supplies the inhabitants with good fire wood, and with a great quantity of sugar. The maple-sugar is made early in spring, when the sap rises in the trees. As the snow is not completely melted at that season, the Canadians suffer great hardships in drawing off the juice from an immense number of trees, dispersed over many thousand acres. The liquor is boiled, and sometimes mixed with flour, which renders it thick and heavy.

^a "In the mud of the rivers." It grows in the shallow waters along the shores of rivers and lakes. The Indians, in the season of their rice harvest, push their canoes among it, and beat off the seeds into them.—P.

VOL. II.—NOS. 75 & 76.

It is then poured into jars, and when cold, forms itself into a cake, of the shape of the vessel. This sugar is very hard, and of a dark-brown colour; when used for tea it must be nearly reduced to powder, as it could not otherwise be easily dissolved. By being clarified, it assumes a white colour. The maple sugar is sold for about half the price of that from the West Indies.^e

The animals that inhabit the vast forests, or wander in the uncultivated regions of Canada, are the American elk, the fallow-deer,^f the bear, the fox, the marten, the wild-cat, the ferret,^g the weasel, the hare, the rabbit, and the gray and red squirrel. The southern districts are stored with buffaloes,^h small fallow-deer, roebucks, goats, and wolves.ⁱ Otters and beavers, that are highly prized on account of their skins, are found in great numbers in the lakes and marshes. Few rivers can be compared with the St. Lawrence for the variety, abundance and excellence of its fish. But the rattle-snake, and the American crocodile,^k the noxious reptiles of the southern regions, are sometimes seen along its banks. The earliest travellers observed the turkey^l in this country.^m It has been erroneously supposed to be a native of the coast of Malabar; and it is owing probably to the prevalence of this error, that these animals have been called in Germany the fowls of Calicut.ⁿ We may enumerate, among other birds, the wild pigeon, the partridge, grouse, ptarmigan, and quail. The humming bird in Canada is the smallest that is known;^p it is often seen during summer among the flowers of the gardens near Quebec. It gathers food from the blossoms, and is continually on the wing. The body of this little animal, when divested of its plumage, is not larger than a bee.

Different mines of iron ore have been discovered in Canada, but there are few foundries as yet established. Copper and lead have not been found in any considerable quantities. It has been supposed that there are mines of lead, mixed with a very small portion of silver, near St. Paul's Bay, about fifty-four miles below Quebec.

Canada was formerly called New France: fiefs,^q which extended along the banks of the St. Lawrence, were granted by the crown of France to the first settlers. The rest of the country was inhabited by the natives. Gaspe, or Gaschape,^r is situated on the south of this great river, at its mouth; although it is under the government of Canada, we shall describe it more conveniently along with New Brunswick. The line betwixt Upper and Lower Canada commences at a stone boundary on the north bank of Lake St. Francis; it proceeds from thence to the Ottawa River, and to its source in Lake Temiscaming; and continues still north until it meets the boundary of Hudson's Bay. Upper Canada has been lately divided into ten districts, and

ⁱ The bison, or buffalo, is no longer found in Canada, unless in the extreme western districts, beyond Lake Superior. The fallow deer, roebuck and goat of Europe are not natives of N. America. A species of wild goat is found in the Rocky Mountains.—P.

^r "Gaspésie."

nearly 300 townships;^{a b} but these divisions vary with the increase of population.

A commodious harbour, that can afford a safe anchorage for several fleets; a large and beautiful river, whose banks are sheltered by steep cliffs, or interspersed with forests; a lofty rock covered with houses, rising gradually above each other in the form of an amphitheatre; the two promontories of Point Levi and Cape Diamond, the majestic chasm of Montmorenci and its snow-white cataract, embellish and adorn the capital of Lower Canada. The upper part of the city is built on the heights of Cape Diamond, and raised about three hundred and forty-five feet above the lower town,^c which extends along the banks of the river at the base of the hill. In the winter time the fissures of the rock are filled with snow, which, while it freezes, expands beyond its usual limits, and bursts its cavities;^d these are loosened by the warmth of spring, and often precipitated on the unwary passenger. A traveller, before his arrival at Quebec, is apt to form too high an opinion of its public edifices, from observing the splendour that is produced by the tin or sheets of iron which cover them. The finest building in this city is the ancient seminary of the Jesuits, situated in the market place of the upper town. It has been lately converted into excellent barracks, which can accommodate with ease more than 2000 soldiers. The revenue of these priests was formerly very considerable, being upwards of 12,000*l.* at the time it reverted to the British crown. The other buildings most worthy of notice are the old castle of St. Louis, the court-house, and the English cathedral. The advantages of situation, and the improvements that have been made in its fortifications, may enable Quebec to resist the dangers of a protracted siege. It has been said that 10,000 men may defend the city. In the event of an attack, however, the garrison may be increased in a few hours, by the troops that are generally stationed at Three Rivers and at Montreal. A fleet too can easily supply the town with provisions, so long as the inclemency of winter does not interrupt the navigation of the St. Lawrence. The population of Quebec amounts to 22,000 souls. During the winter its inhabitants amuse themselves by taking excursions in their carioles; and the dullness of a long night is enlivened with the pleasures of the dance. The garrison supports a bad company of actors: and the horse races, which have been lately introduced, tend to improve the breed of that useful animal.^e

Montreal, the second town of Lower Canada, is built upon an island of the same name, about thirty-two miles in length, which is encompassed by the united streams of the Ottawa and the St. Lawrence, immediately below their junction. This majestic river is here nearly two miles in width, and although 500 miles distant from the ocean, is capable of supporting on its surface vessels of 6 or 700 tons burden. This town has a fine appearance. The mountain, from which its name is derived, rises on the left of the city; it is not a conical eminence, but a swelling semicircular ridge, with its concave side towards the river. The hill seems placed like a rampart behind Mon-

treau to shield it from the rude blast of winter. A thick forest covers the greatest part of it; some space has been left for a few neatly built houses, whose bright roofs glitter in the sun-beams. This city contains about 15,000 souls;^f its commerce consists chiefly of furs. The principal merchants of the North-west Company reside at Montreal; it is their emporium, and the great mart of the trade that is carried on between Canada and the United States. The enterprising spirit of its directors has tended to diminish the profits of the Hudson's Bay Company. They employ 3000 individuals as factors, travellers, and huntsmen. The clerks are mostly adventurous Scotsmen, who are forced by penury to emigrate from the Hebrides, to certain hardships, and dubious affluence, in the dreary wilds of the North-West. The small town of Three Rivers is situated between Quebec and Montreal. Although its inhabitants are not more than 1500, it passes for the third city of the province. Sorrell was built by the American loyalists in 1787. It contains about a hundred detached houses, and supplies the inhabitants of the town and neighbourhood with English manufactured goods and West India produce. The importance that was formerly attached to Sorrell arose from its ship building, which has of late years entirely ceased.

The towns of Upper Canada are still in their infancy. The traveller, after leaving the St. Lawrence to enter Lake Ontario, crosses the gulf that has been improperly denominated the Lake of the Thousand Islands. Kingston is situated on one of its creeks. It occupies the site of the old fort Frontenac, the ruins of which are still extant, as well as the remains of a breast-work thrown up by the English. The harbour is on the east side of Kingston, and is formed by a bay that stretches towards the front of the town. The west shore of this bay is bold, and well adapted for wharfs, because vessels of any burthen may not only lie in safety, but load and unload with convenience and ease. From its situation, this city is the depot of those articles of commerce which are transported across Lake Ontario in vessels, and along the river in boats. They meet, deposit, and exchange their cargoes at Kingston. York, which is the seat of the provincial government, is finely situated on a bay, extending nearly two miles from the west to the east side of the town, and almost enclosed by a peninsula, which stretches to a corresponding distance from east to west without the basin of the harbour. Burlington Bay is a small lake, separated from that of Ontario by a sandy beach, which extends five miles in a northerly direction, from Saltfleet to Nelson, with a narrow outlet running from the bay across the beach, and having a bridge over it; on the west of the bay, divided from it by a promontory extending from north to south, is a marsh, or marshy lake, named Coot's Paradise, which is famous for its game. The beach, the bay, the promontory, and the marsh, form perhaps as wild scenery as any in America. The town of Niagara was originally called Newark, but the name was changed by law in 1798. It is still generally, but erroneously, described by its first appellation. It is situated on the left bank of the Niagara, and extends along

^a Supplement to Encyclopædia Britannica, article Canada. Gourlay's Canada.

^f Population, in 1822, 18,767, of whom 6,877 were English.—Morse.

the shore of the lake to a considerable distance towards the west. Fort George is more than a mile higher up the river. In pursuance of the treaty of 1794, the garrison was removed from the old fort on the opposite bank, and stationed at Fort George; its works have been since strengthened and improved. Fort Erie stands on ground elevated about fifteen feet above water, at the outlet of Lake Erie; it has a good harbour and a pleasant little village.^a London is still an inconsiderable town; the natural advantages on which the expectation of its founder depended, were its central position between the Lakes Ontario, Erie, and Huron; its fortunate situation on the Thames; the fertility of the adjacent country; the mildness and salubrity of the climate; the abundance and purity of its water; its means of military and naval protection; and the facility of its communication with Lake St. Clair, through the outlet of the Thames; with Lake Huron, by the northern branch of that river; and with Lake Ontario, by the military road. Hence the names of the river, the contemplated metropolis, and the adjacent towns, were taken from corresponding ones in the mother country. Fort Malden commands the River Detroit, and is situated on its eastern bank, three miles above its entrance into Lake Erie; the town contains 108 houses and 675 persons.^b

We may remark that the southern extremity of Canada forms a peninsula that is separated from the rest of the province by the Rivers Severn and Trent, which are connected together by a chain of small lakes. The rest of this peninsula is bounded by the Lakes Huron, Erie, Ontario, and by the Rivers St. Clair, Detroit, and Niagara. The soil is a vegetable mould that rests on beds of limestone. Many of the rivers are turbid in this part of America, but there is no great body of stagnant water. The country is fertile in wheat and clover; it abounds also with excellent peaches and other kinds of fruit. The temperature of the banks of Lake Erie is almost as mild as that of Philadelphia.^c This fruitful and happy region, so different from the other parts of Canada, was claimed by the United States previous to the treaty of 1783; that republic is still ambitious of obtaining it; but the English are fully aware of its military and political importance.

Canada was originally neglected by the court of France, yet its population increased more rapidly than might have been supposed, considering its disadvantages. When it was conquered by the English in 1759, the number of its inhabitants amounted to 70,000.^d The revolution which took place in the government and political institutions of the country in consequence of that event, retarded for a few years the progress of population. But the change of allegiance was rendered as easy as possible by the lenient measures of the conquerors. The laws were allowed to remain unaltered, the inhabitants were secured in the undisturbed possession of their lands under the ancient tenures, and in the free exercise of their religious rites. The prosperity of the country, and the great increase of its population, may be judged of from the following authentic table:—

Date of the census.	Number of inhabitants.	Acres of land in cultivation.	Bushels of grain sown annually.	Horses.	Cattle, swine, &c.	Sheep.	Swine.
1765	76,275	764,604	194,724½	13,757	50,329	27,064	28,076
1783	113,012	1,596,817	383,349½	30,096	98,591	84,000	70,406
Increase in 18 years.	36,737	832,214	188,625	16,339	48,262	57,000	41,400

In 1814, according to a regular census, the province of Lower Canada alone contained 335,000 inhabitants.¹ Of this number 235,000 may be considered as descendants of the original French settlers. The remainder is composed of emigrants from various nations, chiefly English, Scotch, Irish, and American. In 1783, the settlers of Upper Canada were estimated at 10,000, but the most of them were included in the numerous frontier posts and garrisons. After this period, the number of settlers, in consequence of a great accession of loyalists, disbanded soldiers, and emigrants from the United States and Great Britain, increased so rapidly, that in the year 1814, the inhabitants of the province amounted, according to the most accurate returns, to 95,000.² Mr. Gourlay estimates the population of Upper Canada in 1820 at 134,259 inhabitants,^h among whom he calculates 3259 Indians.ⁱ

The greater part of the French population is confined to the northern bank of the St. Lawrence, from Montreal to Quebec. That extensive line of farms and cultivated fields may have improved the aspect of the country, but it has not much contributed to the welfare of the first settlers. The Canadian farmers of that district appear to act in a manner diametrically opposite to that of the Anglo-Americans. They quit with reluctance the place of their birth; the members of a family choose rather to divide the last acre of their estate, than to emigrate and cultivate neighbouring lands, the fertility of which is superior to their own.

The first French colonists are said to have come from Normandy. Their wants are easily supplied; they have shown themselves attached to their religion, and submissive to the government that has respected their independence. Their natural sagacity and courage may make us regret that they have been so long deprived of every means of useful instruction. For the chance of a moderate profit, the French Canadians endure frequently painful hardships, and undertake the most fatiguing journeys; they cultivate flax, and their sheep furnish them with the wool of which their garments are made; they tan the hides of their cattle, and use them for mocasins or boots. They knit their own stockings and caps, and plait the straw-hats that are worn by them in the summer season. They make, besides, their bread, butter, cheese, soap, candles, and sugar; all of which are supplied from the produce of their lands. The farmers construct their carts, wheels, ploughs, and canoes.

The countenance of a French Canadian is long and thin, his complexion sun-burnt and swarthy, and nearly as dark as that of an Indian. His eyes are lively, his cheeks lank and meagre, and his chin sharp and prominent. The man-

ners of these inhabitants are easy and polite; they treat their superiors with deference, their inferiors with affability. Their carriage and deportment are graceful and unrestrained, and they appear more like men that have lived in a great town than those who have passed their days in the country. They live on the most affectionate terms with each other; parents and children to the third generation reside frequently in the same house. Although the practice of dividing their lands may be prejudicial to their interests, still their desire of living together is a proof of the harmony that subsists among them. They marry young, and are seldom without a numerous offspring; their passions are by this means confined within proper limits, and the descendants of the first settlers are rarely guilty of those excesses which disgrace too often the inhabitants of large cities.

The winter dress of the *Habitans* may give them the appearance of Russians, but French gaiety still maintains its sway in this cold country. Their social intercourse is of the same simple and homely kind as that of the French before the age of Lewis the XIV. As soon as the long fast in Lent is ended, the days of feasting begin. Whatever their lands supply is then presented for the gratification of their friends and relatives; immense turkey pies, huge joints of pork, beef, and mutton, large tureens of soup, or thick milk, fish, fowl, and a plentiful supply of fruit, decorate the board. The violin is heard immediately after dinner, and minuets and country-dances increase the hilarity of the guests. The women, and even the men, are sometimes vain enough to powder their hair and paint their cheeks; "in this respect," says a shrewd traveller, "they differ only from their betters by using beet-root instead of rouge."^a

The Canadian settlers enjoy many advantages. A peace, that has lasted for more than fifty years, has augmented the wealth and comforts of the higher orders of society; yet the *Habitans* are very ignorant. Public instruction has been so much neglected, that several members of the provincial assembly can neither read nor write. The Quebec Mercury proposed lately, with much gravity, the establishment of a seminary for the instruction of the members of Parliament that were deficient in these two branches of elementary education. A recent traveller, who has perhaps exaggerated the indolent habits of the French Canadians, confesses that they are not much inferior in industry to the Virginians. The English colonists of Upper Canada do not as yet differ very much in their character from the inhabitants of the mother country.

The manners and customs of the two provinces are not more dissimilar than their government and laws. The English law, both civil and criminal, was first introduced into Canada after its conquest in 1759. The penal code of Great Britain was esteemed by the people a very great improvement, in as much as it freed them from the arbitrary enactments of their former rulers. In 1792, by the 31st George III. all the advantages of the English constitution were extended to Canada. Two houses of parliament, a legislative council, and a house of assembly, were appointed in each province. These two houses have the privilege

of proposing laws, which, after receiving the sanction of government, are transmitted to the king of England, who has the right of repealing them any time within two years. The legislative council of Upper Canada consists of not fewer than seven members, and that of the Lower Province of at least fifteen, all of whom are nominated by the British parliament. The house of assembly is composed of sixteen members in Upper,^b and of fifty-two in Lower Canada, who are elected by the freeholders of the towns and districts. In the counties, the land-proprietors that have an estate of the annual value of forty shillings are qualified to vote. In the different towns, the voters must be either possessed of a dwelling-house and a piece of ground, worth at least 5*l.* Sterling a-year, or they must have been settled a twelve-month in the country, and have paid not less than 10*l.* of yearly rent. The assemblies are quadrennial, but the governor can dissolve them within that time. The municipal law of Lower Canada is regulated by the custom of Paris anterior to the year 1666.^c The English laws and forms of procedure have been adopted in Upper Canada. The executive authority consists of a governor, who is generally commander of the forces, of a lieutenant-governor, and of an assembly, composed of seventeen members, which exercises an influence in the country, similar to that of the privy council in England.^d The governor is invested with the prerogative of giving the royal assent or refusal to all the acts that have been approved of by the two houses of legislature.

The only real advantage which Great Britain has obtained from the possession of Canada, is derived from its commerce with that colony. The expenses of the civil list in Lower Canada amount to 45,000*l.*; nearly three-fourths of this sum are defrayed by the province, out of the king's domains, and by duties payable on certain imports. The remainder is supplied by the English government, which supports the Protestant clergy, and the military and Indian establishments. The costs of the civil administration of Upper Canada are reimbursed by direct taxes, by duties on articles imported from the United States, and by a sum which is taken from the revenue of the lower province. In addition to these expenses, the British government lays out annually about 500,000*l.* for the maintenance of the clergy, for the distribution of presents to the Indians, and for the forces and garrisons that are required to defend the country. Although this province is so costly to the English, its possession has been considered as useful and important to the mother country in time of peace. Canada is the great market for several articles of British manufacture that are imported into the United States. The agricultural produce of the country, and the articles which English commerce procures by this channel from the interior of North America, have given rise to an increasing exchange, and to an extensive navigation. In 1808, the exports were valued at 1,156,060*l.* and the imports are said to have exceeded 610,000*l.* Three hundred and thirty-four vessels, capable of containing 70,275 tons, sailed from Quebec in that year.^e The number of sailors who were engaged in the service amounted to 3300 men. In 1810, 661 vessels were employed, the burden of which was calculated at 143,893

^d The British provinces in N. America are presided over by a go-

vernor general, who resides at Quebec; but each of the provinces has its lieutenant governor and executive council, that of Upper Canada consisting of 5 members (1818,) exclusive of the chief justice and lord bishop, who are members *ex-officio*.—P.

^e "The number of vessels was 334," &c. This statement includes the entire commerce of Canada.—P.

tons; these ships were manned with 6000 seamen. The imports that were then brought into Quebec were valued at 972,837*l.*; if we add to them those conveyed by Gaspé, and Lake Champlain, the whole sum will amount to at least 1,050,000*l.* The exports from the port of Quebec in the same year, were computed at 1,294,000*l.* which, with the exports from Labrador, and Gaspé, and by Lake Champlain, may be estimated at 1,500,000*l.*

Canada, considered as a military position, forms the principal link in that chain of British possessions in North America, which extends from Acadia and Newfoundland, to the vicinity of Lake Winnipeg. As long as the English nation retains the advantages which these colonies afford it, England will always be the most formidable enemy, or the most useful ally, of the great American republic, the only rival that has been able to contend with the modern queen of the ocean.

We do not propose to give a minute account of the savage tribes that dwell within the limits of Canada. The country of the Hurons is situated on the north and the east of the lake which bears their name; they have also a considerable town on the banks of the Detroit. Some scattered villages on the River Ouse, are peopled by the remains of the tribes that were called the Six Nations, principally by the Mohawks. The Mississagas, the faithful friends of the Algonquins, still inhabit that part of the peninsula of Canada near the sources of the River Credit. The Iroquois are for the most part settled on the banks of the Ottawa; they are now, however, but the feeble remnant of that once formidable and generous tribe.

Mr. Lambert saw, at the house of one of his friends, Captain John, an old Iroquois chief, who assisted the English in the American war. The veteran related an anecdote respecting the narrow escape which himself and a British officer had made. The latter happened to be dressed in green, like some of the Americans, and as they were skirmishing in the woods, the two parties came suddenly on each other. John and the officer presented their rifles and were about to fire, when the Englishman called upon him by name; he spoke very opportunely, for another moment might have been too late. The old warrior declared, as the big tear trickled down his sun-burnt cheek, that both of them were likely to have perished, for they were excellent shots. This chief had a daughter, who was celebrated for her beauty; being attached to an English gentleman, her love became too powerful for her virtue. After having a child to her lover, he refused to comply with the ceremony of marriage; on this account she armed herself with a brace of pistols, and went in pursuit of her Theseus. It is affirmed, that her desire to avenge her honour was so great, that the false Englishman never ventured afterwards to appear in the country.

The Indian village of Cachenonaga^a is not far from Montreal; it contains 1200 inhabitants, who are descended from the Agniers, a tribe of the Iroquois. Although bitter enemies to the French, they were partly civilized and converted to the Christian faith by the indefatigable zeal of the Jesuits. The women are particularly solemn and devout in their deportment, and are strongly attached to the Holy Virgin. From a sense of religion and humanity,

they educate the illegitimate children that are forsaken by their European parents. The Chevalier Lorimier was employed by government as interpreter. He married successively two Indian women, and adopted so much the manners and customs of the country, that he appeared latterly more like an Iroquois than a Frenchman.

The Tummiskamings^b speak the Algonquin, or Knisteneau dialect, and dwell to the north of the sources of the Ottawa. The country of the Algonquins extends along the River St. Maurice. There are still some hamlets in the vicinity of Quebec, that are inhabited by christianized Hurons, who speak the French language. The Piquagamis in the environs of Lake St. John, the Mistissings on the lake of the same name, and the Papinachis to the north of the River Saguenay, live at peace with their neighbours, and begin to cultivate the ground. These tribes appear to be of the same origin as the Algonquins.

In going down the River St. Lawrence, we observe on our right a country that resembles very much the most mountainous districts of Canada. It abounds with wood, and is watered by many rivers, but its climate is variable and unwholesome, on account of the thick fogs which are exhaled from the sea. The name of this district is Gaspé, the native country of an Indian tribe that was remarkable for its civilization, and its worship of the sun. The Gaspesians were acquainted with the different points of the compass; they observed the positions of some of the stars, and traced geographical maps of their country with sufficient accuracy. A part of this people worshipped the cross, before the missionaries arrived amongst them; they retained a curious tradition, concerning a venerable person who cured them of an epidemic, by making them acquainted with that holy figure.^c The bishop of Greenland, who attempted to christianize the natives of Vinland^d in 1121, may perhaps pretend to the honour of being the apostle of the Gaspesians. The name of Gaspé is now only given to the country that lies between the River St. Lawrence and Chaleurs Bay.

New Brunswick extends, in one direction, to the Gulf of St. Lawrence, and, in the other, to the Bay of Fundy. It is bounded by the United States on the west; and terminates on the south at the isthmus which leads to Nova Scotia. The prosperity, the population, and agriculture of this country, have increased of late years. The River St. John is navigable by vessels of fifty tons burden for about fifty miles; and merchandise can be easily transported in boats more than three times that distance. The effects of the tide are perceptible for a very considerable way up the river.^e It abounds with salmon, sea-wolves, and sturgeons. Its banks are level, rich, and fertilized by annual inundations; they are covered in several places with lofty trees. An easy communication is afforded to the inhabitants of New Brunswick with Quebec, by means of this river. The exports, which consist of timber, fish, and furs, occupied in 1810 not less than 410 vessels, of 87,690 tons. The caribou, the moose-deer, the lynx, the bear, and other Canadian animals, have been observed here, although many of them are unknown in Nova Scotia. There are at present more than 150,000 colonists^f in the territory of New Brunswick; and the indigenous tribe of the Marechites is redu-

ced to little more than 100 men.^a Fredericktown, which is situated on the River St. John, is the capital of the province. The town of St. Ann's is nearly opposite to it. There are some other towns of less consequence, near the Bay of Fundy.^b

The English have kept possession of Acadia from the year 1713. They divided it into two provinces in 1784, after the peace that confirmed the independence of the United States. The first of these districts is formed by the eastern peninsula, and retains the name of Nova Scotia, which was given to the whole country before its division; the western part of the province was reserved for the German troops in the service of Great Britain, who wished to establish themselves in America, and it received on that account the appellation of New Brunswick.

The climate of Nova Scotia, in common with the adjoining portion of America, is very cold in winter, but its harbours are never frozen. The fogs which rise from the sea, render the atmosphere gloomy and unwholesome. There are generally some days of delightful weather in spring; and the warmth of summer, which brings forward the harvest in a short time, is equal to that of the southern countries of Europe. This country, although generally rugged and mountainous, contains several pleasant and fertile hills, particularly in the vicinity of the Bay of Fundy, and near the banks of the rivers, which are there discharged into the sea. Vast marshes, that extend twenty and twenty-five leagues into the interior of the country, have been there drained and cultivated. The plains and the hills present an agreeable variety of fields, sown with wheat, rye, maize, peas, beans, hemp, and flax. Different kinds of fruit, of which the best are the gooseberry and raspberry, flourish in the woods that overtop the heights, and cover the greater part of the province. The forests are interspersed with oaks, that are well adapted for ship-building; but they abound chiefly in fir, pine, and birch, which furnish pitch, tar, and turpentine, together with wood for the sugar-works in the West Indies. There is a great variety of game and wild fowl in Nova Scotia. The rivers are stored with salmon; and the fishing companies send cod, herring, and mackerel, to Europe. The numerous bays, harbours, and creeks, facilitate greatly every sort of commerce; and many of the rivers are navigable, and advantageously situated, for the carriage of goods.

Frequent emigrations, and the banishment of the ancient French settlers, who, although they called themselves neutral, were suspected of having assisted the natives^c in the war which they waged against their new masters, tended to decrease the population of this country after its occupation by the English. The British government did not pay much attention to the interests of the colony, until after the treaty of Aix-la-Chapelle. More than 4000 disbanded soldiers and sailors were induced to remove to it with their families, by liberal concessions of land, and by the promise of the assistance of the mother country. They were carried thither at the expense of government; fifty acres were assigned to each individual, and their property was exempted from all taxes for the space of ten years:

^a "140 warriors."—M. B.

^b The city of St. John is situated on the River St. John, 3 miles above its entrance into the Bay of Fundy. It is the largest and most commercial town in the province. Population, in 1822, estimated at 8000. St. Andrews, on Passamaquoddy Bay, at the mouth of the St. Croix, is a place of considerable transit commerce with the U. States—P.

^c There seems to be some doubt about the name of the aborigines of Nova-Scotia;—they have been called by different writers, Micmacs

but every man was obliged to pay, after this period, an annual impost of a shilling on his estate. Ten acres were besides given to every member of their families, and they were promised a farther augmentation, in the event of their having more children, or by showing themselves worthy of it, by the proper cultivation of their ground. These colonists did not fulfil the expectations that were formed of them. The excellent harbour of Halifax is now of the utmost importance. Its great utility has proved that the sum of 4000*l.* which was annually expended upon it, for a period of twenty years, has not been unprofitably laid out. The advantages of its position were rendered apparent in the different American wars, when this port, which commands in some respect the Atlantic Ocean, served as a station for the fleets of Great Britain, and as a place of refuge for her merchantmen. The town is well fortified, and contains from 15,000 to 20,000 inhabitants.^d It is the residence of the governor of the province, and of a court of admiralty, whose jurisdiction extends over the whole of the English possessions in North America. The islands of St. John and of Cape Breton, are subject to Nova Scotia. Annapolis, another convenient harbour, formerly called Port Royal, is situated on the Bay of Fundy, nearly opposite to Halifax; but the town itself is as yet little larger than a village. The city of Shelburne is built on Port-Roseway Bay, on the S. E. coast of the peninsula; it contained only fifty inhabitants at the beginning of the first American war, but its population at present may amount to 9000 or 10,000 souls.^e

Cape Breton, or Isle Royal, is separated from Nova Scotia by the Straits of Canso or Fronsac. It was said by the French to be the key of Canada, yet its harbours are frequently blocked with ice. The climate is subject to violent tempests, and the atmosphere is darkened by dense fogs; it frequently happens when these mists are congealed in the winter season, that they leave on the ground a thick covering of hoar-frost.^f The quantity of ice taken from the rigging of one of the ships employed in blockading the island in 1758, was said to be not less than seven tons;^g what is more remarkable, it is affirmed that this prodigious mass froze in the month of May.^h Although the greater part of the soil is unfruitful, there are some oaks of a very great size, and many pines that are used in making the masts of ships; a small quantity of corn, flax, and hemp, is cultivated on the island. The mountains and forests are stored with wild fowl, and particularly with a sort of large partridge, which resembles the pheasant in the beauty of its plumage. This country is at present almost completely abandoned, although there is a considerable quantity of coal at no great depth under its surface.

Louisbourg is built on the south-east coast of the island. Its harbour is one of the finest in America. The French began to fortify this place in 1720; it was taken from them by the English in 1745, and restored by the peace of Aix-la-Chapelle in 1748. It was again reduced by Boscawen and Amherst in 1758, and added finally to Great Britain by the treaty of 1763; since that period its fortifications have been demolished.

(M. B.) Mikemacks (Lahontan, v. II. p. 27.) and Mikmoses, (Description of their manners, London, 1758.)

^d Population, during the late war, estimated at 12,000; in 1823, at 9000.—Description of Nova-Scotia. Halifax, 1823.

^e Population, in 1783, said to have exceeded 10,000: in 1816, only 374. It has since decreased.—*Desc. Nov. Scot.*

^h May 5th.—M. B.

The Island of St. John, now called Prince Edward's Island, is in the vicinity of Cape Breton, and surpasses it greatly in fertility and in the beauty of its scenery. The French called this island the store-house of Canada, because it supplied that country with grain, as well as beef and pork. The numerous rivers that water its fields afford the inhabitants plenty of salmon, eels, and trouts, and the adjacent sea abounds with sturgeons and a great variety of shell-fish. It possesses a convenient haven for its fishing vessels, and every kind of wood that is required for building ships. In 1789, the population, which is still increasing, amounted to 5000 persons.

The Island of Anticosti is ninety miles long and twenty broad; it is covered with rocks, and has no convenient harbour.^a

The large island that is called by the English Newfoundland, and by the French *Terre-Neuve*, shuts up, on the north, the entrance into the Gulf of St. Lawrence. The perpetual fogs which cover it, are probably produced by the current that flows from the Antilles,^b and remains for a time between the great bank and the coast, before it escapes into the Atlantic Ocean. As this current retains a great portion of the heat which was imbibed in the tropical regions, it is from fifteen to twenty degrees of Fahrenheit warmer than the surrounding water on the banks of Newfoundland. Whenever, therefore, the temperature of the atmosphere is colder than that of the current, a vapour must necessarily arise from the latter, which obscures those places with a moist and dense air. The island, with the exception of the banks of the rivers, is barren and unfruitful. It contains, however, different kinds of trees, that are principally used in the numerous scaffolds which are erected along the shore for the purpose of curing fish. The glades of Newfoundland afford occasionally good pasturage for cattle. In the interior there is a chain of lofty hills intersected with marshes, which give a wild and picturesque aspect to the country. The forests afford shelter for a great many wolves, deer, foxes, and bears. The rivers and the lakes abound with beavers, otters, salmon, and other amphibious animals and fishes. But all these advantages are of little consequence when compared with the great profit that has been obtained from the fishing of the neighbouring seas. On the east and on the south of the island there are several banks of sand that rise from the bottom of the ocean, the greatest of which extends nearly ten degrees from south to north.^c The stillness, and comparatively mild temperature of the water in their vicinity, attract so many shoals of cod, that the fisheries which are established there, supply that article to the greater part of Europe. These animals quit the banks about the end of July, and during the month of August. The fishing season begins in April and ends in October. The length of the cod seldom exceeds three feet, and the conformation of its organs is such to render it nearly indifferent to the choice of its food. The voracity of its appetite prompts it to swallow indiscriminately every substance which it is capable of gorging; glass, and even iron, have been found in its stomach; by inverting itself, it has the power of discharging these indigestible contents. The fishermen range themselves along the side of the vessel,

each person being provided with lines and hooks. As soon as a fish is caught, they take out its tongue, and deliver it over to a person, in whose hands after having undergone a certain degree of preparation, he drops it through a hatchway between decks, where part of the back bone is cut off, and the cod, in order to be salted, is thrown through a second hatchway into the hold. Whenever a quantity of fish sufficient to fill one of the vessels has been taken and salted, she sails from the banks to the island and unloads her cargo. The ship returns again to her station, and in the course of the season completes four or five different freights. The fish are dried on the island, and larger vessels arrive from England to convey them to the European markets. Much care and attention are required in packing this article; the greatest precaution is used to preserve it from the moisture of the atmosphere. A person denominated a culler, or inspector, attends the loading of each vessel, in order to see that all the fish are completely cured before they are put into the cargo, which might otherwise be soon damaged. The price of dried cod at Newfoundland is commonly fifteen shillings the quintal, and it is sold in Europe for about a pound Sterling. In a vessel, with twelve men, there must be 10,000 fish caught, salted, and brought into market, from the middle of April to July, else the owners will be excluded from all claim to the established bounty. Such a crew, however, takes usually during that season more than double that quantity. The English merchants who are engaged in these fisheries supply the sailors upon credit with whatever they stand in need of, and are repaid at the end of the year with the produce of their industry. Several hundred thousand pounds are thus annually advanced on an object of commerce before it is taken from the bosom of the deep. About 400 ships, amounting to 36,000 tons burthen, and 2000 fishing shallops, of 20,000 tons, are usually employed during the fishing season. Twenty thousand men from Great Britain and Ireland are engaged in this trade, and several thousands of them who remain on the island during the winter, are occupied in repairing or building boats and small vessels, or in erecting scaffolds for drying the cod. The persons that are not seafaring men have been distinguished by the appellation of planters.^d

Among the animals of Newfoundland, there is a particular kind of dog, remarkable for its size, its fine glossy hair, and especially for its excellence in swimming. Some writers have supposed that this breed was originally produced from an English bull dog and a native she wolf.^e It is ascertained, at all events, that these animals did not exist at the time of the first settlers.

This island, which was so long considered the inhospitable residence of fishermen, has within a few years doubled its population and industry. The towns of Placentia and St. John's, since their embellishment and extension, have assumed a European aspect. The population of Newfoundland was estimated in 1789 at 25,000 inhabitants; it contains at present about 75,000 souls. The predictions of Whitbourne and Sir Humphrey Gilbert have been verified, and the activity of the British nation has added another fine colony to the civilized world.^f

We cannot give more properly an account of the Ber-

mudas Islands than in this place. That group, situated half-way between Nova Scotia and the Antilles, is politically connected with the former, since it serves as a summer station for the ships that winter at Halifax. The Archipelago is about thirty-five miles in length, and twenty-two broad, but there is a long and dangerous ridge of rocks near it. The size of the islands varies considerably; the least is not more than two or three hundred paces, the largest is about twelve miles. From a distance they have the appearance of hills covered with a dark verdure, at the bases of which, the ocean is dashed into white foam. The water in these islands is brackish, with the exception of that which falls from the clouds; it is kept in large cisterns, in order to supply the inhabitants, and not unfrequently some ships of war. The air is considered pure and wholesome. The cedar trees that grow in these islands constitute almost the sole riches of the settlers, who form them into small vessels which are used in coasting between the United States, Acadia, and the Antilles. The fortune of an individual is computed by the number of his trees, each of which is worth about a guinea standing. Agriculture is neglected, on account of the cedar plantations occupying the greater part of the rich lands. The Americans supply the inhabitants with grain and different sorts of provisions.

^a Population, 10,381; 5462 whites, 4919 black slaves.—*Morse*.

^b Official Reports in the *Courier*, 30th Dec. 1815.

^c About 300 houses.—*Morse*

^d *Voyages intéressans*, par M. N**., Paris, 1788.

The population may be estimated at 10,000 souls over an extent of 12,161 acres; in this number there are 4755 whites, and 4794 black slaves.^{a b} The town of St. George, in the island of the same name, contains 250 houses.^c Hamilton is at present an inconsiderable town. The frequent hurricanes to which they are exposed, have obliged the settlers to build low houses.^d English laws are in force, and the legislative power is vested in a general council.^e The Spaniards have regretted the loss of these islands, on account of the convenience of their harbours. They were discovered, according to the common opinion, in 1557, by Juan Bermudez, but it is probable that they were known in 1515 under the double name of Bermuda and la Garça.^f There are now very few cattle in this country; even the breed of black hogs that were left by the Spaniards has greatly decreased. The tempests that prevail in these islands made the first visitors give them the epithet of *Los Diabolos*. Sir George Summers, by his account of them, induced some of his countrymen to emigrate, and several British royalists went thither at the time of the Commonwealth. Waller has celebrated these "fortunate isles," which afforded him an asylum. It is said that the English ladies wore, in honour of the poet, bonnets made from the leaves of the Bermuda palmetto.

^e The Bermudas, like the other British provinces, have a governor, council, and house of assembly.—P.

BOOK LXXIX.

THE DESCRIPTION OF AMERICA CONTINUED.

United States—Nature of the Country—Mountains, Rivers, Animals, Plants, &c.

WE now approach a more genial climate, where the forests put forth a vigorous vegetation, and the fields are covered with abundant harvests. In this region man is every where occupied in building houses, in founding cities, in clearing new lands, and in subjugating nature. We hear, on all sides, the blows of the axe, and the blasts of the forge: we see ancient forests delivered to the flames, and the plough passing over their ashes. We observe smiling cities, temples, and palaces, rise up within a short distance of cabins inhabited by Indian savages. We now tread the soil of federal America, that land of liberty, peopled by numerous colonies whom oppression and intolerance forced to leave the British isles, and the other parts of Europe.

It is but forty years since the revolutionary war closed, and the United States took their station among the independent powers of the civilized world. From the peace of 1763, which rendered England master of all North America as far as the Mississippi, the colonies began to feel their strength. The attempts of the mother country to tax them, without the consent of their own representatives, kindled the flames of insurrection. The spirited resistance made at Bunker's Hill in 1775, showed that the Americans would not be easily conquered, if they found an able leader,—as they did find in the brave and prudent Washington. Soon the wisdom of Franklin was employed in fixing the basis of a free constitution, and the independence of the States was proclaimed on the 4th July, 1776. France and Spain concluded an alliance with the new republic, and the English, after having witnessed the humiliation of their arms by the defeats of Burgoyne and Cornwallis, were constrained to acknowledge the independence of the colonies in November, 1782.^a Since this period, their progress has been unexampled. There were thirteen States in the Union when the war commenced, and there are now twenty-four; and their population, which then amounted to two millions and a half, is now ten millions. In 1803, they acquired by purchase the vast territory of Louisiana,—under which name was then included all the exten-

sive region, north of Mexico, lying between the Mississippi and the Rocky Mountains. They claim also, in virtue of the right of discovery, the country on the west side of these mountains, watered by the River Columbia, and bounded on one side by the Pacific Ocean. And, in 1821, they obtained East and West Florida from Spain by cession.

The territory claimed by the United States extends from the 25th to the 49th parallel of north latitude, and from the 67th to the 124th degree of west longitude^b from London. Its extreme length, from the Pacific Ocean to Passamaquoddy Bay, is 2780 English miles; its greatest breadth, from the shore of Louisiana, to the river La Pluie,^c is 1300 miles; and its area, about 2,300,000 square miles. On the east it is bounded by the Atlantic Ocean. On the north-east, a conventional line divides it from New Brunswick, extending from Passamaquoddy Bay northward to the 48th parallel, embracing the head waters of the River St. John,—of part of which tract, however, the British dispute the right of possession.^d From this extreme northern point, the boundary line passes along the ridge of mountains south-westward to the 45th parallel, and then along this parallel till it strikes the St. Lawrence 120 miles below Lake Ontario. It then follows the river and the chain of Lakes, Ontario, Erie, St. Clair, Huron, and Superior, proceeding from the last by the course of the River La Pluie to the 95th degree of west longitude, from which point it passes along the 49th parallel to the Rocky Mountains. On the west side of the mountains, the Americans have an unquestioned claim to the country from the 42d to the 49th parallel; and a more doubtful claim, which is disputed by Russia, to the country from the 49th to the 60th parallel.^e On the south, the territories of the republic are bounded by the Gulf of Mexico; and on the south-west, the boundary extends in a zigzag line from the mouth of the River Sabine to a point in the Rocky Mountains, in north latitude 42°, and west longitude 108°, from which it passes along the 42d parallel to the Pacific Ocean. The Mississippi divides into two parts, very nearly equal, this vast region, which greatly surpasses in extent the Macedonian, Roman, or Chinese empires.^f The population, however, is yet comparatively small.

^a The provisional articles of peace between the United States and Great Britain were signed, Nov. 30, 1782; the definitive treaty, Sept. 3, 1783.—P.

^b 66° 49' to 125° W. long.—Morse.

^c Rainy River.

^d This territory, in dispute, is now the subject of a negotiation. The claims of the parties have been recently referred to the umpirage of the Netherlands. The U. States claim the literal terms of the treaty: N. from the source of the St. Croix to the highlands dividing the waters which flow into the Atlantic from those which flow into the St. Lawrence, and along those highlands to the source of the Connecticut; thus including all the upper part of the St. John's. The British claim the

country on the upper part of the St. John's, as a part of New Brunswick, and as having been long under the actual jurisdiction of that province. They contend that the line should be drawn along the ridge dividing the waters which flow into the St. John's from those which flow into the Atlantic, in Maine. Difficulties have lately arisen in consequence of an American settlement, within the disputed limits, on the Aroostic, a S. branch of the St. John's.—P.

^e The boundary between the United States and Russia has been recently fixed at 54° 40' N.

^f "China Proper."—M. B. The whole Chinese empire, including Chinese Tartary, Thibet and Corea, is more extensive than the territories of the United States.—P.

The Indian tribes, continually forced back by the advancing tide of white population, are fast disappearing from the eastern section of the United States. Custom has reconciled some of them to live among the civilized inhabitants, and to adopt some of their modes; but more generally they sell their lands when the white settlers approach their residence, and retire farther into the wilderness. Dr. Morse states, as the result of his inquiries, that there are 8337 Indians in New-England, New-York, and Pennsylvania; 120,283 in the country east of the Mississippi altogether; and about 457,000 in the whole territories of the United States.^{a b}

Two great chains of mountains traverse the territory of the United States, in a direction approaching to south and north; the Alleghany Mountains on the east side, and the Rocky Mountains on the west. They divide the country into an eastern, a western, and a middle region, the latter comprising the great basin or valley of the Mississippi.

The Alleghanies are less a chain of mountains than a long plateau, crested with several chains of mountains or hills, separated from each other by wide and elevated valleys. East of the Hudson, the mountains are chiefly granitic, with rounded summits, often covered at their tops with bogs and turf, and distributed in irregular groups without any marked direction. Some peaks of the Green Mountains in Vermont, and the White Mountains in New Hampshire, rise to the height of 5000 or 6000 English feet above the level of the sea.^c After we pass the Hudson, the structure of the mountains appears to change. In Pennsylvania and Virginia, they assume the form of long parallel ridges, varying in height from 2500 to 4000 feet, and occupying a breadth of a hundred miles. In Tennessee, where they terminate,^d they again lose the form of continuous chains, and break into groups of isolated mountains, touching at their base, some of which attain an elevation of 5000 or 6000 feet.^e

The Rocky Mountains are upon a much grander scale than the Alleghanies. Their base is three hundred miles in breadth; and their loftiest summits, which are covered with eternal snow, rise to the height of 12,000 feet. They are placed at the distance of 500 or 600 miles from the Pacific Ocean; but between them and the coast there is another chain of mountains, of considerable elevation, but of which little is yet known.^f

On the west side of the Mississippi, and about midway between the Rocky Mountains and the Alleghanies, lies a broad range of mountains, called the Ozarks, six or seven hundred miles in length, about one hundred broad, and having an elevation varying from 1000 to 2000 feet above the sea. This range of low mountains, which is penetrated by two branches of the Mississippi, the Arkansas, and Red River, was nearly altogether unknown till within these few years, and has not been delineated, so far as we know, in any maps hitherto published in this country.

Mr. Maclure, an American geologist, informs us that a

^a The statement is given in Niles' Register for 15th June, 1822, and is ascribed to Dr. Morse.

^b Dr. Morse, in his Indian Report, estimates the Indians in New-England and New-York at 7431; in the country east of the Mississippi, at 120,316; and in the whole territory of the United States at 471,136. See page 232.—P.

^c Height of Mount Washington, in the White Hills, 6234 feet; that of Mansfield Mount, the highest in Vermont, 4279 feet.—P.

^d The Alleghanies terminate in the N. part of Georgia.—P.

^f Mellish, p. 21.

zone of primitive rocks extends from the mouth of the St. Lawrence to the confines of Florida, varying in breadth from twenty to a hundred and fifty leagues, following the shores of the Atlantic, but with an alluvial zone interposed between it and the coast, from Cape Cod to the Gulf of Mexico. This primitive zone rises, with declivities more or less steep, towards the crest of the eastern chain of the Alleghanies. It consists of granite, gneiss, mica slate, and clay slate, primitive limestone and trap, serpentine, porphyry, sienite, quartz, flinty slate, primitive gypsum, whet slate, &c. The strata dip generally to the south east, at an angle of more than 45 degrees, forming mountains sometimes with round tops, as the *White Hills*, and sometimes with pyramidal summits, as the *Peaks of Otter*. Metals and minerals abound in this zone. There are found in it the garnet, staurotide, epidote, various magnesian stones, the emerald, graphic granite, adularia, the tourmaline, amphibole, arragonite, martial pyrites in the gneiss, magnetic iron oxide in the amphibolic rocks,⁵ hematite, plumbago, molybdena, white cobalt, gray copper, sulphuret of zinc, and three varieties of titanium.

This primitive zone, continues Mr. Maclure, is not unmixed with other rocks. It is traversed in the direction of its length by a small zone of secondary rocks, from fifteen to twenty-five miles broad, which is first seen in the lower part of the valley of Connecticut River, re-appears on the west side of the Hudson, crosses the Raritan, Delaware, Schuylkill, Susquehannah, and Potomac, and terminates at the Rappahannock in Virginia.^b This secondary formation, enclosed as it were among the primitive rocks, is composed of old red sandstone, limestone, silicious conglomerate, mixed with quartz pebbles,ⁱ together with amphibolic rocks^k and wacke, usually covering the sandstone on the heights. A narrow belt of transition rocks, about fifteen miles broad at its north, and two miles at its south end, extends from the Delaware to the sources of the Roanoke, skirting the eastern side of the secondary formation, as far as the Potomac, where it crosses it, and then skirting its western side. This belt of transition rocks is composed of a fine grained limestone, alternating with strata of gray-wacke, and mixed with dolomite, flint,^l white granular marble, and calc-spar. Between the secondary and transition rocks,^m there is, about twelve miles from Richmond, a bed of coal twenty miles long, and ten broad, reposing in an oblong basin on the granite, mixed with whitish sandstone and slate clay (shale,) and containing impressions of vegetables.ⁿ

Independently of this partial transition formation, Mr. Maclure has traced a zone of transition rocks immediately on the west side of the primitive, with a breadth varying from twenty miles to forty, and dipping to the west at an angle of forty-five degrees.^o This zone, generally speaking, occupies the middle of the chain of the Alleghanies, but traverses it near the south end, and disappears in the plains of Florida. The transition limestone, the gray-

⁵ "Roche amphibolique," greenstone. The magnetic iron of the U. States is usually found imbedded in granite or gneiss, sometimes, as at Franconia, N. H. accompanied with hornblend (*amphibole*).—P.

^o In many places less than 45°.—*Cleveland*.—P.

wacke and the silicious slate, are generally found in the valleys, while the quartz aggregates, among which are found millstone rock, and the fossil remains of quadrupeds and marine animals, form the mass of the mountains. This zone presents scarcely any other minerals than iron pyrites, galena, and some beds of anthracite, accompanied by aluminous schistus, and veins of sulphate of barytes.

A secondary formation, commencing beyond this last, extends westward, over a vast space, to the lakes and the Rocky Mountains. The strata are almost horizontal, except where they undulate with the surface. They consist of old red sandstone, stratified limestone and gypsum of two different periods, tertiary sandstone, rock salt, chalk, coal, and stratified trap or basalt of a recent origin. The basis of all these strata appears to be an immense bed of secondary limestone of all shades. The western declivity of the Alleghanies presents also a large bed of coal, accompanied by sandstone and slate clay, which extends from the sources of the Ohio to those of the Tombigbee. This formation contains few minerals. Clay ironstone, and martial pyrites, are found in it.

The alluvial zone, which skirts the coast from Cape Cod to the mouth of the Mississippi, and which extends along the banks of that river, beyond the confluence of the Missouri, consists generally of beds of sand, clay, and travelled soil, mixed with deposits of shells, whose succession and thickness indicate the periods the surface had been covered by the ocean. But the entire zone is properly divided into two subordinate zones—the one very little raised above the level of the sea, and traversed by the tidewater in the rivers—the other commencing at from sixty to a hundred miles from the sea, by a series of sandy eminences, a hundred and fifty or two hundred feet high, behind which we find an undulating surface, and some travelled masses of rock. It appears that this more elevated zone, increasing in width as it proceeds southward, forms the spine of the peninsula of East Florida. The lowest parts of both zones are composed of a fertile soil deposited by the rivers.

The Ozark mountains are similar in structure to the Alleghanies. Primitive rocks, granite, and clay slate, are found on their east side. These are covered by transition rocks, which are followed by coal and other secondary formations. At the few points where the Rocky Mountains have been examined, they are found to consist of primitive rocks, granite, gneiss, quartz rock, &c. with an extensive formation of old red sandstone at their foot on the east side.^a

In our account of Canada, we have described the great lakes of fresh water which extend along the northern frontier of the United States, and were the scene of some bloody contests between the English and the Americans in the last war. Of the smaller lakes, Lake Champlain, 128 miles long, and 12 broad,^b is the only one considerable enough to require notice in this work. There are several extensive swamps or marshes, of which those called the Dismal Swamps, are the largest on the eastern side of the mountains. The name is applied to two marshy tracts, one on the north and the other on the south side of Albermarle Sound, in North Carolina. The former, which covers

150,000 acres, bears a growth of cedar and cypress in the wet parts, and of white and red oak and pine in the dry parts. The other, which is still larger, and also covered with wood, has a lake in the middle of it. Both afford some excellent rice grounds. The Great Swamp, lying on the west side of the Mississippi, 200 miles long, and 20 broad, becomes a lake in the beginning of summer, when it receives a part of the overflowing waters of that river; but the waters gradually dry up, and it then exhibits a parched surface, thickly covered with cypress.

We have already described the St. Lawrence in our account of Canada. The Mississippi is a still more celebrated stream; but it is now known that the Missouri is the principal branch, and has the best claim to the magnificent title of "Father of waters," conferred on the smaller branch by the Indians. Of the Missouri we shall speak afterwards. The Mississippi proper, has its source in Turtle Lake, near the 48th degree of north latitude. At the picturesque Falls of St. Anthony it descends from the plateau, where it has its origin, to a vast plain, which accompanies it to the sea. After a course of 280 leagues its limpid waters are blended with the turbid stream of the Missouri. At the point of confluence each of these rivers is nearly half a league broad. Above the mouth of the Missouri, the most considerable rivers are, the St. Peter's and Des Moines on the west side, the Wisconsin, Rock River, and the Illinois, on the east. At the distance of 160 miles below the mouth of the Missouri, it is joined by the Ohio, after the latter has received the tributary waters of the Wabash, the Cumberland, and the Tennessee rivers. Lower down, the Mississippi has its volume augmented by the Arkansas and Red River, and falls into the Gulf of Mexico, after a course of 2500 miles. The river, in the last part of its course, presents some peculiar phenomena. Besides its principal and permanent mouth, it has several lateral outlets, called Bayous, which carry off part of its waters. In Louisiana, the surface of the stream is more elevated than the adjoining lands. Its immense volume of waters is confined and supported by dykes or levees, composed of soft earth, and rising a few feet above the usual height of the inundations. These banks of the river, which decline gradually into the swampy plains behind, are from a quarter to half a mile in breadth, and form the richest and best soil in the country. The three principal outlets or bayous, called the Atchafalaya, the Lafourche, and the Ibberville, embrace an extensive delta, composed of soft, swampy earth, rising very little above tidewater. The actual embouchure of the river parts into three branches, each of which has a bar at its entrance, the deepest affording only seventeen feet water. Within the bar, the depth of the river, for two or three hundred miles, is from 50 to 150 feet. The average breadth of the Mississippi, below its junction with the Missouri, is about 1000 yards, or two thirds of a mile.^c

The Mississippi and its branches traverse countries thickly wooded, and hence vast numbers of trees, either uprooted by the winds, or falling from the effects of age, are borne down by its waters. United by lianas, and cemented by soft adhesive mud, these spoils of the forest become floating islands, upon which young trees take root. There the *Pistia* and the *Nenuphar* display their yellow

^a James's account of an Expedition from Pittsburgh to the Rocky Mountains in 1819, 1820. vol. iii. p. 238. and engraved sections.

^b Its breadth varies from half a mile to sixteen miles.—P.

^c Mellish, p. 32. Warden's Statistical Account of the United States, 1819, vol. I.

flowers, and the serpents, the birds, and the alligators, come and repose on these flowery and verdant rafts, which are sometimes carried to the sea, and engulfed in its waters. Sometimes a large tree attaches itself to a sandbank firmly, and, stretching out its branches like so many hooks, entangles all the floating objects that approach it. A single tree often suffices to arrest thousands in their course; the mass accumulates from year to year; and thus are gradually created new islands, new capes, and peninsulas, which change the course of the stream, and sometimes force it to seek out new channels.

The tides are not felt in the Mississippi, in consequence of its numerous sinuosities.^a The winds are variable; and though the prevailing wind is from the south, and favours vessels sailing against the stream, still the navigation upwards is slow and difficult, especially during the floods, when the current has a velocity of three or four miles an hour. These floods occur in May, June, and July. The additional waters form an inclined plane, the rise being 50 feet in Tennessee, 25 feet near the mouth of Red River, and 12 feet at New-Orleans. The invention of steam-boats has perhaps been nowhere so beneficial as in the navigation of this river. The voyage upwards from New-Orleans to the Falls of Ohio, which often occupied sailing vessels three months, may now be accomplished in steamboats in fifteen or eighteen days.

We shall mention very briefly the other considerable rivers of the United States. The Bay of Mobile receives the waters of the Alabama, which has two large branches, the Alabama proper, and the Tombigbee. Farther east is the Apalachicola. The only large river in Florida is the St. John's, which rises in a marsh, and flowing northward parallel to the coast, falls into the Atlantic. The Alatomaha, Savannah, Santee, and Peedee, are the most considerable rivers in Georgia and South Carolina. They are all navigable to a considerable distance, but have their mouths, less or more obstructed by sand bars. The entrance into Cape Fear River, the Neuse, and Roanoke, is still more difficult, in consequence of the line of sand banks which cover the whole coast of North Carolina. Hence Albermarle Sound, and Pamlico Sound, are properly mere lagoons, to which ships find access only by one or two inlets,^b too narrow and dangerous to be attempted except in favourable weather. To the north of Cape Henry, extends the magnificent Bay of Chesapeake, 180 miles long,^c which receives James's River, the Potomac, and the Susquehannah. The Delaware falls into a bay of the same name. The Bay of New-York receives the Hudson, a large river, in which the tide ascends 160 miles, and which is the scene of a most extensive and active inland commerce. The most considerable rivers east of the Hudson are the Connecticut, the Merrimack, the Kennebeck, and the Penobscot. The small River St. Croix separates the territories of the United States from New Brunswick.

The climate of the United States is remarkably inconstant and variable. It passes rapidly from the frosts of Norway to the scorching heats of Africa, and from the humidity of Holland to the drought of Castile. A change of 20° or 25° of Fahrenheit, in one day, is not considered

^a Or rather on account of the velocity of the current.—P.

^b Ocracoke is the only inlet which admits vessels of burden.—P.

^c 200 miles long.—Morse.

^d It may be proper to mention, that the name of New-England was applied at an early period (and is still in use) to all the states east of

extraordinary. Even the Indians complain of the sudden variations of temperature. In sweeping over a vast frozen surface, the north-west wind acquires an extreme degree of cold and dryness, and operates very injuriously on the human frame. The south-east, on the other hand, produces on the Atlantic coast effects similar to those of the Sirocco. The south-west has the same influence in the plains to the east of the Alleghanies: when it blows, the heat frequently becomes painful and suffocating. In the mountains, however, where the summer heat is moderate, even in the southern states, the fresh and blooming complexion of young persons, is a proof of the purity and salubrity of the atmosphere. The same ruddy complexion prevails in New-England^d and in the interior of Pennsylvania; but the pale countenances of the inhabitants of all the low country, from New-York to Florida, reminds a stranger of the Creoles in the West India Islands. In this region malignant fevers are prevalent in September and October. The countries situated to the west of the Alleghanies are in general more temperate and healthy. The south-west wind there brings rain, while the same effect is produced on the other side of the mountains by the north-east wind. But the north-east wind, which covers the Atlantic coast with thick fogs, is dry and elastic on the banks of the Ohio. When we compare the climate on the opposite sides of the Atlantic, we find that the extremes of temperature are greater, and particularly that the winter's cold is more severe on the west side than on the east. The mean temperature of the year, according to Humboldt, is 9 degrees (Fahr.) lower at Philadelphia than in the corresponding latitudes on the coast of Europe. The mouth of the Delaware is shut by ice for six weeks, and that of the St. Lawrence for five months in the year. Throughout the United States, the rains are sudden and heavy, and the dews extremely copious. Storms of thunder and lightning are also much more common and formidable than in Europe.^e

A climate so variable, and subject to such extremes of temperature, must favour the introduction of that pestilential disease, the yellow fever, which has renewed its ravages so often during the last thirty years in the ports of the southern and middle states. It is the same distemper with the black vomit of the Spaniards, and the Matlazahault of the Mexicans. It seems to be endemic in the low and marshy countries of tropical America.

From the shores of the Atlantic to the Mississippi, the United States present an immense natural forest, interspersed however with open and naked plains, called *prairies*, which are numerous on the west side of the Alleghanies, but very rare on the east side. In the country on the west side of the Mississippi, wood is comparatively scarce; and in the arid and desert plains, occupying a breadth of three or four hundred miles on the east side of the Rocky Mountains, only a few trees are seen along the banks of the rivers. In the inhabited part of the United States, the lands cleared and cultivated probably do not exceed one-tenth part of the surface. There is a diversity in the American woods, according to the climate, soil, and situation of the different districts; and some naturalists have distinguished the vegetation of the United States into five regions.^f

the Hudson. It embraces the six states of Massachusetts, Rhode Island, Connecticut, New Hampshire, Vermont, and Maine.

^e Volney, Tableau du climat et du sol des Etats Unis.

^f "On peut diviser la végétation de l'Amérique Unie en cinq régions." The vegetation of the United States may be distinguished into five regions.—M. B.

1. *The region of the north-east*, bounded by the course of the Mohawk and the mouth of the Connecticut River, where firs, pines, and the other evergreens of Canada, prevail. 2. *The region of the Alleghanies*, where the red and black oak, the beech, the balsam poplar, and the black and red birch, often overshadow the plants and shrubs of Canada, at least as far as North Carolina. The valleys among these mountains are remarkably fertile in corn. 3. *The upland country*, extending from the foot of the mountains to the lowest falls of the rivers; here the prevailing trees are the red maple, the red and black ash, the walnut, the sycamore, the acacia,^a and the chesnut. To the south, the magnolia, the laurel,^b and the orange, are interspersed through the forest. Tobacco, with the indigo and cotton plants, succeed as far north as the Susquehannah, beyond which, pastures prevail. 4. *The region of maritime pines*, which extends along the Atlantic coast from the sea to the first elevations; the long-leaved pine, the yellow pine, and the red cedar, occupy the dry grounds, and the cypress with acacia leaves,^c the low and moist soils, as far as the Roanoke, or even the Chesapeake; farther to the north we find the white pine, the black and Canadian fir, and the *Thuja occidentalis*. The rice grounds commence where the tidewater becomes fresh, and terminate where it ceases to be felt. 5. *The western region*, which no doubt admits of sub-division, but in which, generally speaking, the forest trees are, the white oak, the black and shellbark walnut, the hickory walnut, the wild cherry, the tulip tree, the white and blue ash, the nettle tree, the sugar maple, the white elm, the linden tree,^d and the American plane tree,^e which all grow to a greater size than on the Atlantic coast.

But the varying altitude of the ground necessarily blends the characters of these different regions. Looking, therefore, at the forests of the United States as a whole, the most universally diffused trees are, the willow-leaved oak^f which grows in the marshes; the chesnut oak,^g which in the southern states rises to a prodigious size, and which is almost as much esteemed for its farinaceous acorns as for its wood; the white, red, and black oak. Two species of walnut also, the white, and the black, valued for the oil of their nuts, together with the chesnut and the elm of Europe, abound almost as much as the oaks in the United States. The tulip tree and the sassafras, more sensible to cold than these others, are stunted shrubs, on the confines of Canada, assume the character of trees in the middle states, but it is upon the hot banks of the Alatomaha that they develop their full growth, and display all their beauty and grandeur. The sugar maple, on the other hand, is not seen in the southern states, except upon the northern slopes of the mountains, while in the colder climate of New-England it reaches its full natural dimensions. The liquidambar, which yields an odorous gum, the ironwood (*Carpinus ostrya*), the nettle tree, the American elm, the black poplar, and the *tacamahaca*, are found growing in every place where the soil suits them, without showing any great preference for one climate more than another. The light and sandy soils are covered with the useful tribe of pines, of which the principal species are, the common fir, the beautiful hemlock fir, the black and the white pine, and the larch.^h We may

also class with this family of trees, the *Arbor vitæ* (*Thuja occidentalis*), and the American red cedar (*Juniperus Virginiana*.) Among the shrubs generally diffused in the United States we may reckon the *Chionanthus* or fringe tree, the red maple, the sumach, the poison vine (*Rhus radicans*), the red mulberry, the thorn bush (*Cratægus*), the persimmon, the locust-tree (*pseudacacia*), the honey-locust (*Gleditsia triacanthos*), &c.ⁱ

The United States, generally speaking, do not present the beautiful verdure of Europe; but among the larger herbs which cover the soil, the curiosity of botanists has distinguished the *Collinsonia*, which affords the Indians a remedy for the bite of the rattlesnake, several species of *Phlox*, the golden lily,^k and the biennial *Oenothera*, with several species of *Aster*, *Monarda*, and *Rudbeckia*.

It is in Virginia, and in the southern and south-western states, that the American flora displays its wonders, and the savannas their perpetual verdure. It is here the magnificence of the primitive forests, and the exuberant vegetation of the marshes, captivate the senses by the charms of form, of colour, and of perfume. If we pass along the shores of Carolina, Georgia, and Florida, groves in uninterrupted succession seem to float upon the waters. By the side of the pine is seen the mangrove, the only shrub which thrives in salt water, the magnificent *Lobelia cardinalis*, and the odoriferous *pancratium* of Carolina, with its snow-white flowers. The lands to which the tide reaches are distinguished from the lands which remain dry by the crowded and waving stalks of the cane (*Arundo gigantea*), by the light foliage of the *Nyssa aquatica* (water tupelo,) by the *tacamahaca*, the fringe tree, and the white cedar (*Cupressus disticha*), which perhaps, of all the trees of America, presents the most singular aspect. Its trunk, where it issues from the ground, is composed of four or five enormous buttresses, which, uniting at the height of seven or eight feet, form a sort of open vault, from the summit of which rises up a single straight stem of eighteen or twenty feet in height, without a branch, but terminating in a flat canopy, shaped like a parasol, garnished with leaves curiously figured, and of the most delicate green. The crane and the eagle fix their nests on this aerial platform, and the paroquets, which are continually hovering around it, are attracted to it by the oily seeds inclosed in the little cones suspended from the branches. In the natural labyrinths which occur in these marshy forests, the traveller sometimes discovers small lakes, and small open lawns, which would present the most seductive retreats, if the unhealthy exhalations of autumn permitted him to inhabit them. Here he walks under a vaulted roof of *smilax* and wild vines, among creeping lianas, which entangle his feet with their flowers; but the soil trembles under him, clouds of annoying insects hover around him, monstrous bats overshadow him with their hideous wings, the rattlesnake musters his scaly terrors, while the wolf, the carcajou, and the tiger-cat, fill the air with their savage and discordant cries.

The name of savannas is given to those vast prairies of the western region, which display a boundless ocean of verdure, that deceives the sight by seeming to rise towards

^a Locust-tree.

^b Bay-tree, *Laurus borbonia*.

^c *Cupressus disticha*?

^d Basswood, *Tilia*.

^e *Platanus occidentalis*, button-wood.

^f *Quercus phellos*.

^g *Quercus prinus*.

^h *Hæmatac*.

ⁱ Michaux, Voyage à l'ouest des Alleghans, et l'Histoire des arbres forestiers de l'Amérique septentrionale.

^k "Martagon."

the sky, and whose only inhabitants are immense herds of bisons or buffaloes. The name is also given to those plains which skirt the rivers, and are generally inundated in the rainy season.^a The trees which grow there are of the aquatic species. The *Magnolia glauca*, the American olive, and the *Gordonia argentea*, with its odorous flowers, are seen here isolated, or in groups, while the general surface of the savanna exhibits a long and succulent herbage, mixed with plants and shrubs. The wax myrtle^b appears conspicuous among many species of *Azalea*, *Kalmia*, *Andromeda*, and *Rhododendron*, here widely scattered, there collected into tufts, sometimes interlaced with the purple passion flower, sometimes with the capricious *Clitoria*, which decorate the alcoves with rich and variegated festoons. The margins of the pools, and the low and moist spots are adorned with the brilliant azure flowers of the *Ixia*, the golden petals of the *Canna lutea*, and the rosy tufts of the *Hydrangea*; while an infinite variety of species of the pleasing *Phlox*, the sensitive briar, the irritable *Dionea*, and the flame-coloured *Amaryllis atamasco*, in those places where the tide reaches the impenetrable ranks of the palmetto royal,^c form a fanciful girdle to the woods, and mark the doubtful limits where the savanna rises into the forest.

The calcareous districts, which form the great portion of the region west of the Alleghanies, present certain places entirely destitute of trees, called *barrens*, though capable of being rendered productive. The cause of this peculiarity has not been accurately examined. The parts of this region which are elevated three or four hundred feet, and lie along deeply depressed beds of rivers, are clothed with the richest forests in the world. The Ohio flows under the shade of the plane and the tulip tree, like a canal dug in a nobleman's park, while the *lianas*, extending from tree to tree, form graceful arches of flowers and foliage over branches of the river. Passing to the south, the wild orange tree mixes with the odoriferous and the common laurel. The straight silvery column of the papaw fig, which rises to the height of twenty feet, and is crowned with a canopy of large indented leaves, forms one of the most striking ornaments of this enchanting scene. Above all these towers the majestic *magnolia*,^d which shoots up from that calcareous soil to the height of more than a hundred feet. Its trunk, perfectly straight, is surmounted by a thick and expanded head, the pale green foliage of which affects a conical figure. From the centre of the flowery crown, which terminates its branches, a flower of the purest white rises, having the form of a rose, and to which there succeeds a crimson cone: this, in opening, exhibits rounded seeds of the finest coral red, suspended by delicate threads at least six inches long. Thus, by its flowers, its fruit, and its gigantic size, the magnolia surpasses all its rivals of the forest.

A general Land Office exists at Washington, which is vested exclusively with the power of contracting with the Indians for the sale of their lands.^e Private individuals are not allowed to have any transactions of this description with the natives; and the law has been rigorously observed. In 1813 there were 148,876,000 acres of land,

of which the Indian title had not been extinguished, on the east side of the Mississippi, situated chiefly in Michigan, the North West Territory, Indiana, Illinois, and in Mississippi. The lands are surveyed and set off into townships of six miles square, each of which is divided into thirty-six sections of one mile square, or 640 acres. The dividing lines run in the direction of the cardinal points, crossing one another at right angles. One section, or one thirty-sixth part of each township, is allotted for the support of schools, and in the country west of the Alleghanies seven entire townships have been given, in perpetuity, for the endowment of superior seminaries of learning: The lands are offered to public sale, in quarter sections, of 160 acres, at the *minimum* price of one and one fourth dollar per acre, and whatever remains unsold, may be purchased privately at this price. Formerly, the minimum price was two dollars per acre, payable in four years, by four instalments; but by act of Congress, in 1821, it was fixed at one and one fourth dollar ready money. This new regulation was adopted to discourage the practice of speculating in land, and to lessen the litigation arising out of protracted payments. The title deed is printed on a small sheet of parchment, with the date; the purchaser's name, and the topographical situation of the ground, are inserted in writing. It is subscribed by the President of the United States, and the Agent of the Land Office, and delivered without charge to the purchaser, who may transfer the property to another person by a process equally cheap and simple.^f

It was estimated by Hutchins, that thirteen sixteenths of the country east of the Mississippi (excluding Florida) are covered with a strong fertile soil, fitted, with a moderate degree of cultivation, abundantly to repay the labours of the husbandman. Of the remaining three sixteenths, about 57,000,000 acres are covered with water; about 40,000,000 acres consist of a mountainous country, almost universally forested, and which, from the nature of its surface, rather than its soil, is unfit for cultivation; and about 29,000,000 acres are either sandy, or covered with so poor a soil, as to offer slight encouragement, except to the most elaborate agriculture, when the general value of land shall be greatly advanced. Of 520,000,000 acres capable of advantageous cultivation, only 40,950,000 were estimated by Mr. Blodget, to be under actual improvement in 1811. This is about $5\frac{3}{4}$ acres for each individual of the contemporaneous population. Taking the present population at ten millions, and allowing the same quantity for each person, the land under actual improvement must now be nearly 60,000,000 of acres, which is about one twelfth part of the whole surface east of the Mississippi, including Florida. According to returns made in 1793, the land valued, and upon which tax was paid in sixteen states, was 163,000,000 out of 308,000,000 acres, or a little more than one half, and the estimated value was 479,000,000 of dollars. The population then being about five millions, the *appropriated* land amounted to about thirty acres for each inhabitant. The average value was about three dollars per acre, but in some of the old and thickly settled states, it was as high as fifteen dollars per acre. The value of the houses was about 140,000,000 of dollars, or two sevenths of that of the lands.

^a The term *savanna* is more generally applied to the low open plains, particularly in the southern states; the dry open plains are called *prairies*.—P.

^b *Myrica cerifera*.

^c *Yucca gloriosa*.

^d *Magnolia grandiflora*.

^e The business of the Land Office is the survey and sale of the public lands. These lands are purchased of the Indians by treaty with the government of the U. States.—P.

^f Warden's Statistical, Political, and Historical Account of the United States, 1819. III. 237. Fint's Letters from America, 1822. p. 153. 314.

When returns were made a second time in 1814, the value of houses and lands jointly, was found to be 1,630,000,000 of dollars; if, therefore, the value of every species of property grew as rapidly as that of houses and lands, each 100 dollars must have increased to 253 in an interval of fifteen years. This implies an annual augmentation of $6\frac{1}{3}$ per cent. at which rate the capital of the country must double in eleven or twelve years—in other words, the capital is increasing with twice the velocity of the population.

In a country having so many varieties of soil and climate as the United States, there is necessarily a considerable diversity in the agricultural productions. Maize, or Indian corn, is cultivated in all parts of the country, but succeeds best in the middle states. It is a most useful vegetable, fitted to a greater variety of situations than wheat, and yielding generally double the produce. Wheat is also raised in all parts of the country, but thrives best in the middle and western states. The cultivation of Tobacco begins in Maryland, about the thirty-ninth or fortieth parallel, and continues through all the southern, and partially through the western states. It forms the staple of Maryland and Virginia. Cotton grows as far north as 39° , but its cultivation is not profitable beyond the latitude of 37° . This useful plant was first raised for exportation only in 1791. It is now produced in immense quantities from the River Roanoke to the Mississippi, and forms the leading export of the United States. The best grows in dry situations in Carolina and Georgia upon the sea coast. The rice crops, which require great heat, and a soil susceptible of irrigation, commence about the same parallel, and have nearly the same geographical range. The sugar-cane grows in low and warm situations, as high as the latitude of 33° ; but the climate favourable to its cultivation does not extend beyond $31\frac{1}{2}^{\circ}$. It is now cultivated to a great extent in Georgia, Alabama, Mississippi, and Louisiana. Dr. Morse states, that in Louisiana alone 20,000,000 of pounds of sugar were raised in 1817, when the whole quantity consumed in the republic was estimated at 70,000,000 of pounds. Oats, rye, and barley, are raised in all the northern and middle states. The oats are used for horses food, the barley chiefly for breweries, and the rye for distillation.^a Hemp and flax are raised in the western states.^b The vine thrives as far north as Pennsylvania, but home wines are only made yet to a very limited extent. Natural meadows are more numerous in New-England and New-York than in the parts farther south. Pennsylvania is distinguished by its superior breeds of horses and horned cattle. Merinos of full and mixed blood are now spread over the northern, middle, and western states.^c

The bison, American ox, or buffalo, though it has an eminence on its back, is a distinct species from the zebu

of India and Africa, and the slightly humped aurochs of northern Europe. The American ox has always the neck, the shoulders, and the under part of the body, covered with long woolly hair; it has a long beard under the chin; and the tail does not reach to the houghs. It differs widely also from the small musk ox of the extreme northern parts of the American continent, which has a resemblance, in the singular form of its horns, to the buffalo of the Cape. The moose-deer, which is found from the Rocky Mountains to the Gulf of St. Lawrence, is now rare in the inhabited parts of the United States. It is a gigantic animal, sometimes twelve feet high. The elk, the red deer, and the caribou, which is probably the reindeer, are also found.^d There are two species of bear, the one short-legged, living chiefly on vegetables, the other called the ranging bear, which destroys calves, sheep, pigs, and sometimes children. The wolf is also found in all the states, and is very destructive to cattle. The catamount, of the size of a large dog, and the spotted tiger, five or six feet long, both voracious animals, are rare. The cougar, or American panther, is more common.

No mines of gold^e or silver of any importance have yet been discovered in the United States; but the useful metals are in general abundantly distributed. Some of the ores of iron are found in almost every state; and mines of this metal are worked in New Hampshire, Vermont, Rhode Island, New-York, Connecticut, New-Jersey, Pennsylvania, Virginia, and North Carolina. The number of furnaces, forges, and bloomeries, in 1810, was 530, and the value of the iron manufactured annually, was estimated at twelve or fifteen millions of dollars. The United States are supplied with copper chiefly from Mexico and other foreign countries, but ores of this metal exist in most of the states, and in the North-West Territory are said to be in great abundance in situations of easy access. Lead is chiefly procured from Missouri, where forty-five mines are worked, and yield three millions of pounds annually. Of coal there is a large field twenty miles long by ten broad, twelve miles from Richmond, which has been long worked. This useful mineral is also found at various places in New-England, New-York, and Pennsylvania. But the most abundant supply is on the west side of the Alleghanies, where a coal formation, one of the largest in the world, extends, with some interruption, from the western foot of the mountains across the Mississippi. Salt is chiefly obtained from the sea, or imported in the eastern States; but brine springs abound over the great valley of the Mississippi, from the Alleghanies to the Rocky Mountains, and in some situations on the western side of the valley, plains occur of many miles in circuit, which are periodically covered with a thick crust of salt.^f ^g

^a Rye is generally used for bread-corn in the eastern states.

^b Flax is cultivated generally in the northern and eastern states for domestic use.

^c Warden's Introduction, p. 29.

^d The following are the species of deer found in the U. States: the moose deer, (the European elk;) the wapite, red deer, or American elk: the common American deer; and the mule deer, on the Missouri.—P.

^e Gold is found extensively in the upper country of N. Carolina, and in some few points in the adjacent parts of Virginia and S. Carolina. It is found in alluvial deposits, and has been lately wrought to a considerable extent.—P.

^f Warden's Introduction. Morse, I. 282.

^g The salt springs, at Salina, in New-York, produced, in 1800, 42,754 bushels; in 1823, 606,463 bushels; in 1824, 820,962 bushels; in 1825, 736,622 bushels.—P.

BOOK LXXX.

AMERICA.

Description of the United States continued.—Topography and Statistics of the several States.

HAVING described the limits and extent of Federal America generally, and completed our sketch of its physical geography, we have now to speak a little more in detail of the several states which compose the republic.

The American Federation embraces at present (1824) *twenty-four* distinct states, each ruled by its own government; *three* territories, in which civil governments are established without constitutions; and *three* other territories yet unoccupied by a civilized population.^a A view of the extent, population, commerce, &c. of the whole, will be found in the tables subjoined to this article.

If we attend to the distinctions which exist among these various states and territories, founded on their physical circumstances, or the pursuits and character of the people, we may class them into four grand groups; first, New-England, embracing the six states east of the Hudson, which is the most thickly peopled, and the most commercial section of the Union. Second, the middle states, including New-York, Pennsylvania, New-Jersey, Delaware, and Maryland, in which the agricultural character is united with, and qualified by the commercial. Thirdly, the southern states, including Virginia and all the maritime country to the Mississippi, where the amount of commerce is comparatively small, where slaves are numerous, and the husbandmen are generally planters. Fourth, the western states, in the basin of the Ohio, enjoying the best soil and climate in the United States, where there are few slaves, and where the character of the people is almost purely agricultural. We shall begin with the first class.

Maine embraces an area of 32,000 square miles. It contains much poor soil along the coast, and many barren mountains in the interior. The climate, though severe, having five months of frost and snow, is remarkably healthy. Wheat, rye, oats, and barley, are cultivated, but pasturage and the feeding of cattle are leading objects of attention. The manufactures are chiefly domestic, and were estimated at 2,138,000 dollars in 1810. The inhabitants carry on commerce with much activity, and possess a greater amount of tonnage than the state of Pennsylvania. The chief exports are timber and fish. Maine was a dependency of Massachusetts till 1820,^b when it received a constitution as an independent state, and became a member of the federal body. The population, which in 1790

amounted only to 96,540, was found to be 298,335 in 1820. Portland, its chief town, which has a fine harbour, contained at the last mentioned date 8581 inhabitants. The Governor, Senate, and House of Representatives, are all elected annually by the male inhabitants of the age of twenty-one and upwards. There are schools in almost every township, besides twenty-five academies in the more populous places. The prevailing religious sects are the congregationalists and baptists. There are some methodists, episcopalians, catholics, and universalists. The people are moral, active, industrious, and enterprising.^c

New-Hampshire lies between Maine, Vermont, and Massachusetts, and embraces an area of 9280 square miles. The surface in the interior rises into mountains, which are clothed with wood, except their highest summits. The ground is in general very fertile: the uplands afford rich pastures, and the interval lands, along the rivers, heavy crops of hay and wheat. In the natural state, the varieties of soil are distinguished by the growth of wood. Thus, white oak and chesnut indicate a soil that is hard and stony; pitch pine one that is dry and sandy; white pine a soil light and dry, but deeper; spruce and hemlock a thin, cold soil; beech and maple a warm, rich, loamy soil. It is observed that winter rye thrives best on new land, and maize or barley on old. The climate is severe but healthy: the ice lasts three months on the lakes and rivers, which are then crossed by loaded wagons. The state has only eighteen miles of sea coast, in which is one excellent harbour, that of Portsmouth. It is chiefly an agricultural state, and has but little commerce. It has considerable manufactures of iron, cotton, and woollen, &c. the whole annual value of which in 1810 was estimated at 8,135,027 dollars. It has one college, which is not very numerously attended, about twenty academies, and by law every town is obliged to have one or more common schools. The inhabitants, who amounted to 141,885 in 1790, and to 244,161 in 1820, have the general character of the New-Englanders. They are tall and strong, industrious, well informed, and enterprising, frugal, religious, and jealous of their rights. Portsmouth, the largest town in the state, had 7327 inhabitants in 1820. The Governor, Senate, and House of Representatives, are all elected annually by the male, of full age, paying state taxes.

Vermont is situated between Lower Canada, New-Hampshire, Massachusetts, and New-York, and contains 10,200

^a The District of Columbia is under the immediate control of the general government.—P.

^b Rather a part of the state, having the same rights, powers, and privileges, as Massachusetts proper.—P.

VOL. II.—NOS. 77 & 78.

^c This, and the following statistical sketches of the various states, are taken from Mr. Mellish's work, ed. 1822, Dr. Morse's, ed. 1819, and Mr. Warden's book, printed in 1819, with the addition of a few facts taken from recent English travellers.

square miles of surface. It is a beautiful picturesque country, entirely inland, abounding in mountains, which are universally covered with wood,—with birch, beech, maple, ash, elm, and butternut, on the east side, and with evergreens on the west. The crops also feel the influence of these different exposures, for winter wheat, which is extensively cultivated on the west side of the mountains, does not thrive on the east. Maize, barley, oats, and flax, succeed every where, and the pastures are excellent. The snow lies three months. The number of inhabitants was 85,539 in 1790, and 235,764 in 1820. The value of its manufactures was estimated at 4,326,000 dollars in 1810. The state has two colleges, neither of which is numerously attended; it has an academy generally in each county, and common schools in all the towns. The congregationalists and baptists are the most numerous sects. Vermont was attached to New-York till 1791, when it was created an independent member of the Federal Union. Its legislature consists of a House of Representatives only, which, with the Governor, is elected annually, by all the resident males of full age. There is no Senate, but there is a council of Censors, elected once in seven years, whose business is to inquire whether the Legislature and Executive have done their duty, and whether the constitution has remained inviolate.

The state next in order as we proceed southwards, is *Massachusetts*, which embraces 7800 miles of surface. This state is uneven and hilly generally, and mountainous near its western extremity. The soil in the southern parts is sandy; in the rest of the state it is generally strong, and well adapted either for grazing or grain. The agriculture is better conducted than that of any other state, except Connecticut and Pennsylvania. The average produce, per acre, of the good lands, is estimated to be thirty bushels of maize or corn, thirty of barley, twenty of wheat, fifteen of rye, and two hundred of potatoes. The ox is more used than the horse in agriculture. The population was 378,787 in 1790, and had increased to 523,287 in 1820. Massachusetts is in fact the most densely peopled, the richest, and perhaps the most highly civilized state in the Union. It has the principal share of the American fisheries, and a greater amount of commerce and shipping than any other state.

Boston, the capital of the state, is a large handsome city, beautifully situated on a small peninsula in Massachusetts Bay, being surrounded on all sides by the sea, except where a long narrow neck connects it with the continent. The more ancient part of it is not very regular, and has very much the appearance of an old English town; but the more recent streets are spacious and regular, and the buildings generally very handsome. The harbour is one of the safest and most commodious in the United States, being secure from an enemy, and from every wind, and capable of containing five hundred ships. Boston is the seat of a very extensive commerce, both foreign and domestic, conducted by a people who unite extraordinary enterprise with great industry and perseverance. The public buildings, the wharfs, the bridges, all indicate the taste and activity of the community; and the vast capital vested in shipping, with the growing magnitude of the population, are proofs of its increasing wealth and prosperity. Boston may also be considered as the literary capital of the United States, so far as regards native publications,

though the reprinting of European works is carried on to a greater extent in Philadelphia. It has the honour, too, of being the cradle of the revolution, and of American independence. Boston contained 43,940 inhabitants in 1820.^a There are many other considerable towns, among which may be mentioned Salem, with 11,346 inhabitants, Newburyport 6852, Gloucester 6384, and Charlestown 6591.

Massachusetts is extremely well supplied with seminaries for education, and the people are universally well informed. By law every town containing fifty families is bound to maintain a common English school, and every town with 200 families must maintain a school for Greek and Latin. There are two colleges in the state—one of which, Harvard college, is the most richly endowed, and perhaps the most efficient in the United States. Its property is estimated at 600,000 dollars, (132,000*l.*) and its library contains 25,000 volumes. The congregationalists are three times more numerous in this state than any other sect. The next in number are the baptists. The religious austerity for which the Bostonians were formerly distinguished, has been greatly softened down, though it was not till 1798 that a theatre was opened in the town. Throughout this state, and in other parts of New-England, unitarian doctrines are said to be making rapid progress. The government of Massachusetts is vested in a Senate and House of Representatives, chosen annually by all the male citizens of full age who pay taxes.

Rhode Island is the smallest state in the union, its area, which is 1360 square miles, not exceeding that of a middling English county. The soil is of moderate fertility, but the climate is held to be one of the most salubrious in the United States. It has a greater proportion of manufactures, in proportion to its population, than any other state, containing from 90 to 100 cotton mills, and a vast number of power looms. Its commerce is also considerable. The population of the state was 68,825 in 1790, and 83,059 in 1820. At the latter date, Providence, its chief town, contained 11,787 inhabitants. This State, unlike the other members of the federal body, has no written constitution, being still governed by the charter granted by Charles the Second, in virtue of which the people elect annually a Senate and House of Representatives, who exercise the legislative power, and a Governor who exercises the executive.

The state of *Connecticut* lies between Rhode Island, Massachusetts, and New-York, and embraces an area of 4670 square miles. The surface is undulating or hilly, the soil generally fertile. The climate, like that of Rhode Island, is very salubrious. The agriculture of Connecticut is of a very improved kind; and it abounds in manufactures of cotton, woollen, linen, leather, iron, tin, &c. It has also a considerable coasting trade, and is in all respects one of the most industrious thriving states in the Union. Its population has increased more slowly than that of any other state; being 237,946 in 1790, and 275,248 in 1820. But Connecticut and Massachusetts are the great nurseries of men for the western regions; and they send a greater proportion of emigrants across the Alleghanies than any other section of the republic. New-Haven, the capital,^b had 7147 inhabitants in 1820. The people of this state are universally well educated, common schools being estab-

Population, by census in 1825, 58,281.

lished in every town. Yale College, for the higher branches of education, is one of the most flourishing and best conducted seminaries in North America.

New-York.—New-York, which held only the fifth rank among the states in 1790, is now the most populous and powerful of the whole. It embraces an area of 46,200 miles, which is one half larger than that of Ireland, though it forms but the twentieth part of the surface of the gigantic republic east of the Mississippi. But if we estimate its importance by the intelligence of the people, their physical, moral, and commercial activity, and the wonderful spirit of improvement they display, we shall find that this small community is entitled to take precedence of many second rate European kingdoms, and of the whole empire of Mexico.

The country displays every variety of surface, from the level and undulating to the hilly and mountainous. The soil is of a mixed character: pretty good, but dry, in the south-east; poor and stony in the north-east; generally rich, but sometimes marshy, in the north-west; and hilly, but well adapted for grazing, in the south-west. The climate also is considerably diversified: it is cold in the north, towards the St. Lawrence; but milder in the south-east, and in the country lying along the southern shores of Lake Ontario. The state abounds, beyond any other, in beautiful and picturesque sheets of water. Lake Champlain, 128 miles long, and from half a mile to 12 miles broad, is chiefly in New-York. It affords good navigation, and has a considerable amount of shipping on it, including one or two steamboats. Lake George, 35 miles long, and higher by 100 feet, is beautifully situated among lofty mountains. A series of long and narrow lakes, all extending in a south and north direction,^a and surrounded by eminences richly clothed with wood, adorn the fertile country south of Lake Ontario. The largest are, Oneida Lake 22 miles long, Seneca 35 miles, Cayuga 36 miles, Canandaigua 16 miles, Crooked Lake 20 miles long, Skeneatles 14 miles, Owasco 11 miles, and Onondago 9 miles. They are almost all situated upon the courses of rivers, and are generally navigable. Wooden bridges strong enough to bear wagons are built over some of these lakes. The Americans are remarkably skilful in this sort of carpentry. One bridge, which crosses the Cayuga, is a mile in length, and cost 25,000 dollars. It is but twenty years since settlements began to be formed in this rich district, and it already possesses a large and prosperous population. "With Utica," says lieutenant Hall, speaking of the country south of Lake Ontario, "commences that succession of flourishing villages and settlements which renders this tract of country the astonishment of travellers. That so large a portion of the soil should, on an average period of less than twenty years, be cleared, brought into cultivation, and have a large population settled on it, is in itself sufficiently surprising; but this feeling is increased when we consider the character of elegant opulence with which it every where smiles on the eye. Every village teems like a hive with activity and enjoyment: the houses, taken generally, are on a large scale, for (excepting the few primitive log huts still surviving) there is scarcely one below the appearance of an opulent London tradesman's country box; nor is the style

of building very unlike these, being generally of wood, painted white, with green doors and shutters, and porches or verandas in front."^b "In passing through the United States," says another observer, who went over the same tract, "the traveller is particularly struck with the elegance and magnitude of the villages; and often feels inclined to ask where the labouring classes reside, as not a vestige of the meanness and penury that generally characterises their inhabitants is to be discovered. One would almost suppose Canandaigua and Geneva to have been built as places of summer resort for persons of fortune and fashion; since so much taste, elegance, comfort, and neatness, are displayed in the design, appearance, and arrangement of the houses which compose them."^c

New-York, the principal town in the state, is the greatest commercial emporium in the new world, and is perhaps second only to London in the magnitude of its trade. It is finely situated at the south end of Manhattan Island, at the head of a beautiful bay, nine miles long, and has an admirable harbour of unlimited extent, and capable of admitting vessels of any size close to the quays. The city extends about three miles along the harbour, and four miles along East River, and its progress has been so rapid that its population, which was only 33,131 in 1790, amounted to 123,706 in 1820.^d It is less regular in its plan than Philadelphia, but its situation is more picturesque and commanding. The houses are mostly of brick, and many of them handsome. There are sixty places of worship, some of which are elegant. The city is adorned with several other fine buildings, the most celebrated of which is the city hall.

The Hudson, now united with Lake Erie by one canal, and with Lake Champlain by another, affords New-York advantages for inland trade far surpassing those of any other city in the United States except New-Orleans. About half the foreign commodities used in the United States are imported here, and the export in 1820 amounted to 13,162,000 dollars, (2,800,000*l.*) of which 7,898,000 was domestic produce. There were nine or ten daily newspapers published in the city in 1822.

According to returns made in 1821, 10,039,804 yards of cloth, of cotton, woollen, or linen, were made in the state that year. There were, at the same period, 184 cotton and woollen manufactories, 172 trip hammers, and 4304 saw-mills. The tonnage belonging to the state in 1821 was 244,338 tons. The population in the interval between 1790 and 1820 increased from 340,120 to 1,372,812,^e—a rate of increase not paralleled in any other of the old states. Among the public improvements in the state, it would be unpardonable not to mention the grand canal which connects Lake Erie with the Hudson. It commences in the neighbourhood of Albany,^f follows the course of the Mohawk river, and thence proceeding in a line parallel to the southern shores of Lake Ontario, it joins Lake Erie at Buffaloe. It is 362 miles^g long, 40 feet wide at top, 28 at bottom, and 4 deep, and has an aggregate rise and fall of 654 feet, which is effected by 81 locks. It was begun in 1817, will be finished in 1824,^h and cost about five millions of dollars. The canal is the property of the state, which advanced the funds for its execution,

^a Oneida Lake extends in an east and west direction.—P.

and must be admitted to be a noble monument of the opulence and public spirit of so small a community.

It is impossible to praise in adequate terms the enlightened zeal which this state has shown in promoting education. According to a report made to the legislature in March, 1824, there were in the state, in 1823, no less than 7382 common schools, at which were educated 400,534 young persons, being 27,000 more than the whole number of children between the ages of five and fifteen, and actually exceeding one-fourth of the entire population. In no other country in the world, as the reporter observes, is the proportion of persons attending the schools nearly so large. There are besides, 40 academies, and five colleges, which receive altogether about a million of dollars annually. The prevailing religious sects are the Presbyterians, Baptists, Episcopalians, Methodists, Dutch Reformed, German Lutherans, Quakers, &c. all of which support their own preachers without receiving any assistance from the state. The constitution, as amended in 1821, vests the legislative power in a Senate and House of Representatives, elected, the former for four years, the latter for one, by all the free citizens paying state taxes. This constitution is remarkable as containing (we believe) the first concession of political rights to the free blacks, who are here allowed to vote at elections if they have been citizens three years, and possess a clear freehold of 250 dollars.^a

New-Jersey lies between Pennsylvania and New-York, and occupies an area of 6900 square miles. The soil is generally sandy and poor towards the coast, and hilly in the interior. It has very little commerce, but a considerable proportion of manufactures, particularly of iron, cotton, and leather. The state is rather deficient in common schools, but has a college at Princeton which enjoys a considerable reputation. The population was 184,139 in 1790, and 277,575 in 1820. The Presbyterians are the most numerous denomination.

Pennsylvania.—The name of Penn gave an early celebrity to the republic of *Pennsylvania*. This benevolent individual, who received his grant from Charles the Second, in 1681, carried out a great number of Quakers with him, from England, united them into a political society by a contract or constitution, and founded Philadelphia, which became the capital of the state. For the first time the peculiar principles of this sect were rendered practically operative in the concerns of government, and furnished the philosophers of Europe with a fine theme for speculation. Penn and his followers, unlike most of the other colonists, were guided by strict justice and good faith, in their transactions with the Indians. In all their public proceedings there was seen that singular plainness of speech, and patriarchal simplicity, which characterize the Quakers; private differences were adjusted by arbitrators instead of judges: and, under the protection of the mother country, the Pennsylvanians were enabled to exhibit the remarkable spectacle of a political community subsisting without the smallest trace of military force; for the Quakers acted rigidly on the principle of not carrying arms, and for a long number of years there was not even a militia in the state.^b As the numbers and business of the colonists increased, however, and as the adherents of other sects multiplied, this primitive simplicity gradually disap-

peared; but modern travellers still observe traces of its existence, in the sobriety, decorum, and orderly habits of the Philadelphians, and in the general moderation of the Pennsylvanians in the political affairs of the federal body, though there has been no want of jealousies and bickerings among themselves. Of 500 congregations in the state, in 1816, only 97, or about one fifth, belonged to the Quakers. There were, at the same period, 86 congregations of Presbyterians, 94 of German Calvinists, 74 of German Lutherans, 60 of Baptists, 26 of Episcopalians, and a few of other sects. According to Dr. Morse, about one half of the inhabitants are of English or New-England origin, one fourth German, one eighth Irish, and the remainder Scotch, Welch, Swedes, and Dutch.

Philadelphia is situated at the narrowest part of the isthmus between the Delaware and Schuylkill rivers, five miles above the point of confluence, and 100 miles from the ocean. Its port is excellent, though liable to the inconvenience of being shut for a few weeks annually by the ice. Large merchant ships can ascend to it by the Schuylkill, and ships of the line by the Delaware. It is the most regularly built large town in the United States. Its principal streets are 100 feet wide, and the others not less than 50: they are shaded with poplars, tolerably paved, well lighted at night, and kept remarkably clean. The houses are of brick, and generally of three stories. There are many handsome buildings in the city, and two which are much admired, the United States Bank, and the Pennsylvania Bank. Philadelphia is distinguished by a greater number of philanthropic, literary, and useful institutions, than any other city in the United States. Its population in 1820 was 114,410.

The Philadelphia prison is a more interesting object to humanity than the most gorgeous palaces: it presents the practical application of principles which worldly men have derided, and philosophy has upheld without daring to hope for their adoption. The exterior of the building is simple, with rather the air of an hospital than a gaol. "On entering the court," says an intelligent traveller, "I found it full of stone-cutters, employed in sawing and preparing large blocks of stone and marble; smiths forges were at work on one side of it, and the whole court is surrounded by a gallery and double tier of work-shops, in which were brush-makers, tailors, shoemakers, weavers, all at their several occupations, labouring not only to defray to the public the expenses of their confinement, but to provide the means of their own honest subsistence for the future. I passed through the shops, and paused a moment in the gallery to look down on the scene below: it had none of the usual features of a prison-house, neither the hardened profligacy which scoffs down its own sense of guilt, nor the hollow-eyed sorrow which wastes in a living death of unavailing expiation; there was neither the clank of chains, nor yell of execration, but a hard-working body of men, who though separated by justice from society, were not supposed to have lost the distinctive attributes of human nature: they were treated as rational beings operated upon by rational motives, and repaying this treatment by improved habits, by industry, and by submission. They had been profligate, they were sober and decent in behaviour; they had been idle, they were actively and usefully employed; they had

^a This concession is not peculiar to the constitutions of New-York. It is granted, without restriction, in the constitutions of Maine, New-Hampshire, Vermont, Massachusetts, New-Jersey, and Pennsylvania. —P.

From the "Illustrated London News"

PHILIPPINE ISLANDS.

disobeyed the laws, they submitted (armed as they were with all kinds of utensils) to the government of a single turnkey, and the barrier of a single grating. The miracle which worked all this was humanity, addressing their self-love through their reason. I envied America this system: I felt a pang that my own country had neither the glory to have invented, nor the emulation to have adopted it."^a

When the principles of the new system of prison discipline were first recommended by Dr. Rush, in 1787, they were considered as the schemes of a humane heart misled by a wild and visionary imagination, such as it was impossible, from the nature of man, ever to realise. The trial was made, however, after much opposition, in 1759. The eventual success of the system has vanquished the prejudices of the great majority of its enemies, and the prison of Philadelphia is become a model for those of the other states. According to the regulations, the criminal, on coming into gaol, is bathed, and clothed in the prison dress, and care is afterwards taken to make him keep his person clean. The prisoners sleep on the floor in a blanket, about thirty in one room, with a lamp always burning, so that the keeper has always a view of the apartment. They take their meals with strict regularity, by the sound of a bell, and in silence. Their food consists of bread, beef, (in small quantity,) molasses, potatoes, mush, and rice. Spirits and beer are never allowed to enter the prison walls. There is a sick-room, but from the regularity of their lives, disease is extremely rare. Work suitable to the age and capacity of the convicts is assigned them, and an account opened with each. They are charged with their board and clothes, the fine imposed by the state, and expense of prosecution, and are credited for their work. At the expiration of their time of servitude, half the amount of the sum left, if any, after deducting the charges, is paid to them. As the board is low, the labour constant, and the working hours greater than among mechanics, they easily earn more than their expenses. On several occasions the balance paid to a convict has amounted to more than 100 dollars; in one instance it was 150: and from 10 to 40 dollars are commonly paid. When, from the nature of the work at which the convict has been employed, or from his weakness, his labour does not amount to more than the charges against him, he is furnished with money to bear his expenses home to his place of residence. The price of boarding is 16 cents (about 9d.) a day. Corporal punishment is prohibited on all occasions, the keepers carrying no weapon, not even a stick; but reliance is placed for the correction of hardened criminals chiefly on the terrors of solitary confinement. The cells for this purpose are six feet by eight, and nine feet high; light is admitted by a small window, placed above the reach of the person confined. No conversation can take place but by vociferation, and as this would be heard, it would lead to a prolongation of the time of punishment. The prisoner is therefore abandoned to the gloomy severity of his own reflections. His food consists of only half a pound of bread per day. No nature has been found so stubborn as to hold out against this punishment, or to incur it a second time. Some veterans in vice have declared their preference of death by the gallows to a further continuance in that place of torment. Finally, as a security against abuses, visiting inspectors attend the prison at least twice a week, to examine into the

whole of its economy, hear the grievances, and receive the petitions of the prisoners, lay monthly reports before the Board of Control, and in every point insure the regularity of the system. As punishments are but necessary evils, and however judiciously conducted will not deliver society from crime, it is not to be expected that the best devised plan should give universal satisfaction. Accordingly, objections have been raised to this system, and its mildness has been represented as a temptation to guilt. But the best informed persons in the United States are decidedly of opinion that it has diminished crime, while it has saved expense to the state, and suffering to the criminal, and in short, that it is recommended by sound policy as much as by humanity.

Pennsylvania unites in a more equal degree than any of its associates, the agricultural and manufacturing with the commercial character. The methods of improving the breeds of cattle, the rotation of crops, the use of manures, and all the leading branches of husbandry, are said to be better understood in Pennsylvania than in any other part of the United States. Among its manufactures, those of iron, established at Pittsburg, on the western side of the Alleghanias, are considerable in amount, and progressively increasing, in consequence of local advantages of the place, which is situated in the midst of abundant mines of iron and coal, and has great facilities for the transportation of its products by the Ohio. According to the amount of its exports, (in 1820,) Pennsylvania holds the third place among the states of the Union, New-York occupying the first, and Massachusetts the second. The capital too, which is the residence of the most distinguished artists, scientific characters, and men of letters in the United States, prints and circulates a greater number of books, journals, maps, and engravings, than any other city in America. Its medical institution enjoys a high reputation, and bids fair in a short time to rival the best medical schools in Europe. The state is but indifferently supplied with common schools, and the people, especially those of German and Swedish origin, are not so well educated as the New-Englanders. The legislative power is vested in a Senate and House of Representatives, elected by the whole male population of full age. The population of Pennsylvania in 1820 was 1,049,458. Area, 43,950 square miles.

What holds true of the state of manners in this state, may be applied to those of the middle states generally, and may be taken as descriptive of the best society in America. In New-York and Pennsylvania, the people generally are perhaps less intelligent than in Massachusetts, but at the same time less pertinacious and intolerant. Though persons in genteel circumstances abound in Philadelphia, society has not yet attained those graces and that refinement which are to be found among the highest classes in Europe. "By society," says a traveller already quoted, "I mean the art of combining social qualities so as to produce the highest degree of rational enjoyment; this supposes a common stock of ideas on subjects generally interesting, and a manner of giving them circulation, by which the self-love of each may be at once roused and satisfied. Public amusements, the arts, and such literary and philosophical topics, as require taste and sensibility, without a fatiguing depth of erudition, a morality rather graceful than austere, and a total absence of dogmatism on all subjects, constitute many of the materials for such an intercourse. In Philadelphia public amusements are nothing; the fine arts

^a Hall's Travels in Canada and the United States, p. 302.

are little considered, because every man is sufficiently occupied with his own business. For the same reason, questions of mere speculation in literature or philosophy would be looked upon as a waste of time; in morality every thing is precise; in religion all is dogma. It may seem strange that a people so generally well informed as the Americans, should be so little sensible to literary enjoyments; not less curious is it, that the freest people upon earth should be straight-laced in morality, and dogmatical in religion. A moment's consideration will solve this seeming inconsistency. The Americans read for improvement, and to make a practical application of their knowledge: they collect honey for the hive, not to lavish its sweetness in social intercourse; hence the form is less considered than the matter; but it is the form which is principally the subject of taste. Again, piquaney in conversation supposes a certain persiflage, a latitude in opinion, which allows every thing to be said on every subject, provided it is said well. This kind of freedom, which appertains perhaps to a corruption of existing institutions, is singularly inapplicable to a country in which all moral duties are positive; and whatever is positive admits neither of speculation nor discussion. The American, silent and reflecting, occupies himself very little with the effect of what he says. "*Briller dans la societe,*" is to him an unmeaning phrase; his politeness is no reflexion of his feelings, but an artificial form he has borrowed to hide a vacuum: and what should have induced a sensible people to borrow a tramping so unsuited to their character? the vanity, probably, to rival the nations of Europe in manners as well as in arts and power. Accomplishments among females are in the same predicament with politeness among the males; they are cultivated upon a principle of vanity to imitate the ladies of Europe; but they seldom enrich the understanding, or give elegance to the manners."^a This applies however to the wealthier classes. It should not be forgotten that the great body of the people are superior to those of any European country in every thing relating either to morals or conduct. Their situation denies them refinement; but they never betray that clownish and downcast air which marks the degraded condition of the peasantry of the old world. They are better informed, and more active in their habits, as well as more independent in their circumstances; they have that reliance on themselves which gives to their manners the charm of being unconstrained and natural, and that manliness of character and self respect which elevates them above mean practices and degrading vices. An American artisan or labourer does not feel that rank, office, or wealth, is necessary to entitle him to open his lips. He never forgets that he is a man, that those around him are nothing more.

Delaware is the least populous state in the Union, and the smallest in extent except Rhode Island. Its soil is but moderately fertile; it has little shipping; but its manufactures are considerable. Area, 2060 square miles. Population, 72,749 in 1820.

In our progress southward, *Maryland* is the first state in which slavery exists to any considerable extent, for in New-York, New-Jersey, and Delaware, the slaves are few in number, and constantly decreasing. It is here also that the system of husbandry peculiar to the southern states begins. The staple of Maryland is tobacco, a plant to which the farmers of the states farther north are almost

strangers, and which is here cultivated by the labour of slaves. The negroes work in sets; the seed is sown in beds of fine mould, and transplanted in the beginning of May. The plants are set at the distance of three or four feet from each other, and are tilled and kept continually free from weeds. When as many leaves have shot out as the soil will nourish to advantage, the top of the plant is broken off to prevent its growing higher. It is carefully kept clear of worms, and the suckers which put up between the leaves, are taken off at proper times, till the plant arrives at perfection, which is in August. When the leaves turn of a brownish colour, and begin to be spotted, the plant is cut down, and hung up to dry, after having sweated in heaps over night. When it can be handled without crumbling, the leaves are stripped from the stalk, tied in bundles, and packed for exportation, in bogsheads containing 800 or 900 pounds. No suckers or ground leaves are allowed to be merchantable. About 6000 plants yield 1000 pounds of tobacco.

Maryland, considering its extent and population, ranks high as a commercial state. Its commercial capital, Baltimore, has had a more rapid growth than any town in the United States, or perhaps in the world. In 1750 it consisted of half a dozen of houses built round the head of the bay; in 1790 its population was 13,503, and in 1820, 62,738. It has an excellent harbour, and a greater amount of shipping than any port in the United States, except New-York and Boston. Its merchants are distinguished by hospitality, polished manners, an extraordinary spirit of enterprise, and a strong attachment to republican principles. Maryland was first settled by a colony of Catholics in 1634, who had the credit of establishing a full religious toleration at an early period. It still contains a greater number of persons of this denomination than all the other states put together. Annapolis, the seat of the government, contains 2260 inhabitants. The population of the state in 1820 was 407,350, including 107,398 slaves. Area, 10,800 square miles.

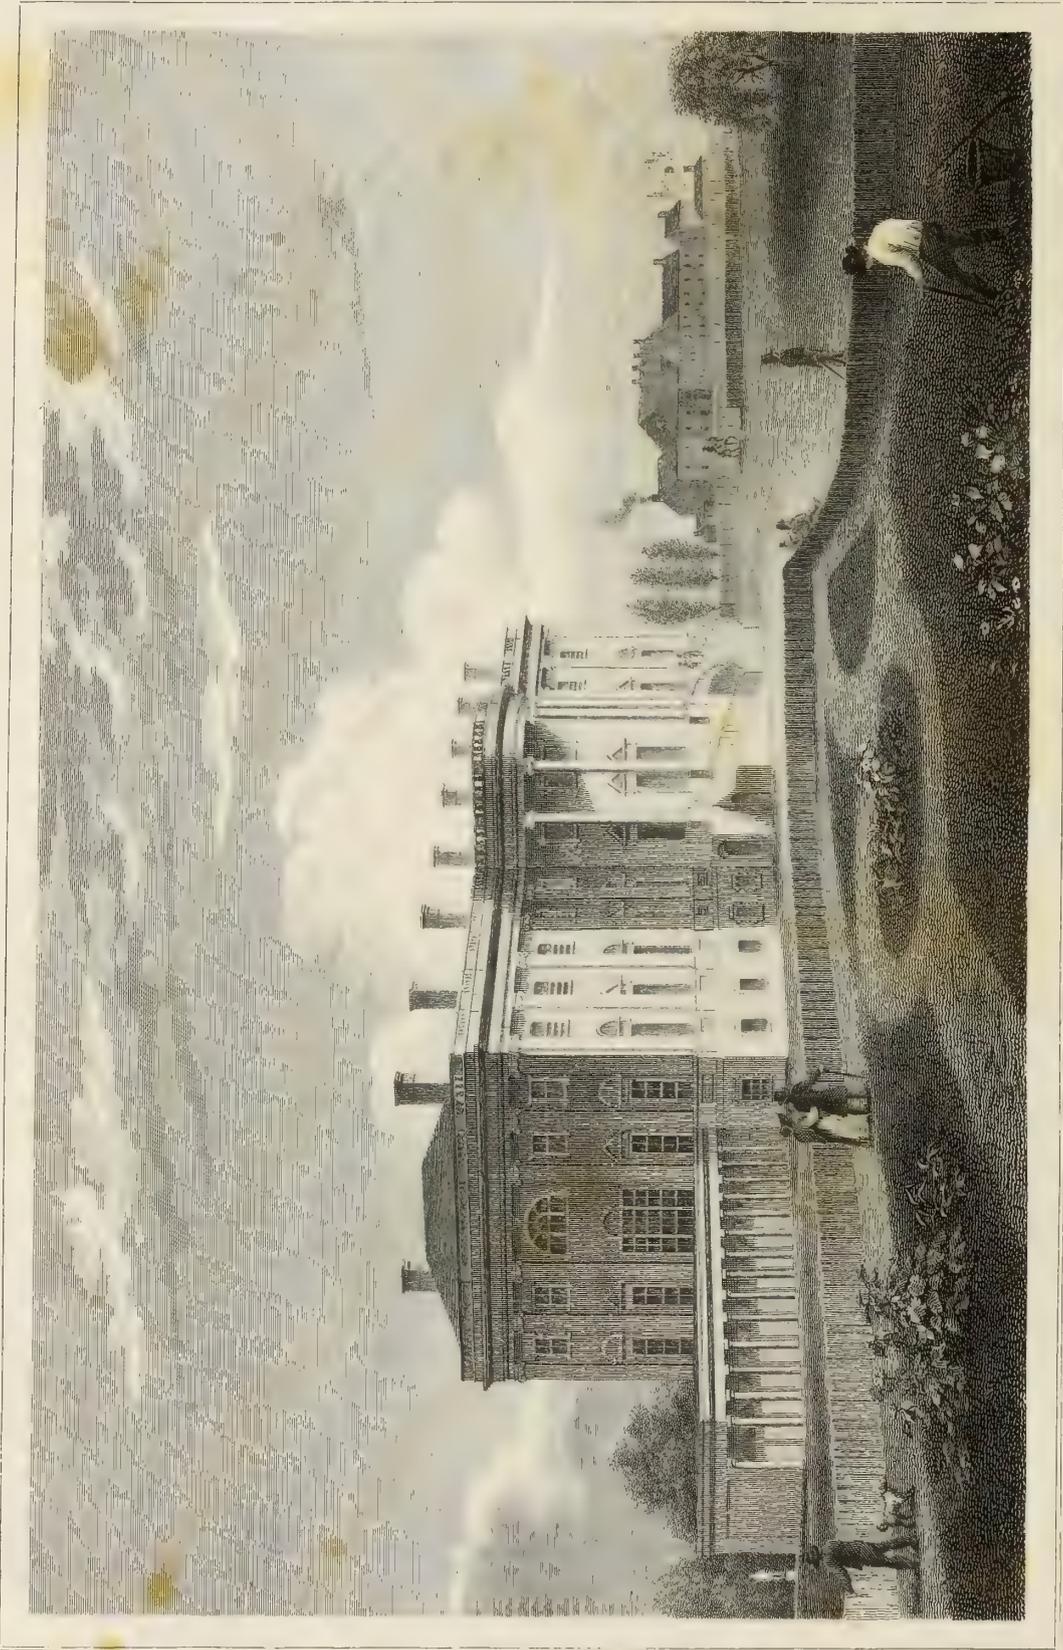

Virginia, the first in order, and the most powerful and populous of the southern states, includes a surface larger than that of England, and greatly diversified in soil and climate. The eastern coast is poor and sandy, and rather unhealthy; the valleys between the ridges of the Alleghanies are fertile and salubrious, and inhabited by an uncommonly tall and vigorous race of men. West of the mountains the climate is temperate and agreeable. The upper country raises excellent wheat; tobacco is extensively cultivated between tidewater and the mountains; and rice, with some cotton, grows near the coast. The first civilized settlement made in the United States, was on James River, in this state, in 1607. The adventurers, who increased from year to year, were reduced, in consequence of the scarcity of females, to import wives by order, as they imported merchandise. It is recorded that ninety girls, "young and uncorrupt," came to the Virginia market in 1620, and sixty in 1621, all of whom found a ready sale. The price of each, at first, was 100 pounds of tobacco, but afterwards rose to 150.^b What the prime cost was in England is not stated.

The illustrious Washington, the brightest model of a patriot in ancient or modern times, was a native of Virginia, which boasts of giving four Presidents to the United States out of five who have held office since the present

^a Hall's Travels, page 290.

^b Morse, I. 470.

THE PRESIDENTIAL MANSION, WASHINGTON.

BALTIMORE,

constitution was established. Washington was born in 1732, appointed Commander in Chief in 1775, elected President in 1789; he retired from that office in 1797, and died in 1799.

Virginia is but indifferently supplied with the means of education; but in 1811 the legislature set apart a sum, which has been increased by subsequent grants to a million of dollars, for founding schools, academies, and a university. If the latter is established on the large and comprehensive plan projected, it will be one of the most perfect institutions of the kind. Virginia is deficient in churches, but religion is making progress. The most considerable sects are the Baptists and Methodists. The Presbyterians, Episcopalians, and Friends, are next in numbers. The Virginians are firm republicans, polite, frank, hospitable, generous, and high-spirited; but they are accused of pride, indolence, irascibility, and other bad qualities, nourished by the existence of slavery. Estimating by the amount of its exports, in 1820, Virginia holds only the eighth rank among the commercial states. The exports consist chiefly of tobacco, flour, Indian corn, pork, lumber, coals. Its manufactures are chiefly domestic, except those of iron, lead, and small arms, which are on a considerable scale. Richmond, the chief town, is beautifully situated at the falls of James River, and contained 12,067 inhabitants in 1820. The population of the state in 1790 was 747,610, and in 1820, 1,065,366, the latter number including 425,153 slaves. Area, 64,000 square miles.

Between Maryland and Virginia lies the Federal District of *Columbia*, comprehending a space of ten miles square, which forms the seat of the federal government, and is placed under its exclusive authority. Nearly in the centre of this district, on an angle formed by the Potomac and another stream, is the city of Washington, the nominal capital of the United States. It is laid out on a regular plan, with a reference to the inequalities of the ground, so that the public edifices, and the large squares and areas, generally occupy sites which command extensive prospects. Ships of burden can come up to the town; and by the Potomac and Shenandoah the city communicates with an extensive and fertile back country. Notwithstanding these advantages, the slow growth of Washington has disappointed the Americans much. The population of the Federal City in 1820 was only 13,247, and that of the District, including Georgetown and Alexandria, 33,039, of whom 6,377 were slaves, and 4,048 free persons of colour. The Capitol is not yet completed, but is allowed to be a very fine building. It contains chambers for the Senate and House of Representatives, apartments for the Supreme Court of the United States, the national library, &c. The President's house is a handsome building, furnished at the public expense, and especially appropriated for the residence of the Chief Magistrate.

North Carolina resembles Virginia in climate, soil, and the character of its population. The alluvial tract along the coast is low, sandy, and barren, abounding in swamps, which produce cedars. The coast is covered by a line of sand banks, which render access to the bays and rivers extremely difficult, and are the cause of numerous shipwrecks. The potato is indigenous in this state, and is supposed to have been conveyed from hence to Ireland in 1587 or 1588.^a The North Carolinians are mostly plant-

ers, and live from half a mile to three or four miles from each other on their plantations. In the upper country, they are farmers. There is no general provision for the support of schools in this state, but education as well as morals and religion has been making progress since the late war. The legislative power is vested in a Senate elected by the landholders,^b and a House of Commons elected by all that pay taxes. The Methodists, Baptists, and Presbyterians, are the predominant sects. This state has few manufactures except of the domestic kind; and its commerce is chiefly with the other states. Population in 1790, 393,751, and in 1820, 638,829. Area, 43,300 square miles.

South Carolina exhibits the character peculiar to the slave states, perhaps in a higher degree than any other section of the Union. The planters are the most opulent of their class, and it is only in this state that the slaves exceed the free inhabitants in number. To the distance of about a hundred miles from the sea, the country is low, flat, sandy, and unhealthy. The rivers here are bordered with marshes, in which are produced large crops of rice. Above this, and reaching to the foot of the mountains, is a fertile country, beautifully diversified with hill and dale, and richly wooded. In addition to many of the fruits of the northern states, South Carolina produces oranges, limes, lemons, figs, and pomegranates. The low country is universally occupied by planters, who cultivate the ground by slaves; in the upper country the population consists chiefly of farmers, who work with their own hands. Cotton, the great staple of the state, is of three varieties. The *black seed* cotton is grown on the sea islands, and in the low country: it produces a fine white fleece, of a silky appearance, very strong, and of a long good staple. *Green seed*, or upland cotton, chiefly cultivated in the middle and upper country, produces a white fleece, good, but of shorter staple, and inferior to the other. It adheres so closely to the seed, that, till the invention of the cotton gin, by Mr. Whitney, it was not worth cleaning. That invention has been of incalculable benefit to the southern states. The *Nankeen* cotton, raised chiefly in the middle and upper country for family use, retains the Nankeen colour as long as it is worn. The cultivation of rice is necessarily limited to lands that admit of irrigation—to swamps on bays, creeks, and rivers overflowed by the tide, and to inland swamps with reservoirs of water. Inland plantations yield from 600 to 1500 pounds of clean rice per acre; tide plantations from 1200 to 1500, and the best as high as 2400 per acre. Rice is sown in the tide lands about 20th March, and in the inland swamps about the second week of April. The land is previously turned up with the plough or hoe, and then drilled by the same instrument into trenches. In these the rice is sown from one to two bushels per acre. The tide planters then flow the fields with water, keeping it on from two to four days. This kills the worm and starts the grain, which appears five or six days afterwards. It is commonly hoed thrice during its growth, and in the second hoeing the grass is picked up by the hand from the trenches, and the rice is then overflowed from ten to twenty days. As the water is gradually drawn off, the plants branch, and on the number of branches depends the size of the crop, each branch producing one ear of from 100 to 300 grains. Three months after sowing it begins to joint, blossom, and form

^a Morse, I. 502.

^b With a freehold of 50 acres, and one year's residence.

the ear. It is then overflowed till harvest, which commences in the end of August near the sea, and in September is general through the state. The rice grounds, thus alternately wet and dry, infect the air with noxious exhalations, and spread bilious and intermitting fevers among the negroes who labour them, and the white settlers who live in their vicinity. A single plantation has often rendered a considerable town unhealthy. Rice was introduced into Carolina from Madagascar only in 1693.

The Carolinians, says Dr. Ramsay, combine the love of liberty, hospitality, charity, and a sense of honour, with dissipation, indolence, and a disposition to contract debts. Hunting and dancing are favourite diversions, and music is cultivated with much diligence and success. The planters, who form the leading class, and have large incomes, live at their ease, are high minded, and possess much of that dignity of character which belongs to our independent country gentlemen. The farmers, who have few or no slaves, are active, industrious, and more simple in their manners. The women are generally well educated, and many of them possess refined manners, and cultivated minds. Their natural vivacity is tempered by sweetness of disposition and discretion. They are affectionate wives, daughters, and mothers; they enjoy prosperity without ostentation, and bear adversity with patience and dignity. "Indolence, ignorance, and dissipation," in the opinion of Mr. Hall, "are leading traits in the character of the planters of the southern states." The manners of the lower classes are depraved and brutal; those of the upper, corrupted by power, are frequently arrogant and assuming. Unused to restraint or contradiction of any kind, they are necessarily quarrelsome; and in their quarrels the native ferocity of their hearts breaks out. Duelling is not only in general vogue and fashion, but it is practised with circumstances of peculiar vindictiveness. "It is usual when two persons have agreed to fight, for each to go out regularly and practise at a mark, in the presence of their friends, during the interval which precedes their meeting: one of the parties therefore commonly falls." It may be added, that the roads, bridges, inns, and public conveyances, are worse in the southern than in the northern states; agriculture and the mechanic arts are in a more backward state; education and knowledge are less generally diffused, and the press is much less active; there is less inland trade, and less shipping in proportion to the population; less, in short, of intellectual activity, and of the spirit of enterprise and improvement.

The exports of South Carolina exceed those of any one of the southern states, except Louisiana, which is properly the outlet of the whole western country. Cotton and rice are the leading articles, after which may be classed timber, pitch, tar, turpentine, beef, pork, indigo, and tobacco. Charleston, the principal town, contained 24,780 inhabitants in 1820; it is the most considerable port for trade between Baltimore and New-Orleans. The population of South Carolina in 1790 was 240,073, including 107,094 slaves. In 1820 it was 502,741, including 258,475 slaves; so that the number of the latter has increased faster than that of the freemen. Area, 30,080 square miles.

As there is a great uniformity both in the physical circumstances of the southern states, and the character of the population, it will not be necessary to speak of the others much in detail. *Georgia*, like the state last described, consists of two tracts of land, an alluvial plain towards the

coast, covered with sands, intermixed with swamps; and a rolling upland country of good soil towards the mountains. The produce and exports are similar to those of South Carolina, and it has few manufactures, except of the domestic kind. The first settlement in this state was formed in 1733, by colonists from Britain, who were sent out with a grant of money by parliament. The population of Georgia in 1790, was 82,548, and in 1820, it had increased to 340,989, of whom 149,656 were slaves. Area, 58,200 square miles.

Alabama was raised to the rank of a state only in 1819. In soil, climate, and productions, it resembles South Carolina and Georgia; but it should be mentioned that, in the latter state, as well as in Alabama, the sugar cane is now cultivated to some extent. Cotton is the staple. This state has wisely made provision, in laying out the public lands, for the support of schools. Population in 1820, 127,901, of whom 41,879 were slaves.^a Area, 50,800 square miles.

Mississippi was received into the Union, as an independent state, in 1817. The soil, produce, and climate, are similar to those of the preceding states. Cotton is the staple, and sugar is cultivated to some extent. The population was 75,448 in 1820, exclusive of Indians, of whom there are a great number in the state. Area, 43,350 square miles.

Louisiana was the name originally given to the vast country west of the River Mississippi; but it is now restricted to a district at the mouth of this river, extending from the Mexican Gulf to the thirty-third parallel, and which was erected into a state in 1811. The southern section of this state includes the Delta of the Mississippi. The country about the mouths of the river for thirty miles is one continued swamp, destitute of trees, and covered with a species of coarse reed four or five feet high. Nothing can be more dreary than the prospect from a ship's mast, while passing the immense waste. The Mississippi flows upon a raised ridge or platform, its two banks forming long mounds which are elevated many feet above the general level of the country. Its waters are lowest in October, and during the height of the inundation in June, they flow over the lower parts of the banks, and cover the adjacent country. From lat. 32° to 31°, the breadth of the overflowed lands is about twenty miles; from 31° to 30°, it is about forty miles. Below 30°, the waters often cover the whole country. The whole extent of lands over which the inundation reaches on the Mississippi and Red River, is estimated at 10,890 square miles; but within this surface there are many tracts which are never covered. The best lands consist of the immediate banks of the river, which are from a mile to a mile and a half broad, and are seldom or never overflowed. They are extremely rich, and sell by the front acre, the depth of each tract being forty, and sometimes eighty acres; but only the twenty acres nearest the river are dry enough to be susceptible of cultivation. To protect this ground from inundation, a *levée*, or artificial embankment of earth, from five feet to thirty in height is raised upon the natural bank of the river, at the distance of thirty or forty yards back from the usual margin of the water. Each proprietor is bound to keep up the *levée* in front of his own land, and on some plantations one sixth of the annual labour is employed in repairing these works.

^a The census of Alabama was not completed till 1822, when it was found to be 144,317. Population, in 1824, 197,000.

The water sometimes bursts these artificial barriers, and rushes out with a noise like the roaring of a cataract, boiling and foaming and tearing every thing before it. When a breach of this kind is made, which is called a *crevasse*, the inhabitants, for miles above and below, abandon every employment, and hasten to the spot, where every exertion is made, night and day, to re-establish the levée; but more frequently the destructive element is suffered to take its course. The consequences are, that the flood overthrows the buildings, and sweeps away the crop, and often the soil, leaving the surface strewn with numerous logs and trees, which must be destroyed before the land can be again cultivated.

The staple productions of Louisiana are cotton, sugar, and rice. The cotton plantations are the most extensive, but those of sugar are rapidly increasing in the southern parts of the state. There is a vast extent of lands adapted to the cultivation of rice. The manufactures of the state are extremely inconsiderable. Its commerce is great, and is daily augmenting. The inhabitants are a mixed race, composed of French, Spaniards, Americans, Canadians, Germans, Africans, and their descendants. The planters live in a splendid and luxurious style; the farmers enjoy a rough abundance, are brave and hospitable, but unpolished. The majority of the inhabitants are Roman Catholics, and, till 1812, there was no Protestant Church in the state. Dancing, gambling, and theatrical amusements, were common after the morning mass on Sundays. Laudable efforts have of late been made to increase the means of education, which have hitherto been deplorably neglected. Of the French inhabitants, not one in ten can read. New-Orleans, the chief town, is situated on the left bank of the Mississippi, 105 miles from its mouth by the course of the river. The French language is used here to a considerable extent, but the English now predominates. Of five newspapers, three are printed in English, and two in both languages. In the legislature, which consists of two houses, elected by all the male population of full age, the French and English parties were pretty equally balanced in 1818, the former having the majority in the House of Representatives, and the latter in the Senate. New-Orleans had about 10,000 inhabitants in 1800, and 27,176 in 1820. It is very unhealthy during four months of the year, but enjoys an excellent situation for trade, being the natural entrepot for the whole basin of the Mississippi, the largest and richest valley in the world. The introduction of steam boats, of which there were 74 on the Mississippi in 1823, has greatly facilitated its communication with Ohio, Illinois, Kentucky, and Missouri, whence it receives vast quantities of raw produce and lumber. The exports of the state in 1820 amounted to 7,382,000 dollars. The population in the same year was 153,407, of whom 69,064 were slaves. Area, 48,000 square miles.

Tennessee is one of the most pleasant, healthful, and beautiful states in the Union. It is free of the barren, sandy tracts, and great swamps, so common in the states of the south, and enjoys a richer soil and better climate than those of the north. Its surface is partly undulating, and partly mountainous. The blighting north-easterly winds are never felt here, and those of the north-west very rarely. Vegetation commences about six weeks earlier than in New-Hampshire, and continues six weeks later. The state is watered by two noble rivers, the Cumberland and

the Tennessee, which are scarcely ever frozen, and afford a great extent of boat navigation. Cotton, tobacco, wheat, hemp, and maize, are the leading articles of raw produce. Its manufactures are chiefly domestic, except those of iron and nitre. Numerous vestiges of ancient dwellings, towns, and fortifications, with mounds, barrows, utensils, and images, are found in this state, wherever the soil is of prime quality, and well situated for water. The venerable forests which now flourish over the spots where these relics are found, demonstrate that the people to whom they owe their origin, had evacuated the country at least five hundred, and more probably a thousand years ago. The population of Tennessee, in 1790, was 35,691, and in 1820 it was 422,813, of whom 72,157 were slaves. Area, 41,300 square miles.

Kentucky is similar in soil and climate to Tennessee, but is rather less mountainous, and has perhaps a greater proportion of fertile, arable land. The Ohio forms its northern boundary, and affords it an easy communication with the sea. The greatest natural disadvantage of this state is the failure of most of the streams during the summer. Kentucky was first explored about 1750, and the first settlement was made in 1773. Its chief agricultural productions are wheat, tobacco, Indian corn, hemp, rye, and, to a small extent, cotton. Vineyards have been found to succeed. Since the late war its manufactures have increased greatly. The people, who consist of emigrants from every state in the Union, and almost every country of Europe, are brave, frank, and hospitable; but they are said to be too much addicted to drinking and gambling, and to show a ferocious and revengeful spirit in their quarrels. The state of education is rather backward, and that of religion not much better. The most numerous denominations are the Baptists, Presbyterians, and Methodists. The Kentuckians, possessing a sanguine, speculative spirit, were deeply infested with the passion for banking, which spread like an epidemic frenzy through the United States some years ago. No less than fifty-four banks were incorporated between 1807 and 1819, in a district containing only half a million of inhabitants. These establishments, after inundating the state with fictitious paper currency, became nearly all insolvent, and produced incalculable distress and confusion in the country.*

There are many ruins of ancient works spread over this state, which prove that at some distant period it was thickly inhabited by a warlike people, superior to the existing Indians in arts and knowledge, who had either migrated to the south or been destroyed. One of these works consists of an ancient fortification near the banks of the Ohio, embracing fourteen acres, and extremely well preserved. The walls in some places are from eight to sixteen feet high, thirty feet wide at bottom, and on the top broad enough for a loaded wagon to pass. Two parallel walls of the same dimensions, and 280 yards long, project westward from one angle, and form a covered way communicating with a rivulet. Other two covered ways of the same kind communicate with streams on the other sides. The construction of the fort shows that it must have been built by men accustomed to labour, possessing considerable science in the business of fortifications, and who probably had iron tools. As the ground is now covered with

* See Flint's Letters from America, No. 16.

the second or third growth of wood, it is plain that the work must belong to a pretty ancient period. A greater quantity of the remains of the mammoth have been discovered in Bigbone valley in this state, than in any other part of North America. The population of Kentucky in 1790 was 73,677, and in 1820 it was 564,317, including 126,732 slaves. Area, 39,000 square miles.

About one fourth of the state of *Ohio* declines to the northern lakes; the other three fourths to the Ohio. The surface of the former is generally flat, and frequently marshy; that of the latter is rolling and uneven, and beautifully diversified with round topped hills, covered with a fertile soil, which bears a rich growth of wood. The country is at the same time watered by many fine streams navigable for boats; it is blessed with an excellent climate; and as slavery does not exert its demoralizing influence here upon society, the state presents greater advantages to agricultural settlers than any other in the western territories. It has accordingly advanced with remarkable rapidity, and already outstrips Kentucky in population, though it was not settled so early by twelve or fifteen years. The average produce of farming land in this state, and in the basin of the Ohio generally, is forty bushels of maize per acre, twenty-two of wheat, twenty-six of rye, thirty-five of oats, thirty of barley, and twelve to fifteen hundred weight of tobacco.* The latter is cultivated only to a limited extent in Ohio for domestic use. The south-east parts of this state possess an unlimited supply of pit coal, which will facilitate the growth of manufactures. Those hitherto established are chiefly domestic. *Prairies*, or large tracts of ground naturally destitute of wood, abound here, and in all the country west of the Alleghanies. In the northern parts of this state, and of Indiana and Illinois, they occupy three fourths of the surface. The Ohio and its larger tributaries are navigable for boats all the year, except from the beginning of December to the middle of February, when the passage is obstructed by ice. During the height of the swell from March to June, large vessels ascend as far as Marietta, and even Pittsburg. Many mounds, embankments, and other monuments of an ancient population, are found in this state as well as Kentucky; but, like the others, they are merely of earth, and not a single column, or brick, or hewn stone, has been discovered. Cincinnati, situated at the south-west angle of this state, is the largest town west of the Alleghanies; it contained 9642 inhabitants in 1820. In this state, and in Indiana and Illinois, one section in each township, or one thirty-sixth part of the whole lands, is set apart for the encouragement of education. The inhabitants are generally an industrious, moral, and orderly people, with much intelligence and enterprise. The prevailing religious sects are Presbyterians, Methodists, and Baptists. The legislative power is vested in a senate chosen biennially, and a house of representatives chosen annually by all the males of full age. The population in 1790 was estimated at no more than 3000, and in 1820 it amounted to 581,434. Area, 38,500 square miles. Ohio was admitted into the Union in 1803.

Indiana resembles Ohio so closely in climate, soil, situation, and the character of its inhabitants, as to render any detailed description unnecessary. It was admitted into the

Union as an independent state in 1816. Its population in 1800 was 5641, and in 1820, 147,178. Area, 36,250 square miles.

Illinois.—For the same reason we shall speak of *Illinois* very concisely. The land of this state is similar in quality to that of the two preceding, except that its surface is generally more level, and less abundantly wooded. At Cahokia and Kaskaskias, and at Vincennes, in Indiana, settlements were formed about 150 years ago by some Frenchmen, who intermarried with the Indians, and were found almost at the same level of barbarism, when the Americans, in their progress westward, broke in upon their isolated abodes. Both Indiana and Illinois are excellent corn countries, and the mineral kingdom yields lead, iron, coal, and salt, in considerable abundance. Illinois was created an independent state in 1818. The population in 1820 was 55,211. Area, 59,000 square miles.

The state of *Missouri* lies on both sides of the river of the same name, and on the west side of the Mississippi. Its surface is uneven or hilly in the northern parts, and in the south it embraces a portion of the Ozark Mountains. It contains still less wood than Illinois, but has a fertile soil generally, and a climate equally temperate. In the south-east part of the state, there is a district 100 miles long by 40 broad, containing most productive mines of lead, of which forty-five are actually worked, and yield annually three millions of pounds of lead of excellent quality. This state, which has unhappily legalised the existence of slavery, was admitted into the Union in 1821. Its population in 1820 was 66,586, including 10,222 slaves. Area, 60,300 square miles.

To this short account of the twenty-four states which compose the federal body, and send members to the national legislature, we shall add a few words respecting those districts, called *Territories*, which are of two kinds. The one kind includes those tracts of country over which the United States claim the right of sovereignty, though inhabited only by Indians. Of these there are three, the *North-West Territory*, *Missouri Territory*, (distinct from the state of Missouri,) and the *Western Territory* on the Pacific Ocean. The other kind includes districts in which civilized settlements have commenced, but the inhabitants not having reached the number of 60,000, which entitles them to form a constitution for themselves, and to send members to Congress, they are governed by a provisional legislature, upon whose proceedings the governor, appointed by the President of the United States, has a negative. They have also the privilege of sending a delegate to Congress, who has the right of speaking, but not of voting. Except in the last mentioned circumstance, these provisional governments are formed very nearly upon the model of the old charters granted by Britain to the American colonies. There are three territories of this description—Florida, Michigan, and Arkansas.

Florida was ceded by Spain to the United States in 1821, and was a valuable acquisition, as it perfects their southern frontier, and removes a hostile power from a position which exposed them to attack. The country is low and sandy, and interspersed with swamps, but it contains some good soil, and abounds in live oak, a species of wood highly valued for ship building. A limestone ridge, elevated not more than 200 or 300 feet above the sea, divides the rivers that flow eastward from those that flow westward, and this is said to be the highest ground in the peninsula,

* James's Account of an Expedition from Pittsburgh to the Rocky Mountains, vol. iii. p. 199.

though it is 150 miles broad. The most considerable places are, St. Augustine on the east coast, which had 3000 inhabitants, and Pensacola on the west, which had 2000, both chiefly of Spanish origin. The latter is the best port in the Mexican Gulf. The population of Florida was estimated in 1820 at 10,000, exclusive of Indians, of whom there are several tribes. Area, 57,750 square miles.

Michigan forms a peninsula, surrounded on three sides by Lakes Erie, St. Clair, Huron, and Michigan. The climate is similar to that of Upper Canada, and though tempered by the proximity of a great body of water, is severe. The winter lasts from the middle of November to the middle of March. The principal productions are wheat, maize, oats, buckwheat, barley, and potatoes. Its surface is generally level, but not deficient in fertility. It seems however to present few attractions to settlers; for the number of inhabitants, which was 4762 in 1810, had only increased to 8896 in 1820. Area, 38,750 square miles.

Arkansas lies on the west side of the Mississippi, between Louisiana and Missouri. Its eastern part is flat, and contains the great swamp which receives the surplus waters of the Mississippi: the western part is uneven, but very bare of wood; the middle is occupied by the broad and low chain of the Ozark Mountains, and is said to be healthful and pleasant. This territory contained 14,273 inhabitants in 1820, of whom 1617 were slaves. Area, 121,000 square miles.

The *North West Territory* is situated between Lakes Superior and Michigan, and the Mississippi. It has a rigorous climate, a soil not unfertile, but thinly wooded, and is said to contain mines of copper, lead, and iron. It has a few white inhabitants, at one or two points, who are subject to the government of Michigan. Area, 144,000 square miles.

The *Missouri Territory* comprehends the vast region situated on both sides of that river, between the state of Missouri and the Rocky Mountains. Of this territory the part between the Missouri and Mississippi is a rolling country, including some low hills. It is chequered by stripes of woodland, which divide it into parterres, but excepting the grounds contiguous to the two rivers, nineteen twentieths of the surface are destitute of timber. The waters of the Missouri are more loaded with soil than those of the Mississippi, and hence the bottom lands of the former are richer than those of the latter. The bottoms of the Missouri are clothed with a deep and heavy growth of timber and under-brush, to the distance of 350 miles from its mouth. As we ascend beyond this, the prairies increase, until at length the wood disappears, except at some few spots. The banks of the Mississippi, above the junction, are still less wooded than those of the Missouri, and the climate towards the sources of both rivers is extremely rigorous. Indeed, after we pass the meridian of 96°, vegetation becomes less abundant and vigorous, and the sterility increases as we advance westward. The hills which form the outskirts of the Ozark mountains subside into an undulating surface of great extent, with nothing to limit the view, or vary the prospect, but here and there a hill, a knob, or insulated tract of table land. These table lands increase in number, and diminish in size, as we approach the Rocky Mountains, and exhibit a very remarkable appearance. They rise six or eight hundred feet above the common level. Their sides consist sometimes of gentle acclivities, but often of

rugged and perpendicular cliffs, which forbid all access to their summits. They are composed of secondary sandstone, alternating with breccia or puddingstone. The surface between these elevations is sometimes covered with water-worn pebbles, and gravel formed of the *debris* of granite, gneiss, and quartz rocks; but more generally we see a wide waste of sand, with patches of vegetable mould, continually diminishing in number, till the Rocky Mountains rise to our view towering abruptly from the plains, mingling their snow-clad summits with the clouds, and exposing at their feet a frightful wilderness of rocks, stones, and sand, scarcely chequered by a single trace of vegetation. In this desert solitude the Platte, Kansas, and other rivers, often spread out to a breadth of one or two miles, and in summer lose their waters almost entirely. Though tracts of good land do occur, they are rare; and the scarcity of wood and water form obstacles to settling, which even American perseverance will scarcely surmount. With some few exceptions, the tract of country extending 400 miles eastward from the Rocky Mountains, may be pronounced "unfit for cultivation, and, of course, uninhabitable by a people depending on agriculture for subsistence." It should be observed, however, that the numerous streams which traverse this district, give it a character quite distinct from that of the African deserts. At certain seasons of the year, these streams are navigable for boats almost to their sources; at other times, the vegetation which exists along their banks supplies the means of sustenance to animals; and at all times water may be found in some of them sufficient for the wants of travellers. These deserts, therefore, though scarcely habitable themselves, are not such formidable barriers to commercial intercourse between people situated on their opposite sides as those of Africa and Asia.^a

The Rocky Mountains rise abruptly on the eastern side, from a plain which is supposed to be elevated about 3000 feet above the sea. They consist of ridges and peaks, the highest of which are covered with perpetual snow, and rise from 4000 to 8000 feet above their base, or from 7000 to 11,000 feet above the sea. They are rugged and broken, and though generally rather barren, they exhibit a scattering growth of scrabby pines, oak, cedar, and furze, and inclose some fertile valleys.

The *Western Territory* includes the country watered by the Columbia and its numerous branches. The tract along the Rocky Mountains is a high level plain, in all parts very fertile, and in many covered with a growth of long-leaved pine. The rest of the country is nearly of the same description; but the soil, in the district nearest the coast, is subject to excessive rains. The climate, however, is remarkably mild, and the natural timber is fine. A fallen fir tree in the Columbia valley was found by Lewis and Clarke to be 318 feet in length, though its diameter was only three feet. The Columbia is navigable for sloops as high as the tide water reaches, 183 miles. At the mouth of the river the United States have established a colony,^b which will probably soon be connected with the settlements on the Missouri by a line of military posts. The Indian tribes, which are numerous in the Western Territory, have been supposed to include a population of 80,000 souls.^c

BOOK LXXXI

THE DESCRIPTION OF AMERICA CONTINUED

United States continued.—The Aborigines. Manners and Character of the various Tribes.

WE now leave the confines of civilization, and proceed to survey those tribes of Indians who roam over the vast region from the Alleghanies to the Pacific Ocean, in a state of savage independence, and who are evidently destined, at no distant day, to be supplanted by the continued encroachments of the whites, and probably to disappear entirely from a continent of which, three centuries ago, they held undisputed possession from sea to sea. The works of Major Pike, and of Lewis and Clarke, and of various other travellers, will be our authorities. Taking the former for our guide in the first place, we shall describe briefly the Indians of the Upper Mississippi.

The powerful nation of the Sioux is the terror of all the savage hordes, from the River Corbeau to the mouth of the Missouri. It is divided into several tribes. The *Minoa Kuntong*, or "People of the Lake," who occupy the country from the Prairie du Chien to the Prairie des Français, are subdivided into four parties, obeying four different chiefs. Of all the Sioux, they are the bravest and most civilized, and they alone make use of canoes. They build cabins with trunks of trees; but though they practise agriculture, and raise a small quantity of maize and beans, the wild oats, which grow spontaneously over nearly all the north-western parts of the continent, chiefly supply them with bread. They are generally provided with fire-arms. The *Waspingtons*, or "People of Leaves," wander in the country between the Prairie des Français and the River Saint Peter's. The *Sassitongs* hunt along the Mississippi from the River St. Peter's to the River Corbeau. The erratic band of the *Yanktongs* maintains its independence in the vast solitudes between the Red River and the Missouri, but partly mixed with the *Telons*, who are dispersed along both sides of the latter river, from the River Du Chien to the country of the Mahas and Minetaries. The bison supplies these tribes with food, clothes, dwellings, and saddles and bridles to their horses, of which they possess great numbers. The small band of the *Waschpecontes* hunts towards the sources of the River Des Moines.

The Sioux are the most warlike and independent of all the tribes in the territories of the United States. War is their delight. They understand the art of forming entrenchments of earth capable of protecting their wives and children from arrows and musket balls, when exposed to danger from the sudden incursions of an enemy. Traders may travel safely among these savages, if they avoid offending them in matters that touch their rude ideas of honour.

* These are rather pictorial representations of the objects described, than allegorical symbols, like the Egyptian hieroglyphics.—P.

On the other hand, no traveller loses their esteem by seeking vengeance for an injury he has received from one of their tribe. The articles they sell to the Americans are the skins of the tiger, deer, elk, beaver, otter, marten, the white, black, and gray fox, the musk rat, and racoon. Their guttural pronunciation, their prominent cheek bones, and their features generally, their manners and traditions, confirmed by the testimony of the neighbouring tribes, all indicate that they have emigrated from the north-western part of the continent. They write in hieroglyphics^a like the Mexicans.^b

The *Chippeways* inhabit the country on the west and south of Lake Superior, on Sand, Leech, Rainy, and Red Lakes, and towards the sources of the Chippeway, St. Croix, Red, Mississippi, and Corbeau Rivers. They are divided like the Sioux into several bands with distinct names. The Chippeways and Sioux carried on a ferocious contest with one another for two generations, till they were reconciled by Pike in 1805. The Chippeways have more gentleness and docility of character than the Sioux, but more coolness and resolution in battle. The Sioux are impetuous in their attacks; the Chippeways defend themselves with skill and address, taking advantage of the natural strength of their country, which is intersected by a multitude of lakes, rivers, and impassable marshes. The latter have, besides, the advantage of being all provided with fire-arms, while one half of the Sioux are armed only with arrows, which can do little execution in the woods. The Chippeways are immoderately addicted to the use of strong liquors, a vice in which they are encouraged by the traders, in order to obtain their furs on more advantageous terms. Among this tribe also, hieroglyphics cut in wood supply the place of written language.

Travellers describe with delight the fine features of the *Menominie*. Their physiognomy expresses at once gentleness and independence. They have a clearer complexion than the other indigenous tribes, large expressive eyes, fine teeth; they are well formed, and of middle stature, have much intelligence, and a patriarchal simplicity of manners. They dwell in spacious huts, formed with rush mats, like those of the Illinois. They repose upon the skins of bears and other animals killed in the chase. They drink the syrup of the maple. Though few in numbers, they are respected by all their neighbours, especially the Sioux and Chippeways. The whites consider them as friends and protectors. They live chiefly on the River Menomine, and at Green Bay in Lake Michigan, but hunt as far as the Mississippi. They speak a particular lan-

^b Pike's Travels.

guage, which the whites have never learned,^a but they all understand the Algonquin.^b

The *Winnebagoes*, who dwell on the Wisconsin, Rock, and Fox Rivers, speak the same language with the Ottoes of the River Platte, and, according to their own traditions, are the descendants of a nation who fled from Mexico to escape the oppression of the Spaniards. For 150 years they have lived under the protection of the Sioux, whom they profess to regard as brothers.

The *Ottogamies*, or *Foxes*, hunt from the river bearing their name to the Mississippi. They live in close alliance with the Sacs,^c and devote themselves to the culture of grain, beans, melons, but above all, maize, of which they are able to sell some hundred bushels annually. The *Sacs*, established upon the Mississippi above St. Louis, raise a considerable quantity of maize, beans, and melons. The *Ioways*, closely allied with the Sacs and Foxes, but less civilized and less depraved, cultivate a little maize, and push their hunting excursions even beyond the Missouri. They live on the Ioway and Desmoines Rivers.

Though the destruction of game in the civilized parts of the United States has induced the Indians gradually to retire farther back into the wilderness, there are still some small parties of them that live among the whites. Of these we shall speak very briefly.

A small remnant of the celebrated *Oneidas* live near the lake of that name in the state of New-York, where they have embraced Christianity, and adopted the industrious habits of American citizens. A still smaller party of the *Tuscaroras* reside near Lewistown, and have assumed the character of farmers. The *Senecas* and *Cornplanters* live on the Niagara, and at the head waters of the Alleghany River. Prior to the late war (1814) the whole number of persons belonging to the Six Nations, once so powerful, was estimated at 6330.^d About 150 of the *Narragansets* reside at Charlestown, in Rhode Island, where they have a school, which is supported by the Missionary Society of Boston.^e The Virginia Indians, once so numerous, are now reduced to thirty or forty individuals of the Nottaways, and about as many of the Pamunkeys, who reside in the south-eastern part of the state.^f

The most considerable Indian nations inhabiting the states east of the Mississippi, reside in the country south of the Ohio. The *Creeks*, or *Muskogees*, including the *Seminoles*,^g occupy districts in Georgia and Alabama. Their number in 1814 was estimated at 20,060, of whom 5000 were warriors. A part of them have made some progress in agriculture and the mechanic arts. They have cultivated fields, gardens, inclosures, herds of cattle, and different kinds of domestic manufactures.

The *Choctaws*, who inhabit the country between the Yazoo and Tombigbee Rivers,^h boasted some years since of 4041 warriors in forty-three villages, but are now re-

duced to less than one half of this number. The scarcity of game, and the example of the whites, has induced them to adopt agricultural habits. They have herds of swine and horned cattle, and manufacture their own clothing. The *Chiskasaws*, including about 1000 warriors, live in the neighbourhood of the Choctaws, and like them, cultivate corn, cotton, potatoes, and beet root, and have herds of cattle, sheep, and swine. Some of the best inns on the public road are kept by persons of this nation, and their zeal for improvement has led them to establish a school at their own expense.

The *Cherokees*, inhabiting the country about the mutual boundaries of Georgia, Alabama, and Tennessee, are perhaps farther advanced in civilization than any other of the Indian tribes. They inhabit the northern parts of Georgia and Alabama, and the southern borders of Tennessee. The tribe consisted in 1810 of 12,400 persons, including 583 slaves, and what is still more surprising, 341 white persons, of whom one third had Indian wives. The Cherokees have made considerable progress in husbandry and domestic manufactures. They raise cattle for the market, which multiply prodigiously in their fertile country. In 1810 they had 19,500 head of cattle, 6100 horses, 19,600 hogs, 1037 sheep, about 500 ploughs, 30 wagons, 1600 spinning wheels, 467 looms, 13 grist mills, 3 saw mills, 3 saltpetre works, 1 powder mill, 49 smiths. Like the whites, they commit the heavier labours of agriculture to their negro slaves. Men, women, and children, are addicted to the use of the bath, and are remarkably clean and neat in their persons. A young Cherokee woman refused an American suitor on the ground that he was not clean in his appearance. The practice of ablution, though formerly a religious rite, is now valued merely for its salutary effects on the body. A Missionary school was planted among this people in 1804, at which some hundreds of young Cherokees have received the rudiments of education. The *Catawba* tribe, who live near the Cherokees, mustered 1500 warriors when the whites first settled in their neighbourhood, but have now only 60.ⁱ In Louisiana are the *Houmas*, *Opelousas*, *Atakapas*, *Tunicas*, *Conchatas*, *Alabamas*, *Apalaches*, *Pacamas*, *Pascagoulas*, and other tribes, who were formerly numerous, but are now reduced to a feeble remnant, some of them not mustering more than a dozen of warriors, and few of them having more than 100.

Of the Indians who live in the country watered by the Missouri, the *Osages* are one of the most powerful nations. They live chiefly near the Osage River, and when Pike visited them, had 1252 warriors, and a total population of 4019. They have made some progress in agriculture: they cultivate maize, beans, and pumpkins, and have a fine race of horses and mules. The *Kansas*, who live on the river of the same name, have 465 warriors according to Pike, and raise corn, beans, and pumpkins. The *Ottos*

^a The language has been learned by the whites, but rarely. The whites carry on an intercourse with them in the Chippeway language.—P.

^b Chippeway.

^c Sauts.

^d The remains of the Six Nations in New-York, including the Stockbridge and Brotherton Indians, and a few of the Delawares, whom they have incorporated with them, is 4834, on fourteen reservations, containing more than 260,000 acres. The Mohawks and Cayugas emigrated into Canada after the American war, leaving only a few individuals in the United States. The number of the Six Nations in Canada has been estimated at 2250. They chiefly reside on Grand River, W. of York. There are 57 of the Mohawks settled on Sandusky River, Ohio. There are two villages of Senecas, containing a population of 550, in the W. part of Ohio.—*Morse's Report*.—P.

^e The Narragansets are about 420 in number, but few of them of pure Indian blood. The Society for Propagating the Gospel in North America, supports a missionary, and two schools, a part of the year, among them. They live by agriculture and fishing.—P.

^f There are about 50 individuals remaining of the Nottaways, Pamunkeys, and Mattaponies. They live on the W. side of Nottaway River, in Southampton County, Virginia.—*Morse's Report*, p. 341.—P.

^g The Seminoles, or Lower Creeks, live in Florida. They have been estimated at about 5000.—P.

^h The north part of the Choctaw territory extends to the Mississippi.—P.

ⁱ Present population 450.—*Morse's Report*.

on the Platte River, are reduced to 60 warriors; and of the *Missouris*, who once counted their warriors by thousands, only a remnant of thirty families exist. The *Mahas*,^a 800 in number, who live on the Maha Creek, lost two thirds of their population by the small-pox in 1802. The *Pawnees*, or *Panis*, divided into four tribes, include 1993 warriors, and 6223 souls. Higher up live the *Ricaras*, 3000 in number; the *Mandans*, 2000; the *Minetaries*, 2000; and the *Quehatsas*, 3560, who have their residence near the springs of the Yellowstone River, at the Rocky Mountains. Farther up are the *Snake* Indians, in number 8200; the *Chiens*, 1250; the *Towas*, 1400; the *Kites* and *Kiwas*, 3000; the *Utahs*, and *Tetaus*, 7000; the *Mamekas* and *Apeches*, 15,000; the *Kaninaviesch*, *Castahamas*, and *Katahas*, 6500; and the *Blackfeet Indians*, 5000. Most of these tribes wander between the sources of the Missouri and its branches, and the frontiers of Mexico. They live chiefly by hunting, and are partially supplied with fire-arms; but many of them raise maize, beans, melons, pumpkins, and some tobacco. The tribes situated near the Missouri carry on a considerable trade with the whites, exchanging their peltries and skins for cloth, iron articles, powder, and fire-arms.

There is a great diversity of language among these numerous tribes, and they are farther distinguished by their habits, manners, superstitions, and their implacable rancour and hostility against each other. In one respect, however, there is a general resemblance; like the Arabs, they wander from place to place over extensive tracts of country, which they claim by traditionary title or conquest. Some few of them have huts or permanent lodges; but these they often abandon to hunt the buffalo, the flesh of which affords them nourishment, as the skin does clothing. This rude and independent mode of life has so many attractions, that it is with difficulty renounced by those who have experienced the advantages of civilization. The complexion of all the Indians is of a copper colour, but lighter in some than in others. In general, their hair and eyes are black. The warriors are well proportioned, strong, and active, and have an air of dignity in their looks and gestures. Many of their young females have fine eyes, teeth, and hair, and regular features, with an agreeable expression; but owing to their wandering and laborious life, the growth of the body is checked before the usual period of maturity. Hence they are generally of low stature, and ungraceful in form, with high cheek bones, projecting eyes, and flat bosoms. In the mountainous districts, however, the women are less emaciated, of a lighter complexion, and more interesting. Several of the nations live almost naked; but of those who are clothed, the principal articles of dress are three. A buffalo robe is attached to the shoulders, and hangs down loosely; a piece of skin, in the form of an apron, covers the waist or middle; and a sort of rudely formed boots, called mocassins, are worn on the legs. The women wear a cloak like that of the men, and under it a petticoat, or robe of the skin of the elk or antelope, fastened to the waist by a girdle, and reaching to the knees. The tribes, however, who trade with the whites, often substitute coverings of woollen cloth, linen, or blankets, for skins, or wear them under their skin robes in cold weather. The chiefs fasten feathers to their heads, and distinguish themselves, especially on days of state and ceremony, by

showy vestments, and by various rude ornaments. Blue beads are worn on the neck, legs, and arms, and are highly valued by both sexes. They paint their faces red and black, which they consider highly ornamental. They paint themselves also when they go to war; but the method they make use of on this occasion differs from that which they employ merely for decoration. Some tribes bore their noses, and wear in them pendants of different sorts; and others slit their ears, and load the rim with brass wire, which drags it down almost to the shoulder.

The cabins of the Indians, though rudely constructed, are warm and comfortable. Those of the Sioux, of a circular form, and thirty or forty feet in diameter, are constructed of forked pieces of timber, six feet in length, placed in the ground, at small distances from each other, in a vertical position, supported by others in a slanting direction. Four taller beams placed in the middle serve as a support to the poles or rafters, which are covered with willow branches, interwoven with grass, and overlaid with grass or clay. The door, or entrance, is four feet wide, before which there is a sort of portico. A hole in the middle of the roof serves for the escape of smoke, and the admission of light. The beds and seats are formed of the skins of different animals. A platform raised three feet from the floor, and covered with the hairy skin of a bear, is reserved for the reception of guests. In other cases, the lodge is formed by a few poles meeting in the figure of a roof, and covered with rush mats or buffalo hides. It is taken asunder when they shift their residence, and carried by dogs to their new abode. The village consisting of a number of such huts irregularly disposed, is enclosed by a palisade of wood; but the Ricaras, and some other tribes, formerly protected their villages by a wall four feet high.

It may be remarked, that the Indians to the eastward of the Mississippi seldom make use of horses in travelling, hunting, or in war; while those to the westward of that river, employ them on all these occasions. This difference of custom is owing chiefly to the different state of the country, which, on the western side, consists of extensive open plains, while the eastern is broken, hilly, and covered with forests.

All the different nations are under the government of a chief and council, who are generally elected to office on account of their military talents, wisdom, and experience, though much art and dissimulation is sometimes employed to gain suffrages. These appoint municipal officers, who take charge of the peace of the villages. Their authority, however, is but limited: for as every Indian has a high opinion of his own consequence, and is extremely tenacious of his liberty, he instantly rejects with scorn every injunction that has the appearance of a command.

The object of government among them is rather foreign than domestic, for their attention seems more to be employed in preserving such a union among the members of their tribe as will enable them to watch the motions of their enemies, and to act against them with concert and vigour, than to maintain interior order by any public regulations. If a scheme that appears to be of service to the community is proposed by the chief, every one is at liberty to choose whether he will assist in carrying it on; for they have no compulsory laws that lay them under any restrictions. If

^a O'Mahas.

violence is committed, or blood is shed, the right of revenging these misdemeanors is left to the family of the injured; the chiefs assume neither the power of inflicting nor of moderating the punishment. In their councils every affair of consequence is debated; and no enterprise of the least moment undertaken, unless it meets with the general approbation of the chiefs. They commonly assemble in a hut or tent appropriated to this purpose, and being seated in a circle on the ground, the eldest chief rises and makes a speech; when he has concluded, another gets up; and thus they all speak, if necessary, by turns. On this occasion their language is nervous, and their manner of expression emphatical. Their style is adorned with images, comparisons, and strong metaphors, and is equal in allegories to that of any of the eastern nations. In all their set speeches they express themselves with much vehemence, but in common discourse according to our usual method of speech. The young men are suffered to be present at the councils, though they are not allowed to make a speech till they are regularly admitted; they, however, listen with great attention, and to show that they both understand and approve of the resolutions taken by the assembled chiefs, they frequently exclaim, "That is right," "That is good."^a

The women are condemned to all the drudgery of domestic life, and the labour of cultivating maize and esculent roots devolves upon them. They prepare and tan the skins of animals for clothing; join in the chase, and on their shoulders carry their children, with large pieces of the flesh of the buffalo. The wife of the chief, Little Raven, brought at once sixty pounds weight of dried meat, a pot of meal, and a robe, as a present to Captains Lewis and Clarke. Though marriage be founded on mutual affection, and is made with the consent of the father of the girl, the moment she becomes a wife her slavish obedience commences. She is considered as the property of her husband, who, for different offences, especially in case of elopement, may put her to death with impunity. One of the wives of a Minitaree chief eloped with her lover, by whom she was soon abandoned, and was afterwards obliged to seek protection in her father's house, where the chief repaired with a mind bent on deep revenge. The old men were smoking round the fire, in which he joined without seeming to recognize the unfortunate woman, till at the moment of departure he seized her by the hair, and dragging her near the door of the lodge, with one stroke of the tomahawk took away her life. He then suddenly departed, crying out, that, if revenge were sought, he was always to be found at his lodge. Yet this same chief is represented to have offered his wife or daughter to the embraces of a stranger. For an old tobacco-box, the first chief of the Mandan tribe lent his daughter to one of the exploring party. The Sioux husbands have been known to offer both their wives and daughters.

All the Missouri Indians believe in the existence of good and evil spirits, in sorceries, dreams, charms, and prognostications. Every extraordinary occurrence of life is ascribed to a supernatural cause. The residence of the agents of the good spirit is in the air; those of the evil genius reside on the earth. A chief of the Toways, who accompanied Major Stoddard to the seat of the American government, in 1805, had a curious shell in which he carried his tobacco. In passing through Kentucky, a citi-

zen expressed a desire for this article. The chief presented it to him, turned round, and observed to his companions, that the circumstance of his having parted with his tobacco shell, reminded him that he must shortly die; and such was the power of his imagination, that in the course of a few days he expired.

In every band or nation there is a select number who are styled the warriors, and who are always ready to act either offensively or defensively, as occasion requires. These are well armed, bearing the weapons commonly in use among them, which vary according to the situation of their countries. Such as have an intercourse with the Europeans make use of tomahawks, knives, and fire-arms; but those who have not an opportunity of purchasing these kinds of weapons, use bows and arrows, and also the Casse Tête or War-Club. The extension of empire is seldom a motive with these people to invade, and to commit depredations on the territories of those who happen to dwell near them. To secure the rights of hunting within particular limits, to maintain the liberty of passing through their accustomed tracks, and to guard those lands which they consider from a long tenure as their own, against any infringement, are the general causes of those dissensions that so often break out between the Indian nations, and which are carried on with so much animosity. The manner in which the Indians declare war against each other, is by sending a slave with a hatchet, the handle of which is painted red, to the nation which they intend to break with; and the messenger, notwithstanding the danger to which he is exposed from the sudden fury of those whom he thus sets at defiance, executes his commission with great fidelity.

The Indians seldom take the field in large bodies, as such numbers would require a greater degree of industry to provide for their subsistence, during their tedious marches through dreary forests, or long voyages over lakes and rivers, than they would care to bestow. Their armies are never encumbered with baggage or military stores. Each warrior, besides his weapons, carries with him only a mat, and whilst at a distance from the frontiers of the enemy, supports himself with the game he kills, or the fish he catches. After they have entered the enemy's country, no people can be more cautious and circumspect; fires are no longer lighted, no more shouting is heard, nor the game any longer pursued. They are not even permitted to speak; but must convey whatever they have to impart to each other by signs and motions. They now proceed wholly by stratagem and ambuscade. Having discovered their enemies, they send to reconnoitre them; and a council is immediately held, during which they speak only in whispers, to consider of the intelligence imparted by those who were sent out. The attack is generally made just before day-break, at which period they suppose their foes to be in their soundest sleep. Throughout the whole of the preceding night they will lie flat upon their faces, without stirring; and make their approaches in the same posture, creeping upon their hands and feet, till they are got within bowshot of those they have destined to destruction. On a signal given by the chief warrior, to which the whole body makes answer by the most hideous yells, they all start up, and discharging their arrows in the same instant, without giving their adversaries time to recover from the confusion into which they are thrown, pour in upon them with their war-clubs or tomahawks. When the Indians

^a Carver's Travels, chap. V.

succeed in their silent approaches, and are able to force the camp which they attack, a scene of horror, that exceeds description, ensues. The savage fierceness of the conquerors, and the desperation of the conquered, who well know what they have to expect should they fall alive into the hands of the assailants, occasion the most extraordinary exertions on both sides. The figure of the combatants, all besmeared with black and red paint, and covered with the blood of the slain, their horrid yells, and ungovernable fury, are not to be conceived by those who have never crossed the Atlantic.

When they have overcome an enemy, and victory is no longer doubtful, the conquerors first dispatch all such as they think they shall not be able to carry off without great trouble, and then endeavour to take as many prisoners as possible; after this they return to scalp those who are either dead or too much wounded to be taken with them. Having completed their purposes, and made as much havoc as possible, they immediately retire towards their own country with the spoil they have acquired, for fear of being pursued. The prisoners destined to death are soon led to the place of execution, which is generally in the centre of the camp or village; where, being stript, and every part of their bodies blackened, the skin of a crow or raven is fixed on their heads. They are then bound to a stake, with faggots heaped around them, and obliged, for the last time, to sing their death song. The warriors, for such it is only who commonly suffer this punishment, now recount with an audible voice all the brave actions they have performed, and pride themselves in the number of enemies they have killed. In this rehearsal they spare not even their tormentors, but strive, by every provoking tale they can invent, to irritate and insult them. Sometimes this has the desired effect, and the sufferers are dispatched sooner than they otherwise would have been. There are many other methods which the Indians make use of to put their prisoners to death, but these are only occasional; that of burning is most generally used. If any men are spared, they are commonly given to the widows that have lost their husbands by the hand of the enemy, should there be any such, to whom, if they happen to prove agreeable, they are soon married. But should the dame be otherwise engaged, the life of him who falls to her lot is in great danger; especially if she fancies that her late husband wants a slave in the country of spirits to which he is gone. The women are usually distributed to the men, from whom they do not fail of meeting with a favourable reception. The boys and girls are taken into the families of such as have need of them, and are considered as slaves; and it is not uncommon that they are sold in the same capacity to the European traders that come among them.^a

The Indians are extremely circumspect and deliberate in every word and action; there is nothing that hurries them into any intemperate warmth, but that inveteracy to their enemies, which is rooted in every Indian heart, and never can be eradicated. In all other instances they are cool, and remarkably cautious, taking care not to betray, on any account whatever, their emotions. If an Indian has discovered that a friend is in danger of being intercepted and cut off, by one to whom he has rendered himself obnoxious, he does not inform him in plain and explicit terms

of the danger he runs by pursuing the track near which his enemy lies in wait for him, but he first coolly asks him which way he is going that day; and having received his answer, with the same indifference tells him, that he has been informed that a dog lies near the spot, which might probably do him a mischief. This hint proves sufficient; and his friend avoids the danger with as much caution as if every design and motion of his enemy had been pointed out to him. This apathy often shows itself on occasions that would call forth all the fervour of a susceptible heart. If an Indian has been absent from his family and friends many months, either on a war or hunting party, when his wife or children meet him at some distance from his habitation, instead of the affectionate sensations that would naturally arise in the breast of more refined beings, and be productive of mutual congratulations, he continues his course without paying the least attention to those who surround him, till he arrives at his home. He there sits down, and with the same unconcern as if he had not been absent a day, smokes his pipe; those of his acquaintance, who have followed him, do the same; and perhaps it is several hours before he relates to them the incidents which have befallen him during his absence, though perhaps he has left a father, brother, or son, on the field, whose loss he ought to have lamented, or has been unsuccessful in the undertaking that called him from his home. If you tell an Indian that his children have greatly signalized themselves against an enemy, have taken many scalps, and brought home many prisoners, he does not appear to feel any extraordinary pleasure on the occasion; his answer generally is, "it is well," and he makes very little further inquiry about it. On the contrary, if you inform him that his children are slain or taken prisoners, he makes no complaints; he only replies, "It does not signify," and probably, for some time at least, asks not how it happened.^b

We mentioned before, (page 211,) that the number of Indians in the territories of the United States, was estimated at 457,000. The following statement, however, is rather more recent, and is also obtained from Dr. Morse.^c

In New-England	2247
New-York	5184
Ohio	2407
Michigan and North-West Territories	28,380
Illinois and Indiana	17,006
Southern states east of Mississippi	65,122
West of Mississippi and north of Missouri	33,150
Between Missouri and Red River	101,070
Between Red River and Rio del Norte	45,370
West of Rocky Mountains	171,200
	<hr/>
	471,136

The proportion which the warriors bear to the whole population varies, but is on an average one to five. "In Indian countries, where fish constitutes an article of food, the number in each family is about six; in other parts, where this article is wanting, it is about five."

As no material change has taken place in the mode of living of the Indians beyond the Mississippi and in the western territories, while the acquisition of fire-arms has perhaps rather increased their resources for subsistence, we have reason to believe that the aboriginal population is nearly as dense in these countries as it was in the whole of North America before the English settlements commenced. Hence it is probable that when the Indians

^a Carver's Travels, chap. IX.

^b *Ibid.* chap. III.

^c Hodgson's Letters from North America, vol. II. p. 394.

were lords of the continent from sea to sea, their number in the two millions of square miles, now claimed by the United States, did not exceed one million of souls, or was scarcely greater than that of the inhabitants of the three small states of Massachusetts, Rhode Island, and Connecticut, which occupy only the one hundred and sixtieth part of the surface. Even admitting that the use of spirits has deteriorated their habits, and thinned their numbers, we cannot suppose that the Indian population was ever more than twice as dense as at present, or that it exceeded one person for each square mile of surface. Now, in highly civilized countries, like France and England, the population is

VOL. II.—NCS. 77 & 78.

2G

at the rate of 150 or 200 persons to the square mile. It may safely be affirmed, therefore, that the same extent of land from which one Indian family derives a precarious and wretched subsistence, would support 150 families of civilized men in plenty and comfort. But most of the Indian tribes raise melons, beans, and maize; and were we to take the case of a people who lived entirely by hunting, the disproportion would be still greater. If God created the earth for the sustenance of mankind, this single consideration decides the question as to the sacredness of the Indian title to the lands which they roam over but do not in any reasonable sense occupy.

BOOK LXXXII.

THE DESCRIPTION OF AMERICA CONTINUED.

United States continued.—Manufactures, Commerce, Government, Religion, Manners, and Literature.

THE cheapness of land, and the great profits which farming affords, check the growth of manufactures in the United States. Linen, woollen, and cotton articles for domestic use, however, are made very generally in the farmer's houses, and fabrics of a finer kind, including fancy and ornamental articles, are now manufactured in extensive works in Pennsylvania, New-York, Rhode-Island, Connecticut, and Massachusetts. Cabinet ware, and the coarser species of iron work, are made in high perfection; and in ship-building, the construction of wooden bridges, and mill machinery, the Americans are probably superior to any nation in Europe. If not the actual inventors of steam navigation, they have the credit of giving the practical use of the invention to the world. According to the official returns in 1810, the whole value of the manufactures that year was 127,694,602 dollars, but allowing for articles omitted or under estimated, the true amount was computed to be 172,700,000 dollars. Supposing the growth of manufactures to have kept pace with that of the population, the amount, in 1823, would be about 240,000,000 of dollars, (52,000,000*l.* sterling.)

The commerce of the United States is second in extent only to that of Britain, and much greater than that of any state with an equal population. The principal articles of domestic growth or manufacture exported, are cotton, tobacco, wheat, and flour, Indian corn, lumber and naval stores, ashes, fish, beef, pork, rice, and flax seed. The imports consist chiefly of woollens, cottons, linens, silks, iron ware, coffee, sugar, spirits, wines. The states that have the greatest quantity of shipping are Massachusetts, New-York, Maine, Maryland, and Pennsylvania. A considerable proportion of the tonnage belonging to the northern states is employed in carrying away the produce of the southern, which have comparatively a small number of ships and mariners, though the cotton and tobacco raised in these states furnish fully one half of the exports of the Union. The vast number of navigable rivers in the United States, afford extraordinary facilities for communication by water; and hence their internal commerce, compared with that of other countries, is still greater than their foreign trade. The admirable invention of steam boats has had a most beneficial effect in North America in quickening and improving river navigation.

The Americans have made great and spirited exertions to improve their inland water communication by the con-

struction of canals. Besides the Middlesex canal, in Massachusetts, thirty-one miles long, the Lake Champlain, the Dismal Swamp, the Santee and Cooper River canals, each twenty-two miles long, and several of smaller extent, a canal has been formed to connect the Hudson with Lake Erie. It is four feet deep, forty feet wide at top, and twenty-eight at bottom: it has eighty-one locks, and an aggregate rise and fall of 654 feet; it is 362 miles long, and is estimated to cost about five millions of dollars. This great work is to be completed in 1824,^a and has been executed entirely at the expense of the single state of New-York, and within the short period of seven years.^b

Banks are extremely numerous in the United States; but the system of banking is bad. Of 400 of these establishments which existed in 1818, a great proportion had little or no real capital; and were merely a sort of gambling speculations, got up by knots of adventurers, and supported for a time by local influence or artifice, but ultimately falling down, and spreading distress and ruin among the industrious classes. Two thirds or more of these banks stopped payment in the four years ending 1820, and the circulating medium which, in 1815, was estimated at 110 millions of dollars, was reduced by these failures to 45 millions in 1819. The American banks generally issue notes for so small a sum as one dollar, and some of them for fractional parts of that coin. To remedy the disorders arising from the unsound state of the currency, the national bank was instituted by Congress in 1816, with a capital of 35,000,000 of dollars, divided into shares of 100 dollars each. Some peculiar privileges were bestowed on this bank, which had branches established in the principal cities of the Union; but the value of its stock has fluctuated much; and it has neither prospered nor supplied an efficient correction to the evils of the currency.^c

By an act of Congress, passed in 1792, the only legal tender in the United States is the dollar and its fractional parts. The dollar weighs 416 grains; and four dollars and forty-four cents are declared equal to a pound sterling. The national silver coins consist of the dollar, half, and quarter dollar;^d the first being equal to 100, the second to fifty, and the third to twenty-five cents. The gold coins are, the eagle, equal to ten dollars, and the half and quarter eagle, equal respectively to five and two and a half dollars. The gold coins of the United States are of the same quality with those of Britain and Portugal, the intrinsic value being at the rate of 100 cents for twenty-seven grains. The foot, yard, and acre, the gallon, pound avoirdupois,

^a It was completed in the autumn of 1825.

^b Duncan's Travels, I. 324.

^d Also the dime, or ten cent piece, and the half dime.

and pound troy, and the measures and weights of the United States universally, with some trifling local exceptions, are the same with those of England.^a

The governments of the United States, local and general, grew naturally out of the old colonial charters, which were founded on the constitutional law of England. The principles, therefore, of those harmonious and beautiful republican institutions of which America is justly proud, are the patrimonial gift of England; but it cannot be denied that the wisdom of American statesmen, and the free spirit of the people, have developed these principles more fully, raised those institutions to a degree of perfection hitherto unexampled, and realized a system of polity more economical, orderly, and rational, and more conducive to human improvement, to national prosperity and happiness, than any that has yet existed in the world. It affords indeed an encouraging view of the future fortunes of mankind, to observe how much more surely men are conducted to sound conclusions on all questions of practical importance, by the general progress of knowledge, and the instinct of self-interest operating in society at large, than by the speculations of the philosopher. Plato, Sir Thomas More, Harrington, and Hume, have all exerted their ingenuity in framing the plan of a perfect commonwealth, in which the fullest measure of liberty should be conjoined with order, justice, good government, and pure morality in private life. But what they looked upon almost as an ideal good, rather to be desired than hoped for, and what they merely endeavoured to approach to, by an apparatus the most refined and complicated, by institutions calculated to force nature, and by impracticable schemes of moral discipline, has been realized to an extent far beyond their hopes, by mechanism infinitely more simple and natural than what they proposed, and infinitely more certain and constant in its operation.

The legislative power in the United States is separated into two branches, and the government is therefore twofold. To the state governments is committed that branch which relates to the regulation of internal concerns. These bodies make and alter the laws which regard property and private rights, regulate the police, appoint the judges and civil officers, impose taxes for state purposes, and exercise all other rights and powers not vested in the federal government by positive enactment. To the federal government belongs the power of making peace and war with foreign nations, raising and supporting an army and navy, fixing the organization of the militia, imposing taxes for the common defence or benefit of the union, borrowing money, coining money, and fixing the standard of weights and measures, establishing post offices and post roads, granting patents for inventions, and exclusive copyrights to authors, regulating commerce with foreign nations, establishing uniform bankrupt laws, and a uniform rule of naturalization, and lastly, the federal tribunals judge of felonies and piracies committed on the high seas, of offences against the law of nations, and of questions between the citizens of different states. It is remarkable that though the powers of the federal and local governments necessarily interfere in some points, it is very rare that any contest or collision has arisen out of this circumstance. The foundation of this harmony obviously is, that both Congress and the state legislatures are merely the organs of the same uni-

versal interest—that of the people, and have no independent existence. Were the power in both cases in the hands of oligarchies, who held it in despite of the people, and for their private emolument, there would be quarrels and contests in abundance.

The old division of governments into monarchies, aristocracies, and democracies, though not altogether unfounded, is of very little use, and should be laid aside. The radical distinction among governments, is between those which are conducted by men who derive their power from the people, and are responsible to them; and those which are conducted by Juntos, less or more numerous, over whom the people have no direct control. Whether the power in the latter case is exercised by the king and the chiefs of the army, as in Prussia, or by a club of nobles, as formerly in Venice, or by a king and packed chambers, as in France, may make some difference in the temper of the administration, but will make none in the essential character of the government. The former deserve the name of *national* governments; the latter, for want of a better term, may be called *oligarchical*. If we judge of the American system of government according to the principles of this classification, we shall perceive that it is purely a *national* government, and stands totally distinct from every other which has hitherto existed.

In the old governments of continental Europe, the king, whose authority is self-existent, and who, according to the usual mode of speaking, is responsible to God alone for his actions, is the sole fountain of power. From him judges, military officers, ministers of religion, teachers of youth, magistrates, and police officers of all classes, down to the petty constable, derive their authority, and to him alone they are accountable for their conduct. The people confer no office, and exercise no power, but live in a state of perpetual pupillage and dependence.

In the United States, on the contrary, the sovereignty resides not figuratively, but really, in the mass of the people. From them all power emanates, and to them the highest functionary as well as the lowest feels that he is amenable for his acts. The humblest individual assists by delegation in forming the laws under which he lives, disposes by his vote of the highest office in the state, and may obtain it himself if he can gain the confidence of his fellow-citizens. The people at large are daily in the exercise of political functions, and every one who holds a place of trust, derives his authority either directly from popular suffrage, or from persons who owe their power to the people's choice, and are responsible to them for the use they make of it. Something approaching to this, in a distant degree, may be found in the British constitution; but it may be safely said, that the American government is the first which has ever been fairly bottomed on the broad principle of the sovereignty of the people.

In the earlier constitutions of several of the states, the right of suffrage was confined to persons possessing freeholds, or some small property; but experience seems to have decided in favour of a broader principle. In the new states the right of suffrage may be described as universal, being extended to all who pay taxes (slaves excepted); and in the amended constitutions of most of the old states, the same rule has been adopted. The mode of voting at elections is generally by ballot.

The Federal government of the United States consists of a President, a Senate, and a House of Representatives

^a Warden, III. 439.

The President is chosen for four years, by delegates elected for this purpose by the people, and equal in number for each state, to the members it sends to Congress. The Vice-President is elected in the same manner, and for the same period; but both are generally re-elected for four years more, and so serve eight years. The president is commander-in-chief of the army and navy, and of the militia when in active service. He grants reprieves and pardons for offences against the United States, except in cases of impeachment. With the advice and concurrence of the Senate, he makes treaties, nominates ambassadors, consuls, judges: and he appoints several other officers by his own authority. He must be a native born citizen, not under thirty-five years of age, and he receives a salary of 25,000 dollars (5500*l.*) per annum.

The Senate consists of forty-eight members, namely, two for each state, who are chosen not by the people, but by the legislatures of the several states, and hold their office for six years, one third of the members being removed every two years. A senator must be thirty years of age, an inhabitant of the state for which he is chosen, and he must have been a citizen of the United States for nine years.

The House of Representatives consists now of 212 members, (1824,) who are chosen for two years, by the persons who elect the corresponding branches of the state legislatures, that is, with some few exceptions, by the mass of the adult population. The representatives are distributed among the states, in the proportion of one for every 42,000 inhabitants, excluding the Indians and two fifths of the people of colour. Even free persons of colour, however, have no vote, except in one or two states.^a A representative must be twenty-five years of age, an inhabitant of the state for which he is chosen, and he must have been a citizen of the United States for seven years. Senators and representatives receive an allowance of eight dollars per day for the time they attend the session of Congress, and eight dollars of travelling charges, for every twenty miles they have to travel in going and returning. Members of Congress take an oath to support the constitution, but no religious test is required from them, or any person holding office under the Federal government. Senators and representatives vacate their places if they accept of an office under government, and are not re-eligible while they hold it.

The forms of business in Congress are chiefly borrowed from those of the British parliament. Bills are read three times, and in a certain stage sent to committees; but what is deemed an improvement, eight standing committees^b for commerce, finance, foreign affairs, &c. are appointed in the House of Representatives, at the commencement of each session. All money bills must originate in the House of Representatives, a regulation which had its birth in circumstances which have long ceased to exist, and may now be pronounced ridiculous, even in England. A bill, after having passed both houses, is submitted to the president. If he sign it, it has the force of law forthwith. If he disapprove of it, he returns it to the house in which it originated, with his objections, for reconsideration; and after being reconsidered, if it pass both houses by a majority of two thirds, it becomes a law; otherwise it falls to the ground. This qualified *veto* has been sometimes exercised, and is probably of more real value, than an absolute *veto*,

like that of the king of Britain, which is practically a dead letter. From causes not difficult to trace, lawyers predominate in Congress far beyond their just proportion to the other classes of the population. To persons of this profession, especially those of short standing, both the pay and the honour of serving in Congress, are objects of some importance; and in a country where all are busy, such lawyers can absent themselves from their usual residence, with less inconvenience, than merchants or farmers. It is besides natural that the people should commit the charge of their public interests in preference to those persons who make the laws and constitution of the country their study, and who are supposed to be peculiarly qualified by their habits to assert the claims of those who employ them. To the predominance of this class of persons, and to other circumstances in the composition of Congress, we must also ascribe it, that the discussions on an interesting question, instead of being closed at a single sitting, as in the British parliament, are sometimes protracted for ten or twelve days. First, a person really responsible to his constituents, and receiving their pay, naturally considers himself in some measure as their agent or procurator, sent to Congress to watch over their interests, and conduct their business. Such a person gives closer attendance, and makes more regular exertions, than a man of family and fortune, who serves for honour, is responsible to nobody, and has no other stimulus to act than a vague feeling of public duty. Speeches for show, in acquittal as it were of the debt due to their constituents, and sometimes, perhaps, to the hinderance of business, will occasionally be made by representatives of the former description. In the second place, though Congress is not a stranger to party spirit, it is certain that the members are not so regularly enlisted into two adverse factions as in the British parliament, and that in the greater number of cases, the decision is more governed by argument and public feeling, and less by party connexion. Debating, therefore, partakes less of the nature of dialectical parade, and more of that of a real contest, in which victory may be presumed to rest with those who have the most imposing show of reason on their side. To this we must add, that though the House of Representatives is comparatively a small body, the usual attendance is fuller than in the House of Commons. Forty members (out of 658) constitute a *quorum* for conducting business in the latter, and 107 (out of 212) in the former. The composition of the House of Representatives in 1822 was as follows:—

Lawyers	97	Manufacturers	3
Farmers	54	Printers	2
Physicians	15	Clergymen	3
Merchants	13		
			187 ^c

New elections produce a change of members much more frequently than in the House of Commons. At the general election in 1821, the number of new members was ninety-two, but this was considered rather a greater change than usual.

The scale of pay for public officers in the United States is remarkably, perhaps injudiciously, moderate, as will be seen from the following table:—

	Dollars.	Pounds Sterling.
President	25,000	5500
Vice-President	5000	1100

^a See note, p. 220.

^b At present the number of standing committees is much greater.—P.

^c Niles' Register for 22d June, 1822. 187 was then the full number of members.

	Dollars.	Pounds Sterling.
Secretary of State	5000	1100
Secretary of the Treasury	5000	1100
Comptroller	3500	770
Auditor	3000	660
Treasurer	3000	660
Secretary of War	4500	990
Secretary of the Navy	4500	990
The three Commissioners of the Navy Board, each	3500	770
Postmaster-General	3000	660
Secretary of the Senate	3000	660
Secretary of the House of Representatives	3000	660
The Chief Justice of Supreme Court	4000	880
Six Associate Justices, each	3500	770
Attorney General	3000	660
Ambassadors to England, France, Russia, &c. seven in number, each	9000	2000
Secretaries of Legation, each	2000	440
Consuls in London, Paris, &c.	2000	440

The federal judiciary consists of a supreme court, which sits at Washington, and a district court in each state, in which one judge sits. In the supreme court, there is a chief judge and six associate judges, who hold their office during good behaviour. This court has *original* jurisdiction in all cases affecting ambassadors and consuls, and those in which a state is a party. It has *appellate* jurisdiction in all cases arising under the Federal constitution, in all admiralty cases, in controversies between two states, or two citizens of different states, and between a state, or the citizens thereof, and foreign states or subjects. The supreme court, deriving its authority from the constitution, exercises a power not enjoyed by the inferior courts. It has refused to give effect to, and by this means has virtually annulled, several acts of the state legislatures, and even of Congress itself, on the ground that these acts, by "impairing the obligation of contracts," violated a rule made binding by the constitution on the legislative bodies.^b The Federal judges are appointed by the executive, with the approbation of the Senate. In this and the other Federal courts, jurors and witnesses are allowed 1½ dollars a-day, and five cents per mile of travelling charges. The basis of the system of law in the United States is the *common* law of England, modified by acts of the general and state governments, which constitute the *written* law; and the works not only of Coke and Blackstone, but of the most recent English writers, and even the latest Term Reports, are familiarly cited in the courts.

The state governments are extremely similar to that of the Federal body in their composition. The legislature consists always of two branches, both of which are returned by the same electors; and these electors may be said to comprise the whole adult white population, the usual qualifications being citizenship, with one or two years residence, and payment of taxes. The only exceptions are the following:—In Vermont, the legislature consists of a House of Representatives only; in North Carolina, representatives are chosen by the whole resident free citizens, (who pay taxes,) but senators only by freeholders; in New-Jersey and in Virginia, the right of suffrage for both houses is limited to persons holding a small amount of landed property; in Maryland, the senators are chosen by delegates named for the purpose by the people.

In all the states, the period for which the representatives serve is either *one* or *two* years. The elections are *biennial* in South Carolina, Tennessee, Louisiana, Illinois, and Missouri, and *annual* in the other nineteen states.

^b Warden, chap. XL.

Down to 1818, the elections were semi-annual in Connecticut.

The shortest period for which the senators serve in any state is *one* year, and the longest *five*. In Maine, New-Hampshire, Massachussets, Rhode Island, Connecticut, New-Jersey, North Carolina, Georgia, the senators hold their office for *one* year only; in Ohio and Tennessee for *two* years; in Delaware, Mississippi, Alabama, Indiana, for *three* years; in New-York, Pennsylvania, Virginia, South Carolina, Kentucky, Louisiana, Illinois, Missouri, for *four* years; and in Maryland, for *five* years. Except in Maryland, when the senate of any state serves for more than one year, it is renewed by parts or divisions, one-third of the members going out annually when they serve for three years, and one fourth when they serve for four. In some cases, however, when the senators serve for four years, the renewal is by halves every two years.

No government, however perfect when first established, can continue good, unless its mechanism is such that it can adapt itself to the changes which take place in society. A scheme of legislation absolutely fixed, although it were the work of angels, would come in time to have the vices of a despotism. Hence, in all the new, and in most of the older, state constitutions, and in the federal constitutions also, provision is made for adopting amendments. In some of the states, alterations in the constitution may be made by the votes of two successive legislatures; and as the representatives in these states are elected annually, this does substantially involve an appeal to the people. But the general rule is, that no change can be introduced without an express reference to the opinions of the people, who either decide upon the amendment proposed in their district meetings, or elect delegates for the special purpose, who meet in convention, and decide for them. This admirable contrivance keeps the public institutions in harmony with the state of knowledge and opinion, checks the growth of abuses, prevents the state governments from degenerating into oligarchies, and destroys the seeds of convulsion and revolution, by affording an easy process for effecting those necessary changes which, in other countries, can only be accomplished by violence. Nor has this arrangement given birth to a restless spirit of innovation. Alterations have neither been numerous nor rashly gone about; and in all the states, the people have shown themselves disposed rather to bear with small inconveniences than to hazard changes of doubtful advantage. New states, however, are added to the republic from time to time, and in the forming of new, and amending of old constitutions, experiments are constantly making in the theory of government. For the first time in the history of the world, these are conducted with perfect fairness, and on rational principles; and if, therefore, we attend to the composition of the more recent, and the changes introduced into the older systems of legislation we shall ascertain what are those principles in favour of which experience seems to have decided in the United States. These may be stated in a few words. 1. There is evidently a disposition in the people of the United States to abolish all restrictions on the right of suffrage, to render it virtually universal, and to adopt the method of voting by ballot. 2. In the composition of the chamber of representatives, a preference is shown for annual elections. 3. A longer

^b North American Review for Jan. 1820. Fed. Constitution, Art. I. Sect. 10.

term of service is preferred for the senate ; and four years seem to be considered the most suitable period. 4. With this longer period is conjoined the method of partial renewal, which deserves to be considered a material improvement in legislation. In the federal government, which requires greater stability of character and purpose, a duration of two years has been judiciously assigned to the house of representatives, and six years to the senate. 5. In the old states, the governor is elected generally for one year ; in the new, for three or four years : and in all the states by the people, except in New-Jersey, Maryland, Virginia, the two Carolinas, and Georgia, where he is chosen by the legislature. He generally possesses the power of granting reprieves and pardons, the patronage of many public offices, and a qualified negative on the acts of the legislature. In exercising some of his functions, however, he must have the concurrence of the senate, which acts as his standing council ; but in a few of the old states, a special council, distinct from the senate, is appointed for this purpose. It ought to be observed, with regard to the two bodies denominated the Senate, and the Assembly or House of Representatives, that as they are both returned by the same electors, they represent one and the same interest, that of the people. The use of the second body is merely to insure greater deliberation in the public acts and resolves. There is no opposition of interest between the two ; nor is the one essentially more aristocratic than the other. The laughable quackery of a legislative balance between aristocracy and democracy is unknown in the United States.

In seven states out of the twenty-four, the senate can originate money bills ; in the others, the rule of the British parliament is servilely copied, without the shadow of a reason. In Virginia, all bills whatever must originate in the house of representatives. The right of impeachment is generally lodged in the latter body, and the power of judging the accused in the senate. But in some states the rule is, that high public officers impeached of crimes shall be tried by the ordinary courts. Massachusetts gives the titles of *his Excellency* and *his Honour* to the governor and lieutenant-governor of the state ; but none of the other states sanction or bestow any titles. In Pennsylvania, Mississippi, and Tennessee, a belief in a Deity, and in a future state of rewards and punishments, and in Massachusetts, Maryland, and North Carolina, a belief in the Christian religion, is required as a qualification for office. In New-Jersey no *protestant* can be excluded. In the other states no religious test is required. Clergymen are not eligible as members of the legislature, or as public officers of any description, except in a few states.

In eighteen states, the judges of the superior courts hold their commissions "during good behaviour,"^a subject in a few cases to a restriction on account of old age ; and

^a Judges and other persons holding offices "during good behaviour," are removable therefrom by a joint resolution of the two Houses of the Legislature ; but in general, more than a simple majority is required to pass such resolution.

^b For a fuller account of the American governments, see the Disquisition subjoined to Hall's Travels, (1818,) the *Federalist*, a collection of political essays, often reprinted in the United States, Warden, vol. III. and a set of the constitutions of the different states, also often reprinted. That which we have used, was printed in 1820 and 1821. The American government, considering the novelty of its plan, has attracted less attention in Europe, than might have been expected. Its spirit and character, however, have been described by one gifted observer, with an eloquence worthy of so noble a theme ; and we deem no apology necessary for inserting the following extracts from the splendid speech delivered by

in all these states, they are either simply nominated by the governor, or appointed by the governor and council (or senate) jointly, or elected by the legislature. They are chosen *annually* by the legislature in Rhode Island and Vermont ; elected by the people for *three* years in Georgia ; and appointed for *seven* years by the legislature in New-Jersey and Ohio, and by the governor in Indiana. Justices of peace are sometimes appointed by the governor, sometimes elected by the people, and generally hold their offices for three, four, or seven years. Sheriffs and coroners are chosen for a limited time by the inhabitants of each county, and constables by the inhabitants of each township. In the militia, which comprises all the males between the ages of eighteen and forty-five, the captains and subalterns are elected by the companies ; the field officers generally by the captains and subalterns ; the brigadiers and major-generals sometimes by the field officers, and sometimes by the civil authorities.

Electioneering contests are conducted with much keenness in the United States, but chiefly through the agency of the press. The voting, which is almost universally by ballot, is concluded in one day ; and those mobs and tumults, and scenes of beastly debauchery, which often disgrace English elections, are there almost entirely unknown. When the office is of much importance, such as that of governor of a state, it is usual for the leading men of each party in the legislature, to meet privately and pass a resolution in favour of one of the candidates, which is published : and the person who is thus recommended rarely fails to obtain the votes of the whole party out of doors, and to carry the election if that party is the most numerous. This preparatory meeting receives the cant name of *Caucus*. The power thus assumed by a few individuals to direct the public choice, or in other words, to decide for the whole population, has been strongly censured by some enlightened men. It may certainly be abused ; but the abuse will probably supply its own corrective. It is obviously a device to *unite* the votes of a party in favour of one person ; or, in other words, to prevent the more numerous party from losing the advantage of its superiority by subdividing its force.

Such is a sketch of the political system of the United States, which well merits the attention of the philosopher. Whether such a system would be practicable in older countries, is a question we do not presume to discuss ; but its utility in America is beyond dispute. "It has survived the tender period of infancy, and outlived the prophecies of its downfall. By the triumph of the democratic party, its principles have been fostered into maturity. It has borne the nation triumphantly through a period of domestic difficulty and external danger ; it has been found serviceable in peace and in war, and may well claim from the nation it has saved and honoured, the votive benediction of *esto perpetua*."^b

Mr. Jeffrey, at a public meeting in Edinburgh, in January, 1824, as given in the *Scotsman* newspaper.

"To my mind, that nation has already done the most essential service to the cause of freedom—not perhaps so much by the conduct of her people, or by the acts of her government, as by her mere existence—in peace, respect, and prosperity, under institutions more practically popular, and a constitution more purely democratic, than has ever prevailed among civilized men from the beginning of the world—thus affording a splendid illustration, and irrefragable proof, of the possibility of reconciling the utmost extent of freedom with the maintenance of public authority, and the greatest order and tranquillity, and security to private rights, with the most unbounded exercise of political ones. What else, indeed, can furnish so conclusive and triumphant a refutation of the pitiful sophisms and absurd predictions, by which the advocates of ex-

The example of the United States proves, that the expensiveness of a government is no test of its efficiency or real excellence, and that the cheapest political system may sometimes be the best. No taxes are raised within the country for the support of the federal government, the produce of the customs levied at the ports on the importation of foreign goods, and the sums derived from the sale of the public lands, constituting the whole of the public revenue. The annual amount of the revenue, expenditure, and debt, will be found in a table annexed to this chapter. The following statement is taken from the *Estimates* for 1824.

REVENUE, 1824.			
	Dollars.	Pounds Sterling.	
Customs,	16,500,000	3,630,000	
Public lands	1,600,000	350,000	
Bank dividends,	350,000	77,000	
Arrears and repayments,	100,000	22,000	
	18,550,000	4,079,000	
EXPENDITURE.			
Civil, diplomatic, and miscellaneous,	1,814,057	399,000	
Military department, including fortifications, ordnance, pensions, army, militia, and Indian department,	5,122,268	1,127,000	
Naval service, including gradual increase of navy,	2,973,927	654,000	
Public debt,	5,314,000	1,169,000	
	15,224,252	3,349,000	

The average produce of the customs may be estimated at from 16,000,000 to 18,000,000 dollars, and the sum derived from the sale of public lands at 1,600,000. The bank dividends consist of the interest of 7,000,000 dollars of capital, vested by the government in the national bank.

isting abuse have at all times endeavoured to create a jealousy, and apprehension of reform? You cannot touch the most corrupt and imbecile government, without unsettling the principles and unhooking the frame of society—you cannot give the people political rights, without encouraging them to be disobedient to lawful authority, and sowing the seeds of continual rebellion, and perpetual discontent—nor recognise popular pretensions in any shape, without coming ultimately to the abolition of all distinctions, and the division and destruction of all property—without involving society, in short, in disorders at once frightful and contemptible, and reducing all things to the level of an insecure, and ignoble, and bloody equality.—Such are the reasonings by which we are now to be persuaded, that liberty is incompatible with private happiness or national prosperity, and that the despotic governments of the world ought to be maintained, if it were only to protect the people from the consequences of allowing them any control over the conduct of their rulers! To these, we need not now answer in words, or by reference to past and questionable examples—but we put them down at once, and trample them contemptuously to the earth, by a short appeal to the *existence and condition of America!* What is the country of the universe, I would now ask, in which property is most sacred, or industry most sure of its reward? Where is the authority of law most omnipotent? Where is intelligence and wealth most widely diffused and most rapidly progressive? Where is society in its general description most peaceable, and orderly, and moral, and contented? Where are popular tumults least known, and the spirit and existence, and almost the name, of a mob least heard of? Where, in short, is political animosity least prevalent—*faction* subdued—and, at this moment, even *party* nearly extinguished, in a prevailing feeling of national pride and satisfaction? Where, but in America? America, that laid the foundation of her Republican Constitution in a violent, radical, sanguinary revolution—America, with her fundamental democracy, made more unmanageable, and apparently more hazardous, by being broken up into I do not know how many confederated and independent democracies—America, with Universal Suffrage, and monthly or weekly elections—with a free and unlicensed press—without an established priesthood, an hereditary nobility, or a permanent executive—with all that is combustible, in short, and pregnant with danger, on the hypothesis of tyranny, and without one of the checks or safeguards by which alone they contend the benefits of the very being of society can be maintained!—There is something at once audacious and ridiculous in maintaining such doctrines in the face of such experience: Nor can any thing be founded on the novelty of these institutions, or the pretence that they have not yet been put fairly on their trial.—America has gone on prospering under them for *forty years*—and has exhibited a picture of uninterrupted, rapid, unprecedented advances in wealth, population, intelligence, and concord, while

The Post-office yields about a million of dollars a year; but it is wholly consumed in supporting the establishment. The entire revenue of the United States may be estimated on an average at four millions, or four millions and a quarter sterling; and the annual expense of the government, under the three heads of civil, military, and naval, at 10,000,000 dollars, (2,200,000*l.*) This is at the rate of one dollar per annum for each inhabitant. If we add one dollar more for the sums levied by the state governments, the whole expense of the American government will be at the rate of two dollars for each inhabitant.

The debt of the United States consists of sums borrowed during the revolutionary war, and at various subsequent periods. The debt due by the federal government, at the close of the war in 1783, was 42,000,375 dollars. No proper provision being made for payment of the interest, and the public revenue often falling short of the expenditure, the debt continued to increase, and in 1790 it amounted to 79,124,464 dollars.^a Various measures were taken, for its liquidation, but with little effect, till about the middle of Mr. Jefferson's administration in 1805. From that period a gradual reduction took place, till it was stopped by the war with England in 1812.

	Dollars.
In 1812 the amount of the public debt was	45,035,123
In consequence of the loans made during the war, it amounted in 1816 to ^b	123,016,375
Considerable progress has since been made in paying off the debt, and on the 1st January, 1824, it was reduced to	90,177,962
And by the operation of a balance accumulating in the treasury, it is expected that at the 1st January, 1825, it will be reduced to	80,000,000
—or £17,600,000 sterling. ^c	

all the arbitrary governments of the old world have been overrun with bankruptcies, conspiracies, rebellions, and revolutions, and are at this moment trembling in the consciousness of their insecurity, and vainly endeavouring to repress irrepressible discontents, by confederated violence and terror. If any thing more were required to show the superior security, as well as energy and happiness of free government, I must beg merely to contrast the condition of South America, as it was till very lately—with that of the happy country to which I have been referring. These southern settlements had the advantage of being earlier established, and followed from the first by the fostering care of the parent state.—They were placed in a more fertile soil and a more propitious climate; but they were governed by non-resident despots, and given over to bigoted priests and courtly favourites, and wanting freedom, all the blessings of nature were turned to curses. Their treasures were exhausted—the population withered and shrunk under them—both races were degraded by their mixture—and they became at last among the governing classes a degenerated and corrupted mass, which mouldered away, and dissolved in its own rottenness—till it fertilized the soil over which it was scattered, for that rising and glorious harvest of liberty which now covers it with the beauty of its promise! In the north, the lot of our emigrant countrymen was cast in more ungenial regions—and their first struggles, either totally neglected or but coldly supported by the mother country—but, carrying with them that innate love of freedom which I trust will run for ever in the blood of all Britons, they surmounted all difficulties—and even under the colonial and not always equitable government of England, they made very considerable advances in wealth and civilization; and ever since they have been left to build for themselves on this firm foundation, have so multiplied and increased in the land, and advanced with such marvellous rapidity in wealth, population, industry, and power, as not only to put to shame the stationary communities of Europe, but even to make her statist and political economists revise and re-model their systems, to correspond with their unnatural and excessive prosperity! Such are the services which I conceive America to have rendered to the cause of liberty—and though they are, as I apprehend, truly incalculable in value and amount, it is pleasing to think that they have been rendered, not only without sacrifice or effort on her part—but almost without her consciousness or co-operation. They have flowed like a healing virtue from her existence and her example. She has only had to be free; and peaceful, and happy, and prosperous in her freedom, to put down the disgusting sophistry of the hireling advocates of power, and to give the strongest encouragement to all the nations of the earth to emulate her happiness and peace by imitating her freedom!"

^a Seybert's Statistical Annals, p. 720.

^b *Ibid.* p. 752.

^c American Papers, March, 1824.

The duties of customs are levied on foreign articles imported, and are partly *ad valorem*, and partly according to fixed rates. The duties on manufactured goods, of iron, cotton, and woollen, were from 20 to 30 per cent, but have been increased from a fifth to a fourth, by a new tariff established in 1824.

A standing army is necessarily an object of jealousy in a republican state; and as the North Americans have no formidable enemy in their vicinity, and are at the same time extremely studious of economy in all the branches of their government, their military force has always been kept on a very low scale. By an act of Congress of 3d March, 1815, the strength of the regular army was fixed at 9980 men, viz. eight battalions of artillery, 3200 men; one regiment light artillery, 660; eight regiments of infantry, 5440; and one regiment of riflemen, 680.^a In 1821 it was reduced to 6442 men, whose pay, clothing, &c. cost the state 1,927,179 dollars, or 299 dollars (66l.) for each individual, officers and privates. And in March, 1822, its strength, as reported to Congress, was as follows;^b—

Engineers,	23
Four Regiments of Artillery,	1977
Seven Regiments of Infantry,	3367
Ordnance Men,	53
	5420

The militia, which constitutes the principal military force of the United States, consists of all the males between the ages of eighteen and forty-five. According to a return made in the end of 1823, it amounted to 993,281 men. The American militia, as we have already stated, elect their own officers. When called into the field for actual service, they have the same pay and allowances as the regular army, but are only bound to serve for six months.

The navy of the United States is small in point of numerical strength, but is perhaps the best organized and most effective in the world. The unexpected and astonishing success of their frigates in combats with British vessels of the same class during the late war, established at once the reputation of the American navy for skill and prowess in the eyes of Europe; and the United States, with a very few ships, already rank high as a naval power. From 1816 to 1821, one million of dollars was expended annually in building ships of war. Since 1821 the sum thus appropriated has been reduced one half. A few ships are always kept in commission, and stationed partly in the West Indies, partly in the Mediterranean to keep in check the Barbary powers, and partly in the Pacific. In November, 1823, the strength of the American navy was as follows:—

	In Com- mission.	In Ordi- nary.	Building.
Ships of the Line,	1	6	5
Frigates,	3	4	5
Smaller Vessels,	12	2	—
Steam Frigates,	—	3	—

This is exclusive of the vessels on the lakes, which consist of two of 74 guns, one of 44, one of 36, one of 32, one

of 26, two of 24, eleven smaller vessels, and fourteen gun-boats—some being unfinished, and others considerably decayed.

A table of the population of the several states will be found annexed to this book. That of the principal towns in 1820 was as follows:—

New-York,	123,706	Boston,	43,940
Philadelphia,	114,410	New-Orleans,	27,176
Baltimore,	62,738	Charleston,	24,780

It was reserved for the lawgivers of the United States to make the bold experiment of dispensing with a state religion. In New-Hampshire the legislature is empowered to *authorise*, and in Massachusetts the legislature is enjoined to require, the several towns and parishes to make adequate provision, at their own expense, for the support of *Protestant* ministers.^c But in all the other twenty-two states the support of religion is left entirely to the voluntary zeal of its professors. The result has shown that Christianity has a firm hold in the nature of man, and is rather injured than served by those costly establishments, which so often abridge or extinguish free inquiry and liberty of conscience, engender fierce animosities among rival sects, perpetuate the errors and dogmas of unenlightened times, and degrade religion into an engine of civil tyranny, or the ally of ignorance and imposture. In the large towns and populous places of New-England, New-York, and Pennsylvania, religious instruction is more faithfully and abundantly dispensed, and religious ordinances are more strictly and universally observed, than in any other country in the world.^d To this advantage, we may add, that of the peace and harmony which reigns among the different religious communities, and the entire absence of those jealousies, bickerings, and heart-burnings, which the exaltation of a single sect so invariably creates. In the newly settled districts, where a small population is spread over a wide surface, the means of religious instruction are often deficient, and must be so, even were the wealth of an establishment expended in providing them.

The most numerous sects are the Congregationalists, Baptists, and Methodists. The Congregationalists, or Independents, abound chiefly in New-England, and have about 1200 congregations, some of which use organs in their public worship. The Baptists, who are most numerous in the middle, southern, and western states, had 2727 churches in 1817, and have now about 3000; but as their congregations in New-England are estimated by Dr. Morse only at 250 persons each, while those of the Congregationalists average about 1000,^e the latter are probably more numerous upon the whole. The Methodists, who abound most in the southern and western states, have about 2000 congregations, and display a very active proselyting spirit. The Presbyterians, whose principal strength lies in the middle states, have about 900 congregations, which are classed into presbyteries and synods. The Associate Reformed, or American Burghers, have about 100 churches, and the Associate Synod, or Antiburghers, about 50; but there is a tendency in both these sects to coalesce with the Presbyterians. The Dutch Reformed Church, confined to New-York and New-Jersey, has about 200 churches. The Episcopalians had 600 churches, and 346

^a Warden, III. 402.

^b Niles' Register, 30th March, 1822.

^c The same rule held in Connecticut until it was abolished by the new Constitution in 1818.

^d See the triumphant reply of Dwight to an English writer, on the supposed ruinous state of religion in New-England. Dwight's Travels, vol. iv. 430.

^e Morse, vol. i. 368.

clergymen, in 1822,^a chiefly in the middle and southern states. They are governed by a convocation, consisting of two houses. The Catholics, who are not numerous any where but in Maryland, are estimated by Dr. Morse to amount to 75,000. The Quakers have about 190 congregations, chiefly in the middle states. The Moravians, Universalists, Mennonists, Cameronians, and other sects, have each a few churches; and the Jews have synagogues at New-York, Newport, Philadelphia, Charlestown, and Savannah. The whole number of churches, or religious societies, in the United States, is probably not under 9000, or one for each 1100 inhabitants.

The duties of a clergyman in the United States, are laborious and incessant; the pay arises from pew rents, and voluntary contributions, sometimes from small glebes, fixed funds, or land. It is seldom so large as to prove a temptation to the worldly-minded; but when a congregation is numerous, it is generally sufficient to support the clergyman respectably. In populous towns it is from 2000 to 4000 dollars, (450 to 900*l.*;) but in country places it is greatly lower, and is sometimes paid in kind, or raised by penny-a-week associations. A gratuity varying from five to twenty dollars, is usually presented to the clergyman at a marriage. For these slender emoluments, the Americans secure the services of a body of moral, faithful, diligent, and often well-educated clergymen, among whom, fox-hunting and sinecures, and non-residence, are unknown. Missionary and Bible Societies, and religious institutions of all kinds, are fully more numerous than in Britain in proportion to the population. The Sabbath in some places is kept from sun-set on Saturday to sun-set on Sunday.^b

There are about thirty colleges or universities in the United States, of which Harvard and Yale are the most celebrated; but most of these are less perfect than the kindred establishments in Europe; and classical and scientific education is generally in a much lower state. Harvard university in Massachusetts, has fifteen literary and six medical professors, and generally from 300 to 400 students. The three terms amount to nine months in the year, and the vacations to three; the academical course is completed in four years, and the expense of a student's board and education is about 500 dollars (110*l.*) a-year, on the lowest scale. Among the theologians of this university, Socinianism is almost universally prevalent. Yale college in Connecticut is less richly endowed than Harvard, but enjoys an equal reputation. The faculty consists of a president, nine professors, four medical examiners, and six tutors. The students, except those whose parents live in the town, board within the college. At this seminary, the advantages of the English and Scotch systems are to a considerable extent combined. The scope for original discussion, and elegance of illustration which lecturing affords, is connected with the more laborious and effective discipline of tutors and examinations; the students are not considered as passive recipients of knowledge, but

are stimulated to the active exercise of their own powers. All the classes are subjected to a rigorous examination twice a year; and those examinations, with the numerous exercises prescribed, and the severe discipline enforced, drive away the laggard and disorderly members, and insure a respectable proficiency in those who receive degrees at the end of the fourth year. This college had 412 students in 1820. Most of the other universities and colleges are organized on the same principles.^c

Public provision to a less or greater extent, is made in almost all the states for the support of common schools. In the old states, funds have been set apart for this purpose from time to time out of the public taxes or property. In the new states, one square mile in every township, or one *thirty-sixth* part of all the lands, has been devoted to the support of common schools, besides seven entire townships for the endowment of larger seminaries. Throughout New-England, the means of education are generally ample; and a grown person unable to read and write, can scarcely be found. In the southern states, where they were more deficient, a zealous attention to the subject has been lately awakened; and families in sequestered situations unite to procure teachers for the children at a great expense.^d But no state in the Union, and no country in the world, is so amply provided with the means of elementary instruction as the state of New-York; in which there were, in 1823, no less than 7382 common schools, affording education to 400,534 young persons, which rather exceeds the fourth part of the whole population.^e In the middle and eastern states, the people are more universally educated, at present, than in any other part of the world; and there is every probability, that the western and southern states will soon share in the same distinction. It is to this circumstance, to the superior degree of comfort the people enjoy, and to the elevation of character nourished by their republican institutions, that we must attribute the non-existence of any class in the United States to which the term mob, populace, or rabble, can be applied.^f

The growth of a native literature in the United States has been impeded by several causes. First, the number of well educated persons living in idleness, who cultivate taste, and encourage its cultivation in others, is comparatively small. Secondly, the universal addiction to gainful pursuits, and the striking success which repays them; disheartens persons from engaging in occupations that do not fill the pocket. But thirdly, by far the greatest impediment is the existence of the more advanced literature of England, in the very language of the country. Though the political connexion has ceased, the United States, in what regards literature, are nearly as much a province of Britain as Yorkshire or Ireland. So long as British writers furnish the standard by which transatlantic works are tried, native American writers will not receive justice; and while American publishers can import and reprint,

^a Niles' Register, 1822.

^b For the state of religion in North America, see Morse, I. 206. Warden, chap. 49. Duncan's Travels, (1823) Letter 20. Hodgson, Letters from North America, II. 212—230, and passim; and Dwight's Travels, IV. 309—456.

^d Hodgson's Letters, I. 387.

^e In all the New-England states, except Rhode Island, the education of the entire population is provided for by law. The towns and townships are divided into districts, in which schools are supported, for at least a certain part of the year, by public funds or taxes; and in Massachusetts all

MSL. II.—NOS. 79 & 80.

towns, of at least 5000 inhabitants, are required to support a school for Greek and Latin. The state of Connecticut has a public fund, derived from the sale of lands in the western reserve (Ohio,) of which the nominal capital, April 1, 1828, amounted to \$1,877,615—the largest fund, in proportion to the population, for the purposes of general education, now in existence. In 1820, when the population of Connecticut was 275,000, the number of children, between the ages of 4 and 10, who were entitled to receive the benefits of this fund, was 84,173, or nearly one third of the whole population. In 1827, it was 85,147.—P.

^f Warden, chap. 48. Morse, passim. Walsh's Appeal, (1819) p. 297.

without risk or expense, works already stamped with the approbation of British critics, and the British public, they will feel the less inclined to engage in the doubtful and hazardous speculation of publishing the original products of American genius. Besides, the appetite for knowledge, and the sort of amusement which reading affords, like the desire for clothes and luxuries, requires a certain, and only a certain supply; and in the one case, as in the other, when the article can be cheaply imported, the native manufacture is discouraged. America, however, is rapidly acquiring a literature of her own, and the productions of her press already begin to attract attention in Europe.

In one department of literature, of a humble indeed, but a most useful description, the United States stand unrivalled. We allude to their Newspaper press. There were but seven papers published in the United States in 1750;^a but in 1810 there were 359, (including twenty-five published daily,) which circulated 22,200,000 copies in the year. In 1823 they had increased to the astonishing number of 593, according to the following table, published in New-York.

Periodical Press of the United States in 1823.

In Maine	12	Georgia	14
New-Hampshire	11	Ohio	48
Massachusetts	35	Indiana	12
Rhode Island	9	Illinois	5
Connecticut	23	Missouri	6
Vermont	8	Kentucky	18
New-York	137	Tennessee	15
New-Jersey	18	Mississippi	7
Pennsylvania	110	Alabama	10
Delaware	4	Louisiana	8
Maryland	22	Michigan	1
Virginia	35	District of Columbia	8
North Carolina	10		
South Carolina	12		
		Total	593

The number of copies circulated in the year, by these journals, probably exceeds 30,000,000. In the British

^a Dwight's Travels, IV. 345.

isles in 1821, with twenty millions of people, the number of newspapers was estimated to be 284, and the copies printed annually 23,600,000.^b The whole of continental Europe, containing 160 millions of inhabitants, where the press is chained down by royal and priestly jealousy, certainly does not support half the number of journals which exist in the United States alone. They are superficial observers, who attach a small importance to this humble branch of literature. Though none of the American papers equal the best of those published in London, the periodical press of the United States, taken altogether, is the most powerful engine for diffusing mercantile, political, and general information, for stimulating the activity, and operating on the minds and morals of the people, which has ever existed in any country. No duty is paid, either on the papers themselves, or on the advertisements they publish. The price of a weekly paper is about two dollars per annum, or twopence each number; that of a daily paper from eight to ten dollars, or one penny halfpenny each number. A single paper sent by post pays one cent (a halfpenny) for any distance under 100 miles, and a cent and a half for all greater distances; and pamphlets may be transmitted by post at the same expense.

The following are the dates of a few of the principal events in the history of the United States.

1607.	First settlement made by the English.
1776.	July 4. The independence of the United States proclaimed.
1782.	Nov. 30. Peace concluded with Great Britain.
1787.	Sept. 17. Federal constitution framed.
1789.	March 4. Inauguration of George Washington as president.
1797.	John Adams as president.
1801.	Thomas Jefferson as president.
1809.	James Madison as president.
1812.	June 18. War declared against Britain.
1814.	Dec. 24. Peace concluded.
1817.	March 4. Inauguration of James Monroe as president.
1825.	John Q. Adams as president.
1829.	Andrew Jackson as president.

^b Lord John Russel's Speech on Reform, April, 1822, p. 42.

	1,990,296,961	1,631,657,224	619,977,247		

Louisiana is not included in the above table, the returns being incomplete.

TABLE

Of Manufactures of the United States, according to Returns made to the Marshals in 1810.

The value as distributed among the states was as follows :

Maine, - - -	2,138,000	North Carolina, - - -	5,323,000
New-Hampshire, - - -	8,135,000	Tennessee, - - -	3,708,000
Vermont, - - -	4,325,000	South Carolina, - - -	2,174,000
Massachusetts, - - -	17,516,000	Georgia, - - -	2,744,000
Rhode Island, - - -	3,080,000	Mississippi Territory	314,000
Connecticut, - - -	5,901,000	Orleans Territory, - - -	814,000
New-York, - - -	14,569,000	Louisiana Territory, - - -	35,000
New-Jersey, - - -	4,703,000	Indiana Territory, - - -	197,070
Pennsylvania, - - -	32,089,000	Illinois Territory, - - -	72,000
Delaware, - - -	990,000	Michigan Territory, - - -	37,000
Maryland, - - -	6,554,000	Columbia District, - - -	719,000
Virginia, - - -	11,447,000		
Ohio, - - -	1,987,000	Total—dollars	133,692,070 †
Kentucky, - - -	4,121,000		

The following are the most prominent particulars :

Goods manufactured by the loom, - - - - -	39,500,000
Machinery of various kinds, - - - - -	6,100,000
Hats, - - - - -	4,300,000
Iron manufactures, - - - - -	14,360,000
Leather, - - - - -	17,900,000
Distilled and fermented liquors, - - - - -	16,530,000
Wooden manufactures, - - - - -	5,540,000

* As the value of slaves is different in different states, and the number of slaves valued cannot be ascertained from the returns of the assessors, the value of houses and lands in most of the slave holding states cannot be ascertained with precision. It is believed that the valuations made in most of the states, and particularly those in the south, in 1799, were considerably under the real value.

† In this calculation the number of acres is taken from the returns of land, valued in each state in 1799, the returns of the quantity of lands valued in 1814 and 1815 being in some of the states incomplete. (Pitkin, p. 373.)

‡ Mr. Tench Coxe, Secretary to the Treasury, showed that, allowing for short returns and imperfect returns, the true amount should be about 172,762,676 dollars.

Cotton of Domestic Growth, Exported from 1805 to 1817.

Years.	Sea Island.	Upland.	Value.
	Pounds.	Pounds.	Dollars.
1805	8,787,659	29,602,428	9,445,000

BOOK LXXXIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Mexico, comprising New Mexico and the Captain-Generalship of Guatemala.—General Physical Description.

WE are now about to survey, in succession, the vast possessions of the Spanish nation, or their revolted descendants, in the two Americas;—possessions comprehended between lat. $43^{\circ} 34'$ south, and $37^{\circ} 48'$ north,^a which equal in length the whole of Africa, and surpass in extent the immense countries in Asia that acknowledge the dominion of Great Britain and Russia. The missionary establishment of San Francisco, on the coast of New California, forms the most northerly point; and the most southern extremity inhabited by the Spaniards is Fort Maullin, on the coast of Chili, opposite to Chiloe; for the establishment of the port of Soledad, situated eight degrees more to the south, in the group of the Malouine or Falkland islands, whither the criminals, condemned at Monte-Video, are annually transported, cannot be looked upon as a permanent settlement, since it is not permitted to send women thither. Some families of Spanish descent, nevertheless, are still to be met with in the island of Caylin, or Quilan, in $43^{\circ} 34'$ of south latitude. The Spanish language, then, is diffused in America over an extent of country more than a thousand leagues in length; and the whole of these regions, peopled by more than thirteen millions of inhabitants,^b communicated with each other, previously to the late troubles, by a regular establishment of posts, extending from Paraguay to the north-west coast of North America.

This transatlantic Spain, far more interesting in many points of view than its European metropolis, will supply us with abundant materials for an historical and political description, which, however, ought first of all to be preceded by a physical and topographical account of the great divisions of which it is composed.

But, amongst these very complicated, and very confused divisions, which ought we to adopt? In a military and executive point of view, the dominions of the king of Spain in America were formerly divided into nine great governments, which might be considered as independent of each other, and which, within the last twelve years,^c have actually resolved themselves into separate states, of different forms of government, and totally independent of each other, or of the mother country. Their topography, however, can only be comprehended by employing the subdivisions and limits anciently prescribed. Of these divisions, five, namely, the vice-royalties of Peru and of New Grenada, and the captain-generalships of Guatemala, Porto Rico, and the Caraccas, are completely situated within the tor-

rid zone; the four others, namely, the viceroyalties of Mexico and Buenos Ayres, as well as the captain-generalships of Chili and the Havannah,^d which comprehended the Floridas, are partly situated without the two tropics. As the geographical latitude, however, exerts infinitely less influence over the fertility and productions of these beautiful countries than the elevation of the soil, a division, founded on the degrees of latitude, would afford no advantage to physical geography. If we merely distinguish the great masses of land, circumscribed by seas, included in the basins of rivers, or marked by some other striking feature, we shall classify the continental regions of Spanish America into three divisions; that of the north, comprising Mexico with Guatemala; the middle division, including Peru, New Grenada, and Caraccas; and, finally, that of the south, containing Paraguay, or Buenos Ayres, Chili, and the Magellanic regions. The islands of Porto Rico and Cuba will be described with the rest of the Columbian Archipelago. Florida has already been considered along with the United States.

Custom has extended to all the Spanish provinces to the north of the Isthmus, Florida excepted, the general appellation of Mexico, although, strictly speaking, these countries have no common name applicable to them all. The term *New Spain* was applied at first, in 1518, only to the province of Yucatan, where the cultivation of the fields, and the beauty of the edifices, excited the admiration of the military followers of Grijalva. Already, in 1520, Cortez extended the denomination of New Spain to the kingdom of *Montezuma*, at the same time, advising Charles V. to assume the title of Emperor. According to the researches of the Abbe Clavigero, this kingdom, which, on the authority of Solis, stretched from Panama to New California, was bounded on the eastern coasts by the rivers Guasacualco and Tulpan, and on the western, by the plains of Soconusco, and by the port of Zacatula. It thus embraced the present intendancies of Vera Cruz, Oaxaca, Puebla, Mexico, and Valladolid, with a surface of eighteen or twenty thousand square leagues. Even the name of Mexico is of Indian origin. It signifies, in the Aztec language, the habitation of the god of war, called Mexitli, or Huitzilpochtli. It appears, nevertheless, that before the year 1530, the city was more commonly denominated *Tenochtitlan*. The appellation *Anahuac*, which must not be confounded with the preceding names, designated, before the conquest, all the tract of country contained between the fourteenth and twenty-first degrees of latitude. Independently of the Aztec empire of Mon-

^a The N. boundary of Mexico, or that between the late Spanish territories and the U. States, W. of the Rocky Mountains, is in 42° N.—P.

tezuma, the little republics of Tlaxcallan, or Tlascala, and of Cholollan, or Cholula, the kingdom of Tezcuco, or Acolhoacan, and that of Mechoacan, which comprehended a part of the intendency of Valladolid, belonged to the plateau, or table land, of the ancient Anahuac.^a

The vast expanse of country over which the Viceroy of Mexico exercised his supreme military power, which is designated, in general, under the name of *New Spain*, and is contained within the parallels of the thirty-eighth^b and tenth degrees of north latitude, included two great distinct governments: 1. The captain-generalship of *Guatemala*, which comprehended the governments of Costa Rica and Nicaragua, with the provinces of Honduras, Vera Paz, Chiapa, and Guatemala; 2. The viceroyalty of *Mexico*, or of New Spain properly so called, comprising Mexico proper, and the eastern and western interior provinces, or *provincias internas*.^c The captain-general of Guatemala, considered as a governor, having been only slightly subordinate to the Viceroy of New Spain, M. Humboldt separates Guatemala from Mexico; of which, in that case, the southern limits touch the shores of the great ocean, to the east of the port of Tehuantepec, near to the bar of Tonalá, and extend to the coasts of the Caribbean sea, near the bay of Honduras.

Exclusively of Guatemala, the kingdom of New Spain extends from the sixteenth to the thirty-eighth degree of latitude, over a space of 610 leagues in length, in a direction from south-east to north-west. The breadth, which, under the thirtieth parallel, from the Red River (*Rio Colorado*) in the province of Texas, to the island of Tiburon, on the coasts of the intendency of Sonora, is 364 leagues, goes on continually decreasing to the isthmus of Tehuantepec, where it is only forty-five leagues from sea to sea.

The limits of New Spain to the north and east are abundantly vague, and difficult to determine. So late as 1770, the Cardinal Lorenzana asserted, in a work published at Mexico, that New Spain, in the remotest confines of the bishopric of Durango, perhaps bordered on Tartary and Greenland; namely, by the Californias on Tartary, and by New Mexico on Greenland.^d For a long time the Viceroys of Mexico looked upon the whole north-west coast of America as a dependency of their government, and even very recently directed an official visit to be made to the Russian colonies of the peninsula of Alaska. The English establishment at Nootka Sound, still more closely approaching the Spanish colonies, led to strong remonstrances. Nevertheless, after a great deal of discussion, the court of Madrid appeared to find its advantage in leaving unmolested this barrier against the invasions of Russia in that direction, by adopting Cape Mendocino, to the north of St. Francisco, as the definitive boundary. Nothing, however, has yet been able to secure Spain against the enterprising spirit of the United States, which seem desirous of embracing the whole of North America in their confederation. Since the acquisition of Louisiana, the inhabitants of these new republics actively press forward their civilization towards the Missouri, and approach the

shores of the great ocean by the beautiful river Columbia. To the east, the maps published in the United States mark the river Sabine as the boundary; but the Congress at Washington openly endeavours to confine this limit of Mexico to the basin of the Rio Bravo del Norte.^{e f}

Since the new administration, introduced in 1776 by Don Galvez, minister of the Indies, New Spain has been divided into twelve intendancies, and three provinces.^{g h}

Of these fifteen divisions there are:

A. In the interior, to the north,

1. The province of *New Mexico*, extending along the Rio del Norte.

2. The intendency of *New Biscay*, to the south-west of the Rio del Norte, upon the central plateau.

B. Upon the great Pacific Ocean, to the north-west,

3. The province of *New California*;

4. The province of *Old California*;

5. The intendency of *Sonora*.

C. Towards the Gulf of Mexico, to the north-east,

6. The intendency of *San Luis Potosi*, comprising the provinces of *Texas and Cohahuila*, the colony of New Santander, the new kingdom of Leon, and, finally, the districts of Charcas, Altamira, Catorce, and Ramos, which compose the intendency of San Luis, properly so called.

These six territories, almost entirely included in the temperate zone, contain a total of 677,000 souls, in an extent of 82,000 square leagues; which gives a proportion of eight inhabitants to a square league.

To the south of the tropic we find,

D. in the middle region,

7. The intendency of *Zacatecas*;

8. ————— of *Guadalajara*;

9. ————— of *Guanaxuato*;

10. ————— of *Valladolid*;

11. ————— of *Mexico*;

12. ————— of *Puebla*;

13. ————— of *Vera Cruz*;

E. At the south-eastern extremity,

14. The intendency of *Oaxaca*;

15. That of *Merida* or *Yucatan*.

These nine intendancies, situated under the torrid zone, contain a population of 5,160,000 souls, dispersed over a surface of 36,500 square leagues, or 141 inhabitants to every square league. But four-fifths of this population are concentrated upon the ridge of the Cordillera, or on plateaus, the elevation of which above the sea equals in height the pass of Mount Cenis.

According to the ancient division, still very much in use in the country, New Spain formed, 1. *The kingdom of Mexico*; 2. *The kingdom of New Galicia*; 3. *The new kingdom of Leon*; 4. *The colony of New Santander*; 5. *The province of Texas*; 6. *The province of Cohahuila*; 7. *The province of New Biscay*; 8. *The province of Sonora*; 9. *The province of New Mexico*; 10. *The two Californias, or the provinces of Old and New California*.

The kingdom of Mexico embraced the present intendancies of Guanaxuato, Valladolid, or Mechoacan, Mexico,

trapezium of 47,469 square leagues. Humboldt's Map of New Spain, in Tab. Pol.

^d Ibid. t. II. p. 84.

^e 485 miles of coast to the south. It enters the gulf in a south-east direction; Sabine River in a course directly south; thus leaving a disputed

Puebla, Vera-Cruz, Oaxaca, and Merida, with a portion of the intendency of San Luis Potosi: it consisted, therefore, of more than 27,000 square leagues, and contained nearly 4,500,000 inhabitants. The kingdom of New Galicia extended over more than 14,000 square leagues, and its population consisted of nearly a million of inhabitants. It comprised the intendancies of Zacatecas, and Guadalajara, as well as a small part of that of San Luis Potosi.^a

Another division equally ancient, is that which distinguishes *New Spain*, properly so called, from the *provincias internas*; that is to say, those provinces situated in the interior of the continent, although, with regard to the capital, they are exterior. To the latter belong all that is to the north and north-west of the kingdom of New Galicia, except the two Californias, consequently, the little kingdom of Leon, the colony of New Santander, Texas, New Biscay, Sonora, Cohahuila, and New Mexico. The "*provincias internas del Vireynato*,"^b which comprise 7814 square leagues, are distinguished from the "*provincias internas de la comandancia de Chihuahua*,"^c erected into captain-generalships in 1779. These latter contain 53,375 square leagues. Of the twelve new intendancies, there are three situated in the internal provinces; namely, those of Durango, Sonora, and San Luis Potosi. It must be remarked, nevertheless, that the intendant of San Luis is not directly subject to the Viceroy, except for Leon, Santander, and the districts of Charcas, Catorce, and Altamira, in the vicinity of his residence. The governments of Cohahuila, and of Texas, also form a part of the intendency of San Luis Potosi, but they appertain directly to the "*comandancia general*"^d of Chihuahua.

From this it results that the whole of New Spain is divided into,

A, provinces subject to the Viceroy of New Spain, containing 59,103 square leagues, with 5,477,900 inhabitants, and comprehending the two Californias, and the intendancies of Mexico, Puebla, Vera Cruz, Oaxaca, Merida, Valladolid, Guadalajara, Zacatecas, Guanajuato, and San Luis Potosi, with the exception of Cohahuila, and Texas.

B, into provinces subject to the commandant-general of the internal provinces, comprehending a space of 59,375 square leagues, and containing a population of 359,200 inhabitants, and comprehending the intendancies of Durango, and Sonora, and the provinces of New Mexico, Cohahuila, and Texas.

The grand total is 118,478 square leagues, and 5,837,100 inhabitants.^e In consequence of recent contests with the United States of America, the systematic encroachments of which had given just alarm to Spain, the military government of the internal provinces, before this period intrusted to the governor of Chihuahua, had been confided to two commandants-general. The western internal provinces, namely, Sonora, Durango, or New Biscay, New Mexico, and the Californias, were then distinguished from the eastern internal provinces; that is to say, from Cohahuila, Texas, the colony of New Santander, and the new kingdom of Leon. These new commandants-general, as

^a A. de Humboldt, t. II. p. 81, &c.

^c Internal provinces of the government of Chihuahua.

^d General government.

^e Or rather was so in 1805; at present they exceed 8,000,000, as will appear in the following book.

^f The total of the population in the table is 6,174,200. The above remark on the total population is not found in the original.—P.

well as the former one, were considered as chiefs of the administration of finances in the two intendancies of Sonora and Durango, and in the provinces of New Mexico, Texas, and Cohahuila. With regard to Leon, and New Santander, they depended on the commandant no farther than what regarded the military defence.

The present troubles have, in part, overturned these administrative divisions; but it is still indispensable, as we have said, to be acquainted with the former complicated arrangement.

The following table indicates, in a more particular manner, the distribution of the population, and the very unequal proportion which it bore with the superficial extent of the intendancies, when the total was 5,837,100.^f Each of the estimates must now be increased in the ratio of 5,837,100 to 8,000,000.^g

Extent in Square Leagues.		Population.		Inhabitants per Square League.	
San Luis Potosi	27,821	Mexico ^b	1,911,800	Guanajuato . . .	568

Casting a general glance over the whole surface of Mexico, we find that two-thirds of it are situated under the temperate, and the remaining third under the torrid zone. The first part comprehends a surface of 82,000 square leagues. It includes the *provincias internas*; not only those that are subject to the immediate administration of the viceroy of Mexico, such as the new kingdom of Leon, and the province of New Santander; but also those governed by a particular commandant-general,¹ such as the intendancies of Durango and of Sonora, and the provinces of Cohahuila, Texas, and New Mexico.^m On the one hand, small portions of the northern provinces of Sonora, and of New Santander, pass beyond the tropic of Cancer; and on the other, the southern intendancies of Guadalajara, Zacatecas, and San Luis de Potosi, extend a little to the north of this boundary. Nevertheless, in consequence of a concurrence of various causes, and local circumstances, more than three fifths of the 36,000 square leagues, situated under the torrid zone, enjoy a cold or moderate temperature, rather than a burning heat. The whole interior of the viceroyalty of Mexico, especially the interior of the country comprised under the ancient denominations of Anahuac, and of Mechoacan, and in all probability, even the whole of New Biscay, form one immense elevated plateau, from 6500 to 8200 feetⁿ above the level of the neighbouring seas; while, on the contrary, in Europe, those elevated districts that present the appearance of plains, such as the plateaus of Auvergne, Switzerland, and Spain, scarcely rise higher than from 1300 to 2600 feet^o above the ocean.

^g That is, on the supposition that the increase has been equal in all the intendancies.—P.

^o "400 to 800 metres."

The chain of mountains that forms the plateau of Mexico, appears, on the slightest inspection of a geographical map, to be precisely the same which, under the name of the Andes, traverses the whole of South America. When examined, nevertheless, in a physico-geographical point of view, the structure of this chain differs very much to the south and north of the equator. In the southern hemisphere, the Cordillera is every where cleft and interrupted by crevices, that resemble open veins, which could not be filled up by heterogeneous substances. If elevated plains be met with, as in the kingdom of Quito, and the parish of Pastos, they ought rather to be considered as high longitudinal valleys, bounded by two branches of the great Cordillera of the Andes. In Mexico, it is the ridge itself of the mountains that constitutes the plateau. In Peru, the highest peaks approach to form the central summit of the Andes.^a In Mexico, these same peaks now become of less colossal dimensions, but still from 16,000 feet to 17,700 feet^b in height, are either scattered over the plateau, or ranged in lines, which bear no relation of parallelism to the general direction of the Cordillera. In Peru, and in the kingdom of New Grenada, numerous transverse valleys, of which the perpendicular depth is sometimes 4600 feet,^c prevent the inhabitants from travelling in any other manner than on horseback, or on foot, or being carried on the backs of the Indians. In the kingdom of New Spain, on the contrary, carriages roll, without obstruction, from the capital of Mexico to Santa-Fé, a distance of above 500 leagues.

The length of the table-land, comprehended between the latitudes of 18° and 40°, is equal to the meridional distance of Lyons from the tropic of Cancer, a line which crosses the great desert of Africa. This extraordinary plateau appears insensibly to decline towards the north, especially from the town of Durango, situated in New-Biscay, at 140 leagues from Mexico. This slope, contrary to the direction of the rivers, would certainly appear very improbable, if it were not admitted by the learned and judicious traveller, to whom we are indebted for almost every thing precise, exact, and interesting, respecting these countries. We must take for granted, therefore, that the mountains to the north of Santa-Fé, rise abruptly to form the very elevated ridges and table-lands, from which descend the Missouri and its tributary streams.

Of the four plateaus situated round the capital of Mexico, the first, which comprehends the valley of Toluca, is 8530 feet in height;^d the second, or the valley of Tenochtitlan, is 7460 feet;^e the third, or the valley of Actopan, 6553 feet;^f and the fourth, or the valley of Istla, is elevated 3343 feet.^g These four basons differ as much from each other in climate, as in elevation above the level of the ocean. Each of them is adapted to a different species of cultivation. The last, and least elevated, is suitable for the growth of the sugar-cane; the third, for that of cotton; the second, for producing the wheat of Europe; and, on the first, there are plantations of agaves,^h which may be considered as the vineyards of the Aztec Indians.

If this configuration of the surface singularly favours, in

the interior of New Spain, the conveyance of merchandise, navigation, and even the construction of canals, nature opposes great difficulties to the communication between the interior of the kingdom and the coasts, which, rising from the sea in the form of a rampart, every where present an enormous difference of level, and of temperature. The eastern declivity, more especially, is rapid, and of difficult access. In travelling from the capital to Vera Cruz, it is necessary to proceed sixty nautical leagues before a valley can be met with, of which the bottom is lower than 3281 feetⁱ above the level of the sea. Of the eighty-four leagues that are reckoned from Mexico to this port, fifty-six are occupied by the great plateau of Anahuac; the remainder of the road is nothing but one continued and painful descent. It is the difficulty of this descent that renders the conveyance of the flour of Mexico to Vera Cruz so expensive, and prevents it from rivalling, in Europe, the flour of Philadelphia. In the road to Acapulco, on the great ocean, the traveller reaches the temperate regions in less than seventeen leagues distance; after which, he has incessantly to ascend and descend as far as the sea.

The Cordillera of the Andes, which traverses the Isthmus of Darien, at one time approaches the Pacific Ocean, at another, the coasts of the Gulf of Mexico. In the kingdom of Guatemala, the crest of these mountains, bristling with volcanic cones, stretches along the western coast from the lake of Nicaragua as far as the bay of Tehuantepec; but, in the province of Oaxaca, between the sources of the rivers Chimalapa and Quatarnalco, it occupies the centre of the Mexican isthmus. Between the 18½° and 21° of latitude, in the intendancies of Puebla and Mexico, from Mixteca to the mines of Zimapan, the Cordillera runs from south to north, and approaches the eastern coast. It is in this part of the great plateau of Anahuac, between the capital of Mexico and the little towns of Cordova and Xalapa, that a group of volcanic mountains appear, which rival in elevation the highest peaks of the continent. Humboldt measured the principal ones. *Popoca-Tepell*, that is to say, the Smoking Mountain, called by the Spaniards the great volcano,^k is 2764 toises, or 17,968 English feet in height; the *Iztacci-Huall*, or the White Woman, the *Sierra Nevada* of the Spaniards, is 2461 toises, or 16,000 feet; the *Cittal-Tepell*, or Starry Mountain, otherwise called the *Peak of Orizaba*, is 2722 toises, or 17,697 feet; the *Nevalo de Toluca* is 2364 toises; and the *Nauhcampa-Tepell*,^l or *Cofre de Perote*, is 2097 toises,^m or 13,633 English feet.

More to the north of the nineteenth parallel, near the celebrated mines of *Zimapan* and *Doctor*, situated in the intendancy of Mexico, the Cordillera takes the name of *Sierra Madre*, in Mexican *Tepe-Suene*. Again leaving behind it the eastern part of the kingdom, it runs to the north-west, towards the towns of San Miguel el Grande and Guanajuato. To the north of this last town, considered as the Potosi of Mexico, the Sierra Madre expands to an extraordinary breadth, and shortly afterwards dividing into three branches, the most eastern one of which proceeds towards Charcas, and Real de Catorce, to lose itself

In the new kingdom of Leon; the western branch occupies a part of the intendency of Guadalajara. From *Bolunos* it sinks rapidly, and is extended, by Culiacan and Arispe, into the intendency of Sonora, as far as the banks of the Rio Gila. Under the thirtieth degree of latitude, however, it again acquires a considerable height in Tarahumara, near the Gulf of California, where it forms the mountains of *Pimeria Alta*, celebrated for considerable washings of gold. The third branch of the Sierra Madre, which may be looked upon as the central chain of the Mexican Andes, occupies the whole extent of the intendency of Zacatecas. It may be traced by Durango and Parral in New Biscay to the *Sierra de los Mimbres*, situated to the west of Rio Grande del Norte; and from thence it traverses New Mexico, and joins the mountains of *Las Grullas*, and the *Sierra Verde*. This mountainous country, situated under the fortieth degree of latitude, was examined, in 1777, by the Fathers Escalante and Fond. It gives rise to the Rio Gila, the sources of which approach those of the Rio del Norte. It is the crest of this central branch of the Sierra Madre which divides the waters between the Great Ocean and the sea of the Antilles. It is this of which Fidler and the intrepid Mackenzie examined the continuation, under 50° and 55° of north latitude. The map of Don Alzate^a gives the particular name of *Sierra dos Pedernales*, or the Mountain of Gun-Flints, to a part of the Sierra de Mimbres, a circumstance which seems to indicate a resemblance between the rocks of this chain and those of the Rocky Mountains.

The granite, which here appears to form, as it does every where else, the lowest stratum, appears at the surface in the little chain that borders the Pacific Ocean, and which, towards Acapulco, is separated from the mass of high country by the valley of Peregrino.^b The beautiful port of Acapulco is excavated, by the hand of nature, in granitic rocks. The same rock forms the mountains of Mixteca and of Zapoteca, in the intendency of Oaxaca.^c The central plateau, or Anahuac, appears like an enormous dike of porphyritic rocks, distinguished from those of Europe by the constant presence of hornblend, and by the absence of quartz. They contain immense deposits of gold and silver. Basalt, amygdaloid, gypsum, and Jura limestone,^d form the other predominant rocks. The strata succeed each other here in the same order as in Europe, except that sienite alternates with serpentine. The secondary rocks equally resemble those of our European countries; but, hitherto, no considerable beds of rock-salt or of coal have been discovered on the plateau of Mexico, while, on the contrary, these substances, especially the former, appear to exist in great abundance to the north of the Gulf of California, near the Lake Timpanogos.^e

The porphyry of the Sierra de Santa Rosa appears in gigantic masses, which assume extraordinary shapes, imitating the appearance of ruined walls and bastions. The masses which rise perpendicularly, and are elevated 1000 or 1300 feet^f above the surrounding plains, are called in the country *buffa*. Enormous balls, composed of concentric layers, rest on isolated rocks. These porphyries give the environs of the town of Guanajuato a singularly

romantic aspect. The porphyritic rock of Mamancheta, known in the country by the name of *los Organos de Actopan*, rises to the view in the horizon like an old tower, of which the shattered base has become narrower than the summit.^g The porphyritic traps^h in columns, which terminate the mountain of Jacal and Oyamel, are crowned with pine trees and oaks, which add a certain picturesque gracefulness to this imposing sight.ⁱ It is from these mountains that the ancient Mexicans obtained the *Itzli* or Obsidian, of which they formed their cutting instruments.

The *Cofre de Perote* is a porphyritic mountain, elevated 13,633 feet above the level of the sea, and represents an ancient sarcophagus, surmounted by a pyramid at one of its extremities.^k The basalts of La Regla, of which the prismatic columns, nine hundred and sixty-seven feet^l in height, have their central parts harder than the rest, form the native decorations of a very beautiful cascade.^m

The inhabitants of Mexico scarcely look upon volcanoes as a curiosity, so familiar are they with the effects of these colossal furnaces. Almost all the summits of the American Cordilleras contain craters. That of *Popoca-Tepetl* is said to be half a league in circumference; but, at present, it is inaccessible. The *Peak of Orizaba* is also a volcano, from which, in 1545, an eruption took place, and which continued burning for twenty years. This mountain is called by the Indians *Cital-Tepetl*, or the Starry Mountain, on account of the luminous exhalations which rise from its crater, and play round its summit, which is covered with eternal snow. The sides of these colossal cones, adorned with magnificent forests of cedar and pine, are no longer overwhelmed by eruptions, nor furrowed by torrents of burning lava. It even appears that currents of lava, properly so called, do not abound in Mexico. Nevertheless, in 1759, the plains of Jorullo, on the shores of the Pacific Ocean, formed the scene of one of the most tremendous catastrophes that the surface of the globe has ever experienced. In one single night, there issued from the earth a volcano of 1494 feet in height, surrounded by more than 2000 apertures, which still continue smoking to the present day. MM. Humboldt and Bonpland descended into the burning crater of the great volcano, no less than 258 feet in perpendicular depth, leaping over crevices which exhaled sulphuretted hydrogen in a state of combustion. After many dangers, on account of the fragility of the basaltic and sienitic lavas, they almost reached the bottom of the crater, where the air was, in an extraordinary degree, surcharged with carbonic acid.

The granitic mountains of Oaxaca do not contain any known volcano; but, more to the south, Guatemala was kept in a state of constant alarm by the vicinity of two mountains, one of which vomited fire, and the other water, and which ended at last by swallowing up this great city.ⁿ

The volcanoes continue as far as Nicaragua. Near this city is that of Momantombo. The *Omo-tepetl* shoots up its burning peak from the bosom of the lake of Nicaragua. Other volcanic mountains border the gulfs of the Pacific Ocean. The province of Costa Rica likewise contains volcanoes; and, amongst others, that of Varu, situated in the chain called Boruca.

ⁿ Lorenzana, cited in the Essay on Mexico, t. I. p. 171. (Fr.)

We will not terminate this sketch of the Mexican mountains, without speaking of its celebrated mines of gold and silver, of which the annual produce, even in ordinary times, amounts to fully 22,000,000 piastres, or 4,583,333 pounds sterling.^a The gold, which forms only one twenty-second part of the whole, is found in particles or grains, in the alluvial lands of Sonora, and Pimeria Alta. It also exists in veins, in the mountains of gneiss and micaceous schistus in the province of Oaxaca. The silver appears to affect the plateau of Anahuac, and of Mechoacan. The mine of Batopilas, in New Biscay, the most northerly that has yet been wrought, has afforded the greatest quantity of native silver; while, in the others, the metal is extracted from the ores which they call *meager*, such as red, black, muriated, and sulphuretted silver; or, from argentiferous lead ore. The want of mercury, which is procured from China and Austria, is the only thing that checks the spirit of mining. The mines already known, are far from giving any indication of being exhausted. Many, undoubtedly, are yet to be discovered. A Spaniard affirms that, in the province of Texas, all the stones contain silver.^b

The elevation at which nature has deposited her immense metallic riches in New Spain, is a source of remarkable advantage to the progress of national industry. In Peru, the most considerable mines of silver are found at an immense height, very near the limit of eternal snow. In order to work these mines, men, provisions, and cattle, must be brought from a distance. Towns, situated on elevated plains, where water freezes during the whole year, and where trees no longer grow, are not calculated to form a very attractive habitation. Nothing but the hope of acquiring riches could induce any man possessed of personal liberty, to abandon the delicious climate of the valleys, and voluntarily isolate himself on the summit of the Andes. In Mexico, on the contrary, the richest mines of silver, such as those of *Guanaxuato*, *Zacatecas*, *Tasco* and *Real del Monte*, are found at the moderate elevation of from 5530 to 6562 feet.^c There the mines are surrounded by cultivated land, towns, and villages; while forests crown the neighbouring heights, and every thing, in short, facilitates the exploring of their subterraneous riches.

In the midst of the numerous mountains which nature has granted to New Spain, it suffers, in general, like the parent country, from a want of water, and of navigable rivers. The great river *Rio Bravo del Norte*, and the *Rio Colorado*, are the only rivers that merit attention, both from the length of their course, and the great mass of water which they carry to the ocean; but flowing, as they do, in the most uncultivated part of the country, it will be long before they possess any interest with regard to commerce. In all the equinoctial part of Mexico, only small rivers are met with; but their estuaries are very broad. The narrow form of the continent prevents the union of a great body of water; while the rapid declivity of the Cordillera gives rise to torrents rather than rivers. Among the small number of rivers which are found in the southern part of the country, the only ones that may one day or other become interesting for the commerce of the interior,

are, the *Rio Huasacualco* and that of *Alvarado*, both of which are to the south-east of Vera Cruz, and are calculated to facilitate the communication with the kingdom of Guatemala; the *Rio de Montezuma*, which carries the waters of the lakes and valley of Tenochtitlan to the *Rio de Panuco*, and by which, forgetting the elevation of the ground, a line of navigation has been proposed between the capital and the eastern coast; the *Rio de Zacatula*; and, in fine, the great river *Santiago*, or *Tololotlan*, formed by the union of the rivers *Leorma* and *Las Laxas*, which might convey the flour of Salamanca, of Zelaya, and, perhaps, also, that of the whole intendency of Guadalupe, to the port of San Blas, on the shores of the Pacific Ocean.

The lakes with which Mexico abounds, and the greater part of which seem annually to diminish in size, are merely the remains of those immense basins of water that appear once to have existed on the lofty and extensive plains of the Cordillera. We may notice the great lake of Chapala, in New Galicia, which covers nearly one hundred and sixty square leagues of country; the lakes of the valley of Mexico, that occupy one fourth of the surface of that valley; the lake of Pazuaro, in the intendency of Valladolid, one of the most picturesque spots on the globe; and the lake of Mexitlan, and that of Parras, in New Biscay.

The Lake of *Nicaragua* merits very particular attention in consequence of its tides, and its position between the two oceans. It is probable that its position is very elevated,^d a circumstance that would render it extremely difficult, or even useless, to carry into execution the vague project of a canal of communication, which every one has been able to dream of, but which it was reserved for M. Martin de la Bastide to publish, under the triple form of a pamphlet, a fan, and a snuff-box! M. de la Bastide, however, has only forgotten three things: He does not give us the levels of the country between the lake and the gulf of Papagayo on the western coast; he does not point out the manner of rendering navigable the river St. John on the east, interrupted as it is by numerous falls of water; and he is not aware that, during the autumn, a pestilential atmosphere interdicts all approach to the mouth of this river. Generally speaking, all the various projects for opening a communication between the Atlantic and the Pacific Ocean, are attended with this inconvenience, that the canal would not admit vessels of the size that are required for the navigation of the open sea. It would become necessary, therefore, to unload and reload their cargoes, by which the benefits arising from a canal would be reduced almost to a level with the advantages which would result from a good road, communicating with two ports on their respective seas. In fact, a road would not have the same effect as a canal, in drawing the jealous attention, and exciting the hostile encroachments of foreign powers; a danger which appears to have formerly determined Spain to forbid, on pain of death, the renewal of any plan whatever for establishing such a communication.^e It appears, nevertheless, that new researches have been recently made respecting the most favourable points for constructing a canal of communication. The isthmus of Tehuantepec, to the south of Oaxaca, presents the two rivers of Huasa-

^e Alcedo, Dictionario Geografico de las Indias, at the words Istmo and Attrato.

caulco and of Chimalapa, which, united together by means of a canal of seven or eight leagues in length, would open a communication between the two oceans. The river Atrato, which falls into the Gulf of Darien, to the south-east of the Isthmus of Panama, is already united by a little canal, navigable for boats in the rainy season, to the *Rio San Juan*, a stream which empties itself into the Pacific Ocean. This, perhaps, is the very spot at which the chain of the Andes is the most completely interrupted, for the canal does not appear to be considerably elevated above the level of the two seas.^a

To complete the description of the Mexican territory, we must again cast a glance over the coasts and the seas by which they are washed. The whole of the eastern or Atlantic coast of New Spain ought to be looked upon as an immense dike or wall, against which the trade-winds, and the perpetual movement of the waters from east to west, heave up the sand which the agitated ocean holds suspended. The revolving current, proceeding from the southern Atlantic Ocean, first rolls past Brazil and Guyana, and then follows the coasts of Caraccas, from Cumana to Darien. It then flows toward Cape Catoche in Yucatan, and after long whirling in eddies in the Gulf of Mexico, it issues by the Bahama Channel or Gulf of Florida, and directs its course towards the Bank of Newfoundland. The sand accumulated by the eddying whirl of the waters from the Peninsula of Yucatan to the mouths of the Rio del Norte and the Mississippi, insensibly contracts the basin of the Gulf of Mexico, by adding to the breadth of the continent. The rivers that descend from the Sierra Madre to empty themselves into the sea of the Antilles, contribute not a little to fill up and elevate the bottom. The whole of the eastern coast of New Spain, from 18° to 26° of latitude, is obstructed by bars. Only vessels drawing little water^b can cross one of these bars without running the risk of touching. Nevertheless, these obstacles, so formidable to commerce, facilitate, at the same time, the defence of the country against the ambitious projects of a European conqueror.

Another very serious inconvenience is common both to the eastern and western coasts of the Isthmus. Violent storms render it almost impossible, during several months, to effect a landing, and thus prevent almost all navigation along these shores. The north-west winds, denominated *los nortes*, blow in the Gulf of Mexico from the autumnal to the vernal equinox. In September and October they are generally mild, and are at their greatest height in the month of March. On the western coast, the navigation is very dangerous in the months of July and August, dreadful tornadoes blowing at that time from the south-west. At this season, and even in September and October, the anchorage at San Blas, Acapulco, and all the ports of the kingdom of Guatemala, is exceedingly unsafe. During the favourable season, from October till May, the tranquillity of the ocean is again interrupted in these latitudes by the furious winds from the north-east and north-west, known by the names of *Papagayo* and *Tehuantepec*.

After this sketch of the general distribution of the surface, we perceive that the coasts of New Spain are almost the only part of it that enjoys a warm climate, so as to be

proper for supplying those productions which are the object of commerce with the Antilles. The intendancy of Vera Cruz, with the exception of the plateau which extends from Perote to the Peak of Orizaba, Yucatan, the coasts of Oaxaca, the maritime provinces of New Santander and Texas, the new kingdom of Leon, the province of Cohahuila, the uncultivated country called *Bolsón de Mampimi*, the coasts of California, the western part of Sonora, Cinaloa, and New Galicia, the southern borders of the intendancies of Valladolid, Mexico, and Puebla, are tracts of country which are low, and only interrupted by inconsiderable eminences. The mean annual temperature of these plains, as well as of the ravines that are situated under the tropics, and the elevation of which above the ocean does not exceed 967 feet, is from 77° to 79° of Fahrenheit's thermometer; that is to say, from 17° to 19° F.^d greater than the mean temperature of Naples.^e These fertile regions, denominated by the natives *Tierras Calientes*, that is to say, hot countries, produce sugar, indigo, cotton, and bananas, in abundance. When, however, Europeans, not accustomed to the climate, reside there for a long time, and when they assemble together in populous towns, these countries become subject to the yellow fever, known under the name of the black vomit, or *vomito prieto*. The port of Acapulco, and the valleys of Papagayo and Peregrino, may be classed among those portions of the globe where the air is constantly the hottest and most unhealthy. On the eastern coast of New Spain, the great heats are tempered for some time, when the north wind brings strata of cold air from Hudson's Bay, towards the parallels of the Havannah and Vera Cruz. These impetuous winds blow from the month of October to that of March. Very often they cool the air to such a degree that, near Havannah, the thermometer descend to 33° F. and at Vera Cruz, to 61°, a very remarkable depression of the mercury for countries situated under the torrid zone.

On the declivity of the Cordillera, at the height of from 4000 to 5000 feet,^f there constantly reigns the genial temperature of spring, which does not vary more than eight or nine degrees. Intense heat, and excessive cold, are equally unknown. This region is called by the natives *Tierras Templadas*, or, Temperate Countries, in which the mean heat of the whole year is from 68° to 70° F. This is the delicious climate of Xalapa, Tasco, and Chilpaningo, three towns celebrated for the extreme salubrity of their climate, and for the abundance of the fruit trees that are cultivated in their environs. Unfortunately this medium elevation of 4200 feet^g is almost the same as that at which the clouds float above the plains adjacent to the sea; for, in consequence of this circumstance, these temperate regions, situated half way up the mountains, are often enveloped in dense fogs.

The third zone, designated by the appellation of *Tierras Frias*, or, Cold Countries, comprehends the plateaus that are higher than 7200 feet^h above the level of the ocean, and of which the mean temperature is 63° F. and under. In the capital of Mexico, the centigrade thermometer has been seen some degrees below the freezing point; but this phenomenon is very rare. More commonly the winters are as mild there as at Naples. In the

^h "2200 metres."

coldest season, the medium heat of the day is from 55° to 58° F. In summer, the thermometer in the shade does not rise above 76° F. The most ordinary mean temperature that prevails over the whole of the great plateau of Mexico is 63° F. which is equal to the temperature of the air at Rome; and the olive-tree is here cultivated with success. This same plateau, however, according to the classification of the natives, belongs to the *Tierras Frias*. Thus the expressions *cold* and *hot* have no absolute signification. But those plateaus that are higher than the valley of Mexico, those, for example, whose absolute height exceeds 8200 feet,^a although situated under the tropics, have a climate which, even to an inhabitant of the north, appears rude and disagreeable. Of this description are the plains of Talma, and the heights of Guchilaqua, where, during a great part of the day, the air never becomes hotter than from 43° to 46° F. The olive here bears no fruit.

All the regions denominated cold enjoy a mean temperature of from 52° to 56° F. equal to that of France and Lombardy. Still, vegetation there is much less vigorous, and the plants of Europe do not grow with the same rapidity as in their native soil. The winters, at an elevation of 8200 feet,^b are not extremely severe. It must, however, be admitted, that, in summer, the sun never heats the rarefied air of these plateaus sufficiently to accelerate the expansion of flowers, and to bring the fruit to perfect maturity. It is this unvarying equability of temperature, this absence of a fervent but ephemeral heat, which impresses a peculiar character on the climate of the high equinoctial regions. Accordingly, the cultivation of many vegetables is less successful on the ridge of the Mexican Cordilleras, than in the plains situated to the north of the tropic, although the mean temperature of these latter is often lower than that of the plateaus comprised between 19° and 22° of north latitude.

In the equinoctial region of Mexico, and even as far as the 23th of north latitude, only two seasons are known; that, namely, of the rains, which commences in the month of June or July, and ends in September or October: and the dry season, which continues eight months, from October, namely, till the end of May. The formation of clouds, and the precipitation of the water dissolved by the air, generally begin on the eastern slope of the Cordillera. These phenomena, accompanied by loud electrical explosions, extend in succession from east to west, in the direction of the trade-winds; so that the rain falls fifteen or twenty days later on the central plateau than at Vera Cruz. Sometimes, in the months of December and January, rain, mixed with sleet and snow, is seen falling on the mountains, even at an absolute elevation of less than 6532 feet.^c These rains, however, continue only a few days; and, cold as they are, they are looked upon as highly beneficial to the vegetation of wheat, and the growth of pastures. From the parallel of 24° to that of 30°, the rains fall less frequently, and continue a shorter time. Fortunately, the snow, of which there is a very considerable quantity beyond 26° of latitude, compensates for this scarcity of rain.^d

In France, and in the greater part of Europe, the employment of land, and the agricultural divisions, depend almost exclusively on geographical latitude; the configuration of the country, the proximity of the ocean, or other local circumstances, exerting only a feeble influence over the temperature. On the other hand, in the equinoctial regions of America, the climate, the nature of the productions, the aspect, and general features of the country, are modified almost entirely by the elevation of the soil above the level of the sea. In latitudes 19° and 22°, sugar, cotton, and especially cacao and indigo, do not afford an abundant crop at a greater elevation than 2000 or 2600 feet.^e European wheat occupies a zone which, on the slope of the mountains, generally commences at the height of 4585 feet, and ends at 9752 feet.^f The banana, that most useful plant, which constitutes the principal nourishment of all the inhabitants of the tropics, almost entirely ceases to bear fruit above the level of 5000 feet.^g The oaks of Mexico grow only between 2500 and 10,078 feet^h of elevation. The pine descends towards the shores of Vera Cruz, only as low as 6068 feet;ⁱ but it must also be added, that they do not rise higher, towards the line of perpetual snow, than 13,123 feet.^k

The provinces denominated *provincias internas*, and situated in the temperate zone, but especially those comprehended between 30° and 38° of latitude, possess, with the rest of North America, a climate essentially different from that which prevails under the same parallels on the old continent: it is particularly distinguished by a striking inequality in the temperature of the different seasons. Winters of a German rigour succeed to summers that vie with those of Naples and Sicily. But this difference of temperature is much less striking in those parts of the new continent which approach the Pacific Ocean, than in the more eastern regions.

If the plateau of New Spain is singularly cold in winter, its summer temperature is far higher than could be inferred from the thermometrical observations made by Bouguer and La Condamine, in the Andes of Peru. It is to this heat, and to other local causes, that we must attribute the aridity which incommodes these beautiful countries. In fact, the interior, particularly an extensive portion of the plateau of Anahuac, is completely stripped of vegetation. The enormous mass of the Mexican Cordillera, and the immense extent of its plains, produce a reflection of the solar rays, which, at an equal height, is not observed in other mountainous countries of a more unequal surface. Independently of this circumstance, the land is so high that its mere elevation, from the consequently diminished atmospheric pressure which is exerted on fluids by the rarefied air, must sensibly augment the evaporation that takes place from the surface of these great plateaus. On the other hand, the Cordillera is not sufficiently elevated for any considerable number of its peaks to enter within the limit of perpetual snow. This snow, at the period of its minimum, in the month of September, does not descend, under the parallel of Mexico, lower than 14,465 feet;^m but in January, its boundary is met with as

^a "2500 metres."

^m "4500 metres."

low as 12,139 feet.^a To the north, beyond 20° latitude, and, especially, from 22° to 30°, the rains, which continue only during the months of June, July, August, and September, are by no means frequent in the interior of the country. The ascending current, or column of heated air that rises from the plains, prevents the clouds from being precipitated in the form of rain, and thus saturating the dry saline earth, almost destitute of shrubs. There are few springs in the mountains, which, in a great measure, are composed of porous amygdaloid and shattered porphyries. Instead of collecting in little subterraneous basins, the water filters through the earth, and loses itself in the crevices which have been opened by ancient volcanic convulsions. This water issues only at the base of the Cordillera. On the coasts, it forms a great number of rivers, the course of which, however, is very short.

The aridity of the central table land, and the want of trees, are very injurious to the working of the mines; these evils have sensibly increased since the arrival of Europeans in Mexico. Not only have the conquerors destroyed without planting, but by artificially drying up extensive tracts of land, they have occasioned a still more important evil. The muriates of soda and of lime, the nitrate of potash, and other saline substances, cover the surface of the soil. They have spread themselves with a degree of rapidity which the chemist feels it difficult to explain. In consequence of this abundance of salts—these effluences so injurious to cultivation—the table land of Mexico resembles, in some places, that of Thibet, or the saline steppes of central Asia.

Happily, this aridity of soil prevails only on the most elevated plains. A great part of the vast kingdom of New Spain may be classed with the most fertile countries of the earth. The declivity of the Cordillera is exposed to humid winds, and to frequent fogs; and vegetation, promoted by these aqueous vapours, displays an imposing degree of beauty and luxuriance. The truth is, the humidity of the coasts, favouring the putrefaction of a prodigious mass of organic substances, proves the cause of the diseases to which Europeans, and others not habituated to the climate, are exposed: for, under the burning sky of the tropics, the unhealthiness of the climate is almost invariably a sure indication of extraordinary fertility in the soil. Nevertheless, with the exception of some sea-ports, and of some deep and humid valleys, where the natives suffer from intermittent fevers, New Spain ought to be considered as a singularly healthy country. A dry and uniform degree of heat is very favourable to longevity. At Vera Cruz, in the midst of the epidemic attacks of the yellow fever (black vomit,) the natives, and those strangers who have been already some years habituated to the climate, enjoy the most perfect state of health. In general, the

coasts and arid plains of Equatorial America ought to be looked upon as healthy, notwithstanding the intense heat of the sun, the perpendicular rays of which are reflected from the soil.

Vegetation varies with the temperature, from the burning shores of the ocean, to the icy summits of the Cordilleras. In the hot region, as high as 1200 feet,^b the fan-leaved palms, the *miraguama* and *pumos* palms, the white *Oreodoxa*, the *Tournefortia velutina*, the *Cordia gerascanthus*, the willow-leaved *Cephalanthus*,^c the *Hyptis bursata*,^d *Salpianthus arenarius*, *Gomphrena globosa*, pinnated calabash tree,^e or *Crescentia pinnata*, the *Podopterus Mexicanus*, willow-leaved bignonia,^f *Salvia occidentalis*, *Perdicium Havanense*, *Gyrocarpus*, *Leucophyllum ambiguum*, *Gomphia Mexicana*, *Panicum divaricatum*, *Bauhinia aculeata*, *Hamatrylon radiatum*, *Hymenaea courbaril*, *Sclis retusis*, *Swietenia Mexicana*, and the sumac-leaved *Malpighia*,^g predominate in the spontaneous vegetation. On the confines of the temperate and the torrid zone are cultivated the sugar-cane, and the cotton, cacao and indigo plants; but they rarely ascend above the elevation of 1800 or 2400 feet.^h The sugar-cane, however, prospers well in the sheltered valleys, at an elevation of 6000 feetⁱ above the level of the sea. The banana tree extends from the shores of the sea, to a height of 4350 feet.^k The temperate region, from 1200 to 6600 feet^l of elevation, presents the *Liquidambar styraciflua*, *Erythroxylon Mexicanum*, *Aralia digitata*, *Cnicus Pazcuarensis*, *Guardiola Mexicana*, *Tagetes tenuifolia*, *Psychotria pauciflora*, *Ipomœa Cholulensis*, *Convolvulus arborescens*, *Veronica Xalapensis*, *Globularia Mexicana*, stachys of Actopan,^m *Salvia Mexicana*, *Vitex mollis*, thick-flowered arbutus,ⁿ *Eryngium protectorum*, *Laurus Cervantesii*, willow-leaved daphne,^o *Fritillaria barbata*, *Yucca spinosa*, *Cobœa scandens*,^p yellow sage;^q four varieties of Mexican oaks, commencing at an elevation of 2820 feet, and ending at 9720;^r the mountain yew,^s and the corrugated angular *Banisteria*. In the cold region, at a height of from 6600 to 14,100 feet,^t we meet with the thick stemmed oak (*Quercus crassipes*), the Mexican rose, the alder, which disappears at the height of 11,100 feet,^u the wonderful *Cheirostemon platanoides*, of which we shall speak further on, the *Krameria*, the *Valeriana ceratophylla*, the *Datura superba*, the cardinal sage,^v the dwarf potentilla,^w the myrtle-leaved arbutus,^x the *Coloneaster denticulata*,^y and the Mexican strawberry. The pines, which commence in the temperate zone at the height of 5700 feet, disappear in the cold region at 12,300 feet.^z Thus the *coniferous trees*, unknown in South America, here terminate, as they do in the Alps and Pyrenees, the scale of vegetation in the larger plants. At the very limit of perpetual snow, we find the *Arenaria bryoides*, the *Cnicus nivalis*, and the *Chelone gentianoides*.^{aa} We shall be able

to add a greater degree of interest to this dry nomenclature, when M. Humboldt has completed the botanical part of his vast and learned work.

Among the Mexican vegetables that furnish abundant alimentary supplies, the banana occupies the first rank. The two species, called the *Platano-arton*, and *Dominico*,^a appear to be indigenous; the *camburi*, or *Musa sapientum*, has been brought thither from Africa. One single cluster of bananas often contains from 160 to 180 fruits, and weighs from 60 to 80 pounds. A piece of land of 120 yards^b of surface, easily produces 4000 pounds weight^c of fruit, whilst the same extent will scarcely produce more than thirty pounds weight of wheat, or eighty pounds of potatoes. The manioc occupies the same region as the banana. The cultivation of maize is still more extended. This indigenous vegetable^d succeeds on the sea coast, and in the valleys of Toluca, at the height of 8400 feet^e above the ocean. Maize commonly produces in the proportion of 150 to 1. It forms the principal nourishment both of men and animals. Wheat, rye, barley, and the other cerealia of Europe, are cultivated nowhere but on the plateau in the temperate region. Wheat commonly produces at the rate of twenty-five or thirty for one. In the coldest region, they cultivate the potato, originally from South-America, the *Tropæolum esculentum*, a new species of *nasturtium* or Indian cress, and the *Chenopodium quinoa*, the seeds of which are an equally agreeable and healthy aliment. In the temperate and cold regions we also meet with the oca (*Oxalis tuberosa*);^f the sweet potato and the yam are cultivated in the hot region. Notwithstanding the abundant produce of so many alimentary plants, dry seasons expose Mexico to periodical famine.

This country produces indigenous species of the cherry-tree, apple, walnut, mulberry, and strawberry. It has likewise made the acquisition of the greater part of the fruits of Europe, as well as those of the torrid zone. The *maguey*, a variety of the agave,^g furnishes a drink denominated *pulque*, of which the inhabitants of Mexico consume a very great quantity. The fibres of the maguey supply hemp and paper; and the prickles are used for pins and nails.

The cultivation of sugar increases, although, generally speaking, it is confined to the temperate region, and, in consequence of the scanty population, the hot and moist plains of the sea coasts, so well adapted for the growth of this plant, continue in a great measure uncultivated. Ten years ago 1817, the exportation of sugar by the port of Vera Cruz amounted to 291,666*l.* sterling.^h The sugarcane here is cultivated and manufactured by free people.

In the burning climate of Guatimala, are produced the best indigo and the best cacao. The annual produce of the indigo plantations amounts to 500,000*l.*ⁱ the exportation of cacao alone is valued at 1,875,000*l.* sterling.^k It is from the Mexican language that we have derived the term *chocolatl*, of which, however, we have softened the final

^h "7,000,000 francs."

ⁱ "12,000,000 francs."

syllable. The nuts of the cacao, considered in Mexico as an article of the first necessity, are used instead of small coin; six nuts being equivalent to one sou.

The intendancy of Oaxaca, is at present the only province where they cultivate on a large scale the *Nopal*, or *Cactus coccinellifer*, upon which the insect that produces the cochineal delights to feed. Cochineal is annually exported to the amount of 500,000*l.* sterling.¹^m Among the other useful vegetables, we must notice the *Convolvulus jalapa*, or true jalap, which grows naturally in the district of Xalapa, to the north west of Vera Cruz; the *Epidendrum vanilla*, which, as well as the jalap, loves the shade of the liquidambar and the amyris; the *Copaifera officinalis*, and the *Toluifera balsamum*, two trees which produce odoriferous resins, known in commerce by the name of the balsams of Capivi and of Tolu.

The shores of the Bays of Honduras and Campeachy have been celebrated, since the period of their first discovery, for their rich and immense forests of mahogany and logwood, so useful in manufactures; but the cutting and selling of which has been seized upon by the English. A species of acacia affords an excellent black dye.ⁿ The guaiacum, the sassafras, and the tamarind, adorn and enrich these fertile provinces. The pine apple is found wild in the woods; and all the shallow rocky soils are covered with different species of Aloe and Euphorbia.

The gardens of Europe have made various acquisitions of new ornaments from the Mexican flora, and, amongst others, the *Salvia fulgens*, to which its crimson flowers give so much brilliance, the beautiful dahlia, the elegant *Sisyrinchium striatum*, the gigantic *Helianthus*, and the delicate *Mentzelia*. M. Bonpland, M. Humboldt's companion, discovered a species of bombax, which produces a cotton, possessing at once the brilliance of silk, and the strength of wool.

The zoology of Mexico is imperfectly known. Many species analagous to those with which we are acquainted, differ from them, nevertheless, in important characters. Among the species that are decidedly new and indigenous, are the *coendu*, a species of porcupine; the *apaxa*, or Mexican stag; the *conepatl*, of the weasel tribe; the Mexican squirrel, and another striated species.^o The *cayopollin*^p and the Mexican wolf inhabit the forests and mountains. Among the four animals classed as dogs by the Mexican Pliny, Hernandez, one, denominated *xolo-itzcuintli*, is the wolf, distinguished by its total want of hair. The *techichi*, is a species of dog without voice, which was eaten by the ancient Mexicans. This kind of food was so necessary to the Spaniards themselves, before the introduction of cattle, that in process of time, the whole race was destroyed.^q Linnæus confounds the dumb dog with the *itzcuinte-potzoli*, a species of dog very imperfectly described, and distinguished by a short tail, a very small head, and a large hump on its back.^r The bison and the musk ox^s wander in immense herds in New Mexico and

New California. The elks of the latter province, according to the testimony of Clavigero, are sufficiently strong to have been employed in dragging a heavy carriage at Zacatecas. We still know very little of the great wild sheep of California, or of the *berendos* of the same country, which, it would appear, resemble antelopes.^a The *jaguar*, and the *couguar*, which, in the New World, represent the tiger and lion of the old continent, are met with in all the kingdom of Guatimala, and in the lower and hot part of Mexico, properly so called; but they have been little observed by scientific naturalists. Hernandez says, that the *miztli* resembles the lion without a mane, but that it is of greater size.^b The Mexican bear is the same as that of Louisiana and Canada.^c

^c Mr. Bullock has added thirty-one species to this list, of which fifteen

The domestic animals of Europe conveyed to Mexico, have prospered there, and multiplied in a remarkable degree. The wild horses, which gallop in immense herds over the plains of New Mexico, are descended from those brought thither by the Spaniards. The breed is equally beautiful and vigorous. That of the mule is not less so. The transportation of goods between Mexico and Vera Cruz occupies 70,000 mules. The sheep are a coarse and neglected breed. The feeding of cattle is of great importance on the eastern coast, and in the intendency of Durango. Families are sometimes met with who possess herds of 40 or 50,000 head of cattle and horses. Former accounts speak of herds two or three times more numerous.^d

BOOK LXXXIV.

THE DESCRIPTION OF AMERICA CONTINUED.

Mexico, including New Mexico, and the Captain-Generalship of Guatemala. Account of the inhabitants.

IT now remains for us to consider the human species. The first official census, made in 1793, gave, as an approximating result, 4,483,500 inhabitants, as the minimum. Those who examined the lists in detail, reasonably concluded that the great number of inhabitants who had evaded the general census, could not possibly be compensated for by those who, wandering without fixed habitation, had been counted several times. It was supposed that, at least, a sixth or a seventh ought to be added to the sum total, thus estimating the population of the whole of New Spain at 5,200,000 souls.

Since that period, the augmentation in the produce of tithes, and of the Indian capitation tax, that of all the duties on articles of consumption, the progress of agriculture and of civilization, the appearance of the country covered with houses recently built, all combine to indicate a rapid increase of population in almost every part of the kingdom. The census has not, however, been renewed. Humboldt has shown that the proportion of births to deaths, deduced from a comparison of fifty years, is, at an average, nearly as 170 to 100. The proportion of births to the population appears to him to be as one to seventeen, and that of deaths as one to thirty. He estimates the number of births at nearly 350,000, and that of deaths, at 200,000; so that, under favourable circumstances, the excess of births ought to be 150,000; and if nothing ever deranged or disturbed the order of nature, the population ought to be doubled every nineteen years.^a Confining himself to the addition of only one tenth for those who are omitted in the census, and of two tenths for the increase of population in ten years, Humboldt concluded that, at the close of the year 1803, the kingdom of Mexico contained 5,800,000 inhabitants.^b According to the same progressive augmentation, Mexico ought to have contained, in 1813, a population of seven millions of inhabitants; but already, in 1810, civil disturbances had begun to overturn the kingdom. On the same principle, Mexico must have supported, in 1823, a population of 8,392,044; being about 60,000 more than 8,331,434, the population of England, exclusive of Wales and the public service, &c. in the census of 1811. Allowing half a million for wars, and the privations and diseases naturally incident to wars, eight millions still remain as a moderate estimate of the present population of this fine country.

To Guatemala only a million of inhabitants are assigned, not including the Mosquito Indians, who are independent of Spain, and are allies of England.

The physical causes that almost periodically check the increase of the Mexican population, are the small-pox, the *matlazahuatl*, a kind of plague, and especially poverty and famine.

The small-pox was introduced in 1520, when, according to the testimony of the Franciscan father Torribio, it carried off one half of the inhabitants of Mexico. Returning like the black vomit, and many other diseases, at pretty regular periods, it committed dreadful ravages in 1763, and especially in 1779, when, in the capital of Mexico alone, more than 9000 persons fell a sacrifice to the disease, and it cut off a great part of the Mexican youth. The epidemic of 1797 was less destructive, chiefly in consequence of the zeal with which inoculation was performed. But in the month of January, 1804, vaccination was introduced into Mexico; and, thanks to the activity of Don Thomas Murphy, who has repeatedly obtained the virus from North America, this cause of the depopulation of Mexico will cease to exist for the future.

The *matlazahuatl* is said to be a disease peculiar to the Indian race; and granting this to be the case, it shows itself only at very long intervals. It was particularly destructive in 1545, 1576, 1736, 1737, 1761, and 1762. Torquemada assures us, that in the first epidemic, 800,000 Indians died, and not less than two millions in the second. According to common opinion, this disease is identical with the yellow fever, or black vomit; but, according to others, it ought to be looked upon as a genuine plague. The *matlazahuatl*, it is said, never attacks white persons, whether Europeans or descendants of Creoles; while, on the contrary, the yellow fever very rarely attacks the Mexican Indians. The neighbourhood of the sea is the situation which is chiefly liable to the black vomit; the *matlazahuatl*, on the contrary, carries dismay and death to the farthest interior of the country on the central plateau. These distinctions, however, appear to us to be delusive, or, at all events, but imperfectly ascertained. In the hot and humid valleys of the interior, the *matlazahuatl* finds as favourable a focus for the development of its miasmata as on the sea coast. In the ravages which it commits in the interior, this plague appears more especially to attack the Indians, because, constituting the principal part of the population, their wretchedness more completely exposes them to the effects of an epidemic. When desolating the sea coasts, it appears to select its first and most numerous victims from among the European sailors and workmen, who compose the great mass of the people. The symptoms of the two diseases, as far as we are acquainted with them, bear a striking resemblance to each other.

^a A. de Humboldt, t. I. p. 324—341.

^b He estimated the population in 1808 at more than 6,500,000.—P.

A third circumstance which proves exceedingly destructive to population, and perhaps becomes the most fatal of all, is famine. Indolent by character, situated under a beautiful climate, and accustomed to content themselves with little, the Indians cultivate only as much maize, potatoes, and wheat, as seem barely necessary for their own subsistence, or, at the very most, as may be required for the consumption of the towns and mines in their immediate neighbourhood. Independently of this fact, agriculture is deprived of thousands of hands, in consequence of the necessity of transporting on the backs of mules their merchandise, provisions, iron, gunpowder, and mercury, from the coast to the capital, and thence to the mines and smelting houses, often established in arid and uncultivated regions. The disproportion between the natural progress of population, and the increase of the quantity of aliments produced by cultivation, renews therefore the afflicting spectacle of famine every time that an excessively dry season, or some other accidental cause, has ruined the harvest of maize. A want of provisions is almost always accompanied by epidemic diseases. In 1804 alone, the maize having been destroyed by frost towards the end of August, it was estimated that more than 300,000 inhabitants were swept away in the kingdom, in consequence of the want of nourishment and asthenic diseases. The civil war which has recently spread desolation over its surface, must have greatly increased the mortality annually arising from this circumstance. The 46,000 lives which a late official paper states to have been sacrificed in this war of liberty, only comprehends those who died in battle. The number of slain at all times, constitutes merely a small portion of the loss which the population of the country sustains by civil war.^a

For a long time the labour of the mines was looked upon as one of the principal causes of the depopulation of America. It would, no doubt, be very difficult to deny that, at the period of its original conquest, and even long afterwards, a great number of Indians perished from excessive fatigue, want of nourishment and sleep, and especially from the sudden change of climate and temperature in passing from the summit of the Cordillera deep into the bowels of the earth,^b a change which renders the working of the mines so destructive to a race of men who are not endowed with that flexibility of organization which distinguishes the European. In the present day, however, the labour of the mines in New Spain is a voluntary occupation; no law forcing the Indian to engage in it, or to prefer the working of one mine to that of another. In general, the number of persons employed in these subterraneous works, and divided into several classes, does not exceed 28 or 30,000; and the mortality among the miners is not much greater than what is observed among the other classes of the people.^c

In Mexico, the human species presents four great divisions, which comprehend eight *casts*, namely,

- I. ABORIGINAL INDIANS.
- II. SPANIARDS, (a) born in Europe;
(b) Creoles born in America.
- III. NEGROES, (a) Africans, slaves.
(b) descendants of negroes.

- IV. MIXED CASTS, (a) Mestizos, the offspring of whites and Indians;
- (b) Mulattoes, the offspring of whites and negroes;
- (c) Zambos, arising from a mixture of Indians and negroes.

Some Malays and Chinese, who have come from the Philippine Islands to establish themselves in Mexico, cannot be included in this enumeration. The number of copper-coloured Indians of pure race, principally concentrated in the southern part of the table land of Anahuac, exceeds two millions and a half; thus forming about two fifths of the entire population. They are infinitely more rare, however, in the north of New Spain, and the provinces denominated *provincias internas*.

Far from becoming extinct, the indigenous population has continued to increase, especially during the last hundred years; and accordingly it would appear that, in total amount, these countries are more populous at present than they were previously to the arrival of the Europeans. The kingdom of Montezuma did not equal in extent the eighth part of New Spain, as it now exists. The great towns of the Aztecs, and their most cultivated lands, were met with in the environs of the capital of Mexico, and particularly in the beautiful valley of Tenochtitlan. The kings of Alcolhuacan, of Tlacopan, and of Mechoacan, were independent princes. Beyond the parallel of 20° were the Chichimecks and Otomites, two wandering and barbarous nations, whose hordes, though far from numerous, pushed their incursions as far as Tula, a town situated near the northern border of the valley of Tenochtitlan. It would be just as difficult, however, to estimate, with any degree of accuracy, the number of Montezuma's subjects, as it would be to decide respecting the ancient population of Egypt, Persia, Carthage, or Greece, or even respecting that of many modern states. History presents us, on the one hand, with a train of conquerors ambitious to throw additional lustre on their own exploits; on the other, certain religious and benevolent men, directing, with noble ardour, the arms of eloquence against the cruelty of the first colonists.^d Both parties are equally interested in exaggerating the flourishing condition of the newly discovered countries. At all events, the extensive ruins of towns and villages that are met with under the 18th and 20th degrees of latitude in the interior of Mexico, seem to prove that the population of this single part of the kingdom was once far superior to what it is now. Yet it must be remarked, that these ruins are dispersed over a space that, relatively speaking, is but very limited.

To a great degree of muscular strength, the copper-coloured natives add the advantage of being seldom or never subject to any deformity. Humboldt assures us that he never saw a hunch-back Indian, and that they very seldom squint, or are met with crippled in any of their limbs. In those districts where the inhabitants suffer from the goitre, this affection of the thyroid gland is never observed among the Indians, and rarely among the Mestizos. The Indians of New Spain, and especially the women, generally live to an advanced age. Their hair, it is said, never turns gray, and they preserve all their strength till the pe-

riod of their death. In respect of the moral faculties of the indigenous Mexicans, it is difficult to form a just estimate of them, if we consider this unhappy nation almost in the only light in which there has been an opportunity of viewing it by intelligent travellers, as sinking under long oppression, and depressed almost to the lowest point of degradation. At the commencement of the conquest, the wealthiest Indians, those, in short, among whom a certain degree of intellectual cultivation may be supposed to have existed, almost entirely perished, the victims of European ferocity. Christian fanaticism raged especially against the Aztec priests. The ministers of religion were exterminated; all those, in fact, who inhabited the *houses of God*, and who might be considered as depositories of the historical, mythological, and even astronomical knowledge of the country; for it was the priests who observed the meridian shade on the dials, and regulated the intercalations. The Spanish monks burned the hieroglyphical paintings, by which knowledge of every kind had been transmitted from generation to generation.^a Deprived of these means of instruction, the people sunk back into a degree of ignorance which became the more profound, because the missionaries, little versed in the Mexican languages, substituted few new ideas in place of the ancient ones that had thus been lost. The Indian women who still preserved some fortune, preferred an alliance with their conquerors to sharing the general contempt which was entertained for their nation. Of the natives, therefore, only the most indigent class remained, the poor husbandmen, the artisans, among whom were to be reckoned a great number of weavers, the porters, who, from a want of the larger quadrupeds, were made use of as beasts of burthen, and above all, that refuse of the people, the crowd of mendicants, who proving at the same time the imperfection of social institutions, and the yoke of feudalism, already, even in the time of Cortez, filled the streets of all the great towns of the Mexican empire. How, therefore, from such miserable remains of a once powerful people, can we possibly judge either of the degree of cultivation to which they had been raised, from the twelfth to the sixteenth century, or of the intellectual development of which they are susceptible? Still, however, we cannot doubt that a part of the Mexican nation had attained a certain degree of improvement, when we reflect on the care with which the hieroglyphical books were composed, and call to mind that a citizen of Tlascalala, surrounded by the perils and din of war, profited by the facility which our Roman Alphabet afforded him, to write in his native language five large volumes upon the history of a country, of which he deplored the subjugation. The Mexicans possessed an almost exact knowledge of the true length of the year, which they intercalated at the end of their great cycle of a hundred and four years,^b with more exactness than the Greeks, the Romans, or the Egyptians. The Toltecs appeared in New Spain in the seventh century, and the Aztecs in the twelfth. Even at this period they drew out a geographical map of the country which they had traversed; they built towns, and formed roads, dikes, canals, and immense pyramids, the faces of which

were accurately directed to the four cardinal points, and the base extended the length of 474 yards.^c Their feudal system, and their civil and military hierarchy, were even then of so complicated a nature, that we must naturally suppose the previous existence of a long series of political events, in order that their singular concatenation of public authorities, of nobility and clergy, could have been established, and that a small portion of the people, slaves themselves of the Mexican Sultan, could have subjugated the great mass of the nation. Small tribes, weary of tyranny, had given themselves republican constitutions, which can never be formed, except in consequence of long continued popular tumults, and the very establishment of which indicates no recent civilization. But from whence did this come, or where did it take its rise? Accustomed servilely to admit exclusive systems, and knowing only how to learn without meditating, we forget that civilization is nothing but the employment and development of our moral and intellectual faculties. The inimitable Greeks attributed their superior civilization to Minerva; in other words, to their own proper genius; yet we obstinately persist in giving them the Egyptians as masters. These, on the other hand, revered Osiris as their first great teacher; while we affect to look for the source of their civilization in India. But, in that case, who instructed the Indians? Was it Brama, Confucius, Zoroaster, Manco-Capac, Idacanzas, or Bochica? Every thing must have a beginning; and if civilization could rise into existence in the Old Continent, why might it not also have done the same in the New? The total want of wheat, oats, barley, and rye, of those nourishing grasses which are designated by the general name of *cerealia*, or corn, appears to prove that, if any Asiatic tribes really have passed into America, they must be descended from some wandering or pastoral people. In the old continent we find the cultivation of the *cerealia*, and the use of milk, already introduced at the most remote period of which history preserves any record. The inhabitants of the New Continent cultivated no other grain than maize (*zea*;) they consumed no preparation of milk, although two species of the ox, natives of the north, might have afforded them milk in abundance. These are striking contrasts, and taken in conjunction with the results of a comparison of languages, they prove that the Mongol race could never have contributed any thing but wandering tribes to the original population of America.

In his present condition, the Mexican Indian is grave, melancholy, and taciturn, as long as he is not under the influence of intoxicating liquors. This gravity is particularly remarkable in the children of Indians, who, at the early age of four or five years, display much greater intelligence and development of mind than the children of whites. He delights in throwing an air of mystery over his most trifling remarks. Not a passion manifests itself in his features. At all times gloomy, there is something terrific in the change, when he passes all at once from a state of absolute repose to violent and ungovernable agitation. The energy of his character, to which every shade of softness is unknown, habitually degenerates into fero-

^a See Humboldt's *Researches on the Institutions and Monuments of Ancient America*, Pref. p. 3.

^b *Ibid.* I. 287. The Mexicans intercalated 13 days every 52 years. The cycle of 104 years was simply religious.—Tr. The Mexican civil year was a solar year of 365 days, divided into 18 months, of 20 days each, to which were added 5 intercalary days. Each month was divided into 4 weeks of 5

days each. Thirteen years formed a cycle, 4 of which constituted a period of 52 years, at the end of which 13 days were intercalated, which made their year agree with the Julian period of 365 days 6 hours. Two of these periods of 52 years formed a period of 104 years, called an old age.—P.

^c "438 metres."

city. This is especially the case with the inhabitants of Tlascalala. In the midst of their degradation, the descendants of these republicans are still distinguished by a certain haughtiness with which they are inspired by the remembrance of their former greatness. The indigenous natives of Mexico, like all other nations who have long groaned under civil and religious despotism, are attached, with an extreme degree of obstinacy, to their habits, their manners, and their opinions. The introduction of Christianity among them has scarcely produced any other effect than merely substituting new ceremonies, the symbols of a mild and humane religion, for the ceremonies of a sanguinary worship. From the earliest periods, semibarbarous nations have received new laws and new divinities from the hands of their conquerors. The indigenous and vanquished gods give place to foreign deities. Besides, in a mythology as complicated as that of the Mexicans, it was easy to discover an affinity between the divinities of Atzlan and those of the east. The Holy Spirit, for instance, was identified with the sacred eagle of the Aztecs. The missionaries not only tolerated, they even favoured this mixture of ideas, by which the Christian worship became more speedily established.^a The English collector, Mr. Bullock, readily obtained leave from the clergy and authorities, in 1823, to disinter and take casts from the image of the sanguinary goddess *Teoyamiqui*. During the time it was exposed, he adds, "the court of the University was crowded with people, most of whom expressed the most decided anger and contempt. Not so, however, all the Indians. I attentively marked their countenances; not a smile escaped them, or even a word—all was silence and attention. In reply to a joke of one of the students, an old Indian remarked, 'It is true we have three very good Spanish gods, but we might still have been allowed to keep a few of those of our ancestors.' I was informed that chaplets of flowers had been placed on the figure by natives, who had stolen thither unseen, in the evening, for that purpose: a proof that notwithstanding the extreme diligence of the Spanish clergy for 300 years, there still remains some taint of heathen superstition among the descendants of the original inhabitants."^b Yet it was probably a nobler impulse than superstition that wove the chaplet for the statue of *Teoyamiqui*; rather that mystery of nature, by which she links the present to the past with veneration, and to the future with anxiety,—that awful reverence with which the rudest nations look back to their origin and ancestors, and which even now, amongst the most enlightened, still consecrates the relics of Montmorillon and Stonehenge.

The Mexicans have preserved a particular taste for painting, and for the art of carving in stone and wood. It is truly astonishing to see what they are capable of executing, with a bad knife, upon the hardest wood. They are particularly employed in painting the images and carving the statues of saints; but from a religious principle, they have continued servilely to imitate, for 300 years, the models which the Europeans brought with them at the period of the original conquest. In Mexico, as well as Hindostan, the faithful were not allowed to make the smallest change in their idols: Every thing connected with the rites of the

Aztecs was subjected to immutable laws. It is on this very account that the Christian images have preserved, in some degree, that stiffness and hardness of feature which characterized the hieroglyphical pictures of the age of Montezuma. They display a great deal of aptitude for the exercise of the arts of imitation, and still greater for those of a purely mechanical nature.

When an Indian has attained a certain degree of cultivation, he shows great facility in acquiring information, a precise and logical understanding, and a particular tendency to subtilize, or to seize on the minutest differences in objects that are to be compared with each other. He reasons coldly and with method; but he does not evince that activity of imagination, that lively freshness of sentiment, that art of creating and of producing which characterizes the people of Europe and many tribes of African negroes. The music and dancing of the indigenous natives partake of that want of cheerfulness which is so peculiar to them. Their singing is of a melancholy description. More vivacity, however, is observed in their women than in their men; but they share the evils of that state of subjection to which the sex is condemned among most of those nations where civilization is still imperfect. In the dance women take no part; they are merely present for the sake of offering to the dancers the fermented drinks which they themselves have prepared.^c

The Mexican Indians have likewise preserved the same taste for flowers that Cortez noticed in his time. We are astonished to discover this taste, which doubtless indicates a taste for the beautiful, among a people in whom a sanguinary worship, and the frequency of human sacrifices, appeared to have extinguished every feeling connected with sensibility of mind and the softer affections. In the great market of Mexico, the native does not sell even fish, or pine-apples, or vegetables, or fermented liquor, without his shop being decked out with flowers, which are renewed every succeeding day. The Indian shop-keeper appears seated behind a perfect entrenchment of verdure, and every thing around him wears an air of the most refined elegance.

The Indian hunters,^d such as the *Mecos*, the *Apaches*, and the *Lipans*, whom the Spaniards comprehend under the denomination of *Indios bravos*, and whose hordes, in their incursions, which are often made during the night, infest the frontiers of New Biscay, Sonora, and New Mexico, evince more activity of mind, and more strength of character, than the agricultural Indians. Some tribes have even languages, the mechanism of which appears to prove the existence of ancient civilization. They have great difficulty in learning our European idioms, while, at the same time, they express themselves in their own with an extreme degree of facility. Those same Indian chiefs, whose gloomy taciturnity astonishes the observer, will hold a discourse of several hours whenever any strong interest rouses them to break their habitual silence. We shall afterwards enter into some further details with regard to these tribes.

The indigenous natives are either descendants of ancient plebeians, or the remains of some great family, who, disdaining to ally themselves with their conquerors, the

^a Vide Humboldt's Researches, (English edition) vol. II. p. 176. Essai Politique, I. p. 95.

^c A. de Humboldt, t. I. p. 413.

^d "Indiens chasseurs,"—the Indians who live by hunting; the wild Indians, or hunting tribes.

Spaniards, have preferred cultivating, with their own hands, those very fields, which were formerly cultivated by their vassals. They are divided accordingly into tributary Indians and Indian Caciques, who agreeably with the Spanish laws, ought to participate in the privileges of the nobility of Castile. But it is difficult to distinguish by their exterior, their dress, or their manners, the nobleman from the plebeian. They generally go barefooted, and are dressed in the Mexican tunic, which is of a coarse quality, and of a blackish brown colour. In short, there is no difference between their dress, and that of the common people, who, notwithstanding, show them a great deal of respect. Nevertheless, far from protecting their countrymen, those individuals who enjoy the hereditary privileges of the *Caciquate* are very oppressive to such as are tributary. Exercising the magistracy in the Indian villages, it is they who levy the capitation tax. Not only do they delight in becoming the instruments of the oppressions of the whites, but they also make use of their power and authority for the purpose of extorting petty sums for their own profit. Independently of this, indeed, the Aztec nobility are remarkable for the same grossness of manners, the same want of civilization, and the same ignorance, as the lower classes of Indians. Isolated, and living in a state of degradation, it has rarely happened that any of its members have followed the profession of the robe or the sword. A greater number of Indians have embraced the ecclesiastical condition, especially that of curate. The solitude of the convent appears to have attractions for none but young Indian girls.

Considered in a general point of view, the Mexican Indians present a picture of extreme wretchedness. Indolent from disposition, and still more so from the effects of their political situation, they live only from day to day. In place of general ease of circumstances, families are met with whose fortune appears so much the more extensive as it is the less expected. Nevertheless, the existing laws, in general mild and humane, secure to them the fruit of their exertions, and full liberty for the sale of their productions. They are exempt from all indirect imposts, and are merely subject to a capitation tax, which is paid by the male Indians from ten to fifty years old, and the burthen of which has been latterly much alleviated. In 1601, the Indian paid annually 32 reals of tribute, and four of royal service; making a total of nineteen shillings and twopence sterling.^a Little by little, it has been reduced, in some of the intendancies, to twelve shillings and sixpence, and even to four shillings and twopence.^b In the bishopric of Mechoacan, and in the greater part of Mexico, the capitation tax amounts at present to nine shillings and twopence.^c But if legislation appears to favour the natives with regard to taxes, it has, on the other hand, deprived them of the most important rights which the other citizens enjoy. In an age, when it was formally debated whether the Indians were actually reasonable beings, it was considered as granting them a singular favour to treat them as minors, by placing them under the perpetual tutelage of the whites, and by declaring null every act signed by a native of the copper-coloured race, and every obligation which he contracted of above the value of twelve shillings and sixpence.^d

These laws, maintained in their full vigour, raise insurmountable barriers between the Indians and the other castes, with whom intermarriage is likewise prohibited, while their disunion, as well as that of their families and constituted authorities, has always been considered by Spanish policy as the surest means of preserving the colonies in a state of dependence on the mother country. The law not only interdicts the mixture of the castes, but prevents the whites from living in the Indian villages, and prohibits the natives from establishing themselves among the Spaniards. The Indians govern themselves; but their magistrates, generally the only individuals in the village who speak Spanish, have an interest in keeping their fellow citizens in a state of the profoundest ignorance. Restricted to a narrow space, the radius of which is only 542 yards,^e the boundary assigned by an ancient law to the Indian villages, the natives are, in some measure, destitute of individual property; they are bound to cultivate the common property, without the hope of ever reaping the fruit of their labours. The new regulation of the intendancies directs that the natives are no longer to receive assistance from the common funds without special permission from the college of finances of Mexico. The common property has been farmed out by the intendants, and the produce is paid into the royal treasury, where the government clerks keep, under particular heads, an account of what they call the property of each village. But it has become so tedious and so difficult to obtain for the natives any assistance from these funds, that they have ceased applying for it. Either by a singular fatality, or from a fault inherent in all social organization, the privileges accorded to the Indians, far from being the means of obtaining them any advantage, have, in reality produced effects constantly unfavourable to this caste, and have actually furnished the means of oppressing them.

The Spaniards occupy the first rank in the population of New Spain. It is in their hands that almost all the property and riches of the kingdom are retained. Yet they would occupy only the second place among the inhabitants of pure race, if they were considered according to their numbers, which, in New Spain, may amount to 1,200,000, of which one quarter inhabit the internal provinces.^f They are divided into the whites born in Europe, and the descendants of Europeans, born in the Spanish colonies of America, and the Asiatic Islands. The former have received the appellation of *Chapetons*, or *Gachupinos*; the second that of *Criollos*.^g The natives of the Canary Islands, who are generally designated by the denomination of *Islenos*, and who, for the most part, are overseers and agents of plantations, are considered as Europeans. The *Chapetons* are estimated as one to fourteen. To all of them the laws grant the same rights; but those who are nominated to assist in their execution, exert themselves to destroy that equality which wounds European pride so deeply. The government bestows the higher offices exclusively on natives of old Spain; and for some years back, has disposed, even at Madrid, of the most trifling situations in the management of the customs, or in the collection of the taxes. The most miserable European, without education, without intellectual cultivation, thinks

himself superior to the whites who are born in the New Continent. He knows that, protected by his countrymen, and favoured by those chances which are common in a country where fortunes are acquired as rapidly as they are destroyed, he may, one day or other, attain those offices, the access to which is almost interdicted to the natives, even to those who are distinguished by their talents, their knowledge, and their moral qualities. A system of venality, in particular, has made frightful progress amongst them. From this have arisen motives of jealousy and perpetual hatred between the Chapetons and the Creoles. Consequently, since the emancipation of the English colonies, and particularly since 1789, the latter have been often heard to exclaim, in a haughty manner, "I am not a Spaniard, I am an American!" expressions which betray the effects of long cherished resentment.

The castes of mixed blood, proceeding from an intermixture of the pure races, compose almost as considerable a portion of the people as the indigenous natives. We may estimate the total number of individuals of mixed blood at nearly 2,400,000 souls. By a refinement of vanity, the inhabitants of the colonies have enriched their language, by applying names to the most delicate shades of tint that arise from the degeneration of the primitive colour. The son of a white, either an European born, or a Creole, and of a native female of the copper-colour, is called *Mestizo*. His colour is almost a perfect white, and his skin has a peculiar transparency. The scanty beard, the small size of the hands and feet, and a certain obliquity of the eyes, oftener serve to proclaim a mixture of Indian blood, than the nature of the hair. If a female *Mestizo* marry a white, the second generation which results from this union scarcely differs in any respect from the European race. The *Mestizos* compose, in all probability, seven-eighths of the whole population of the castes. They are looked upon as possessing a milder character than the *Mulattoes*—the offspring of the whites and the negroes, who are conspicuous for the intensity of their colour, the violence of their passions, and their singular volubility of speech. The descendants of negroes and Indian women are known at Mexico, at Lima, and even at Havannah, by the absurd name of *Chino*, Chinese. On the coast of Caraccas, and even in New Spain itself, they are likewise called *Zambos*. At present, this latter term is principally confined to the descendants of a negro and a female *Mulatto*, or of a negro and a female *Chino*. These common *Zambos* are distinguished from the *Zambos Prietos*,^a who are born of a negro and a female *Zambo*. The castes of Indian and African blood preserve the odour which is peculiar to the cutaneous transpiration of these two primitive races. From the union of a white with a female *Mulatto*, proceeds the caste of the *Quarterons*. When a female *Quarteron* marries an European, or a Creole, her children are termed *Quinterons*. A fresh alliance with the white race so completely obliterates all remaining traces of colour, that the children of a white and a female *Quinteron*, are white also. Those mixtures by which the colour of the infant becomes darker than that of its mother, are called *Salta-atras*, or back-steps.^{b c}

The greater or less quantity of European blood, and the skin being more or less clear, are at once decisive of the consideration which a man enjoys in society, and of the

opinion which he entertains of himself. A white who rides barefooted, fancies that he belongs to the nobility of the country. Colour even establishes a certain equality between those who, as every where happens where civilization is either little advanced, or in a state of retrograde movement, take pleasure in refining on the prerogatives of race and origin. When an individual of the lower orders enters into a dispute with one of the titled lords of the country, it is no unusual thing to hear him exclaim to the nobleman, "Is it possible that you really thought yourself whiter than I am?" Among the *Mestizos* and *Mulattoes* there are many individuals who, by their colour, their physiognomy, and their intelligence, might be confounded with the Spaniards; but the laws keep them down in a state of degradation and contempt. Possessing an energetic and ardent character, these men of colour live in a state of constant irritation against the whites; and resentment too often hurries them into vengeance. It frequently occurs, too, that families who are suspected of being of mixed blood, claim, at the high court of justice, a declaration that they appertain to the whites. In this way, very dark coloured *Mulattoes* have had the address to get themselves *whitened*, according to the popular expression. When the judgment of the senses is too palpably in opposition to the solicitations of the applicant, he is forced to content himself with somewhat problematical terms; for, in that case, the sentence simply states, that "such and such individuals may consider themselves as white."

Of all the European colonies under the torrid zone, the kingdom of New Spain is the one in which there are the fewest negroes. One may walk through every part of the city of Mexico, without seeing one single black face. Slaves are never employed to perform the domestic services of any house there. According to the most authentic information, it would appear that in the whole of New Spain there are not 6000 negroes, and, at the very utmost 9000 or 10,000 slaves, the greater part of whom inhabit the ports of Acapulco and Vera Cruz, or the hot region in the vicinity of the coasts. These slaves are prisoners who have been taken in the petty warfare that is almost continual on the frontiers of the internal provinces. For the most part, they belong to the nation of the *Mecos*, or *Apaches*, a race of untractable and ferocious mountaineers, who most commonly sink speedily under the influence of despair, or of the change of climate. The increase of the colonial prosperity of Mexico is altogether independent, therefore, of the slave trade. It is only twenty years ago, 1817, that Mexican sugar was almost unknown in Europe; at present, however, Vera Cruz alone exports more than 120,000 quintals, and yet the number of slaves is not sensibly augmented by the progress which has been made in the cultivation of the sugar cane in New Spain, since the revolutionary changes in St. Domingo. Besides, in Mexico, as in all the Spanish possessions, the slaves are rather better protected by the laws than the negroes who inhabit the colonies of the other European nations. The law is always interpreted in favour of liberty. The government is desirous of seeing the number of enfranchised slaves increase. A slave who, by his own industry, has become possessed of some money, may force his master to enfranchise him, on paying him the sum of from 62*l.* to 83*l.* 6*s.* sterling,^d even where he has

^a Black-Samboes.

^b Properly, leaps backward.

^d "1500 to 2000 francs."

originally cost the proprietor twice that amount, or is gifted with some particular talent for exercising a lucrative business. A slave, who has been cruelly ill-treated, obtains, according to law, a right to his freedom from that very circumstance. Humboldt himself saw an instance of this.

The languages spoken throughout the vast extent of Mexico, are more than twenty in number, and are part of them, however, known only by name. The Creoles, and the greater part of the mixed races, have not adopted here, as they have in Peru, an indigenous dialect, but make use of the Spanish language, both in conversation and in writing. Among the native dialects, the Aztec or Mexican tongue is the most widely diffused; it extends at present from the parallel of 37° to the vicinity of lake Nicaragua, but the peculiar regions of several other languages appear to be inclosed, as it were, within that of the Mexican. The historian Clavigero has proved that the Toltecs, the Chichimecks, (from whom the inhabitants of Tlascalala are descended,) the Acolhuacs, and the Nahuatlacs, all spoke the same language as the Aztecs.^a The repetition of the syllables *lli, lla, ill, atl*, joined to the length of the words, which sometimes consist of eleven syllables, must render this language far from being agreeable to the ear. But, at the same time, the complication and richness of its grammatical forms, seem to prove the high intelligence of those who invented or methodised it. An extremely limited number of analogies between their words, appears to give it an affinity to the Chinese and the Japanese; but its general character weakens the resemblance. The Otomite language, spoken in the ancient kingdom of Mechoacan, or in New Galicia, is an original language composed of monosyllables like the Chinese, and therefore entirely different from the Mexican, and appears to have been very extensively diffused.^b It is impossible to say whether the *Tarasc*, *Matlazing*, and *Cora* idioms, likewise spoken in New Galicia, are branches of the same trunk, or original languages independent of each other: one thing is certain that those words of the *Tarasc* and *Cora* languages with which we are acquainted, present very little affinity with the other languages of America. The *Tarahumara* and *Tepehuan* languages, spoken in New Biscay; the idiom of *Pimas*, used in Pimeria, a district of Sonora; that of the *Apaches*, the *Keras*, the *Piras*, the *Tiguas*, and other tribes of New Mexico; the *Guaicura* language spoken in California by the *Moquis*; that of the *Cochimis*, and of the *Pericues*, in the same peninsula; that of the *Eslenes*, and

Rumsens,^c in New California, still present a chaos of doubt and obscurity. In the *Tarahumara*, the names of the numbers are Mexican. It is remarkable that a dialect of the *Guaicura* is termed *Cora*, and that the name of the *Moquis* of California is again met with in New Mexico.^d More accurate knowledge will doubtless reduce this crowd of tribes to a small number of distinct races.^e

The *Huastec* language, which has been preserved in the district of Huasteca, in the intendency of Mexico, appears to differ entirely from the Mexican, both with regard to words and grammar.^f It exhibits some *Finnish* and *Ostiak* words; might it not, therefore, be traced to the first invasion of the tribes of Northern Asia; an invasion anterior to that in which the ancestors of the Aztecs, the Toltecs, and the Chichimecks, must have borne a part?

It appears that, in advancing to the south of Mexico, the indigenous languages, independent of that of the Aztecs, become extremely numerous. The intendancies of Puebla and Oaxaca, contain the *Zapoteca*, *Totonaca*, *Mixteca*, *Popolonga*, *Chinanteca*, and *Mixe* languages, and many others less known.^g The *Maya* tongue, which is in general use in Yucatan, appears to us to contain *Finnish* and *Algonquin* words. The learned Hervas has observed in it a certain number of Tonquinese words,^h amongst which there are some that are common to different idioms of Siberia and to the Finnish.ⁱ This language is composed of monosyllables, like the most ancient ones of eastern Asia; but it is superior to them by its grammatical combinations. It appears to be derived from the same general root as the Otomite, of which we have already spoken. In the kingdom of Guatemala, the *Chiapanese* language, the *Caqui-quel*, the *Uilateca*, the *Lakandone*, and others, still remain to be the objects of farther research. The principal of those that are spoken in this kingdom is called the *Poconchi* or *Pocomane*, which bears manifest affinity with the *Maya* language, and therefore ought to differ radically from the Mexican, which, however, was very much spoken in that country before the invasion of the Spaniards, and at present is the prevailing language. The *Guaymi* tongue, in the province of Veragua, is conceived to have some analogy with the Caribbean, and would thus prove an invasion of some tribes from South America; this circumstance, however, is mentioned with hesitation. The idiom of the *Mosquito Indians* on the coast of Honduras has not been studied.

We shall now proceed to the topographical description.

BOOK LXXXV.

THE DESCRIPTION OF AMERICA CONTINUED.

*Continuation and conclusion of the description of Mexico.—
Topography of the Provinces and Towns.*

THE Spaniards have given the name of *New California* to all the western coasts, situated between the port of *San Diego*,^a and the northern, but hitherto undefined boundary of their possessions.^b The celebrated English navigator, Sir Francis Drake, designated a part of these coasts by the name of *New Albion*; but, in our *History of Geography*, we shall see that the claim of priority of discovery belongs to the Spaniards. Nevertheless, the English name has remained on the maps, attached to that portion of the territory in which the Spaniards have formed no establishment, from the 38th to the 44th parallel, or even beyond it. In the neighbourhood of *Cape Mendocino*, the interior of *New Albion* presents the distant prospect of several peaks of mountains, covered with snow even in summer; but when Sir Francis Drake thought that he even discerned snow upon the lower mountains, in the environs of the harbour which bears his name, in latitude 38° 10', he was probably deceived by the appearance of sand or very white rocks.^c The natives in the vicinity of *Cape Oxford*, exhibit some European features. Their complexion is a clear olive; their stature is above the middle size; and they have a mild and honest disposition. They tattoo their skin, and speak a language different from that of *Nootka*. The inhabitants of *Trinidad Bay* have the custom of filing all their teeth, horizontally, down to the very gums.^d

New California, considered as a Spanish province, is a narrow stripe, which borders the coasts of the Pacific Ocean, from port *San Francisco* to the settlement of *San Diego*. Under a sky which is often foggy and humid, but extremely mild, this picturesque country on every side displays to the view magnificent forests and verdant savannas, where numerous herds of deer, or elks of a gigantic size, graze undisturbed. The soil has easily admitted of different kinds of European cultivation. The vine, the olive, and wheat, prosper there. In 1802, there were eighteen missions, and the population of permanent cultivators amounted to 15,560 individuals.^e

San Francisco, the most northern military post or *presidio*, is situated upon an extensive bay of the same name, into which a large river empties itself; probably the *Rio San Felipe*, issuing from the lake *Timpanogos*.^f Near the mission of *Santa Clara*, wheat produces from twenty-five to thirty for one, and requires very little care. The har-

vest is reaped in July. Beautiful forests of oak, intermingled with high and low *prairies*, give the country all the appearance of a natural park.^g *San Carlos de Monterey* is the seat of the governor of the two Californias. The port of *Monterey* is very far from meriting the celebrity which it has received from the Spanish navigators; it is a bay, with an indifferent anchorage. The aspect of the country is charming, and the inhabitants enjoy a perpetual spring.^h The soil becomes richer the farther you penetrate into the interior. *Santa Barbara*, the principal town of a jurisdiction, is situated on a canal of the same name, formed by the continent and some islands, of which *Santa Cruz* and *Santa Catalina* are the most considerable. The mission of *San Buenaventura*, to the east of this *presidio*, occupies a fertile country, but is exposed to great droughts, which is generally the case with all this coast. Vancouver saw abundance of fruit of excellent quality growing in the garden of the missionaries, such as apples, pears, figs, oranges, grapes, pomegranates, two species of banana, cocoa-nuts, sugar canes, indigo plants, and several kinds of garden vegetables. The environs of *San Diego* are gloomy and barren. The territory of the mission of *San Juan de Campistrano* supports excellent cattle.

The indigenous natives are divided into a great number of tribes, speaking entirely different languages. The *Matalans*, the *Salsen*, and the *Quirotes*, near the bay of *San Francisco*, and the *Rumsen*, and *Escelen*, near *Monterey*, are the best known of these Indians. The name of *Quirote* recalls that of the kingdom of *Quivira*, placed in the same spot, on a large river, by the early Spanish geographers, who related the discoveries of *Cabrillo* and *Vizcaino*.

Old California, or the peninsula of California, properly so called, is bounded by the ocean on the south and west, and by the Gulf of California, likewise called the *Vermilion Sea*, on the east. It crosses the tropic, and terminates in the torrid zone, in *Cape St. Lucas*. Its breadth varies from ten to forty leagues from the one sea to the other. Its climate in general is very hot, and very dry. The sky, which is of a deep blue colour, is scarcely ever obscured by clouds; and when any are seen floating in the horizon at sunset, they display brilliant tints of purple and emerald. But this beautiful sky stretches over an arid sandy country, where the cylindrical cactus,ⁱ rising from the clefts of the rocks, is almost the only vegetable production that relieves the absolute barrenness of the scene.^k

In some rare spots, where there is water and vegetable mould, fruit and corn multiply in an astonishing manner, and the vines afford a generous wine, similar to that of the Canaries. A species of sheep,^a of a very large size, is also met with, which affords exceedingly delicate and excellent food, and its wool is easily spun. A considerable number of other wild quadrupeds, as well as a great variety of birds, are named. The pearls that are fished on the coast of California have a beautiful water, but are of an irregular figure. The gold mines which popular tradition has placed in this peninsula, consists in reality of merely a few scanty veins. At the distance of fourteen leagues from Loreto, two mines of silver have been discovered, which are considered as tolerably productive; but the want of wood and of mercury, renders it almost impossible to work them.^b In the interior of the country there are plains covered with a beautiful crystalline salt. Since the missions of old California have been on the decline, the population has been reduced to less than 9000 inhabitants, who are dispersed over an expanse of country equal in size to that of England. *Loreto*, the chief place of California, is a little town with a *presidio*, or military post. The inhabitants, Spaniards, Mestizos, and Indians, may perhaps amount to 1000 individuals, and it is the most populous place of all California.

Before the arrival of the missionaries, the indigenous natives of Old California lived in the lowest state of degradation. Like the lower animals, they would pass whole days lying stretched out upon their belly in the sand; and like beasts of prey, when pressed by hunger, they would fly to the chase merely to satisfy the wants of the moment. A sort of religious horror, nevertheless, made them believe in the existence of a great Being, whose power they dreaded. The *Pericues*, *Guaicurua*, and the *Laymones*, are the principal tribes.

The first missions of Old California were formed in 1698 by the Jesuits. Under the management of these Fathers, the savages had abandoned their wandering life. In the midst of arid rocks, of brush-wood and bramble, they had cultivated little spots of ground, had built houses, and erected chapels, when a despotic decree, as unjust as it was impolitic, came to banish from every part of Spanish America this useful and celebrated society. The governor, Don Portola, sent into California for the purpose of executing this decree, imagined that he was to find vast treasures, and to encounter 10,000 Indians armed with muskets, prepared to defend the Jesuits; far, however, from this being the case, he beheld only venerable priests, with silver-white hair, coming humbly forward to meet him. He shed generous tears for the fatal error of his king, and as far as lay in his power softened the execution of his orders. The Jesuits were accompanied to the place of their embarkation by the whole body of their parishioners, in the midst of sobs and exclamations of sorrow.^c The Franciscans immediately succeeded them in Old California, and in 1769 extended their pacific conquests over New California. Still later, the Dominicans obtained the government of the missions in the former of these provinces, but have either neglected them, or managed them unskillfully. The Franciscans, on the contrary, constitute the happiness of the Indians. Their simple dwellings have

a most picturesque appearance. There are many of them concealed in the interior of the country, far from the military posts. But their safety is insured by the universal respect and love with which they are treated.

Many French writers, and, among others, the Abbe Raynal, have spoken in pompous terms of what they term *The Empire of New Mexico*; and they boast of its extent and riches. Under this denomination they appear to comprehend all the countries between California and Louisiana. But the true signification of this term is confined to a narrow province, which, it is true, is 175 leagues in length, but not more than thirty or forty in breadth. This stripe of country, which borders the Rio del Norte, is thinly peopled; the towns of *Santa Fé* containing 4000 inhabitants, *Albuquerque*, 6000, and *Taos*, 9000, comprise almost one half of the population. The other half consists of poor herdsmen, whose scattered hamlets are frequently ravaged by the powerful tribes of Indians who surround or overrun the province. It is true, that the soil is amongst the finest and most fertile of Spanish America. Wheat, maize, and delicious fruits, especially grapes, grow there abundantly. The environs of *Passo del Norte*, produce the most generous wines. The mountains are covered with pines, maples, and oaks. Beasts of prey are met with in great numbers. There are also wild sheep, and particularly elks, or at least large deer, fully the size of a mule, with extremely long horns. According to the Dictionary of *Alcedo*, mines of tin have been discovered. There are several hot springs. Rivers, with a saline taste, indicate the existence of rich beds of rock salt. The chain of mountains that borders New Mexico, on the east, seems to be of a moderate degree of elevation. There is a pass through it, called *Puerto de Don Fernando*, by which the Paducas have penetrated into New Mexico. Beyond this chain extend immense prairies, on which buffaloes and wild horses pasture in innumerable herds. The Americans of the United States hunt these animals, and sometimes pursue them to the very gates of Santa Fé. The principal mountains follow the western bank of the Rio del Norte. Some peaks, or *cerros*, are there to be distinguished. Further to the north, in the country of *Nabaho*, the map of Don Alzate has traced mountains with flat summits, denominated in Spanish *mesas*, that is, *tables*.

The calcareous nature of the soil appears to be established by an event of a rather extraordinary nature in the annals of physical geography. In 1752, the inhabitants of *Passo del Norte* beheld the bed of the great river all at once become dry, along a tract of fifty leagues. The water of the river precipitated itself into a fissure recently formed, and only issued again from the earth near the presidio of *St. Eleazar*. The Rio del Norte disappeared in this manner for several weeks; but at length the water resumed its former course, because no doubt the fissure and the subterranean passages had been choaked up.^d

The Spanish inhabitants of New Mexico, as well as those of New Biscay, and of the greater part of the *Provincias Internas*, live in a state of perpetual war with the neighbouring Indians. These Spaniards never travel but on horseback, always armed and prepared for combat. They live in a colder climate than that of Mexico; the winter, which often covers their rivers with thick ice,

^a *Ovis montana*, Rocky Mountain sheep.

^d Manuscript Journey of the Bishop Tamaron, consulted in Mexico by M. A. de Humboldt.

hardens their fibres and purifies their blood; and they are generally distinguished for their courage, their intelligence, and their love of liberty.

The same moral attributes extend to the greater part of the Indian tribes that border on New Mexico.

The *Apaches* originally inhabited the greater part of New Mexico, and are still a warlike and industrious nation. These implacable enemies of the Spaniards infest the whole eastern boundary of this country, from the Black Mountains to the confines of Cohahuila, keeping the inhabitants of several provinces in an incessant state of alarm.^a There has never been any thing but short truces with them; and although their number has been considerably diminished by wars and frequent famines, the Spaniards are obliged constantly to keep up an establishment of 2000 dragoons, for the purpose of escorting their caravans, protecting their villages, and repelling these attacks, which are perpetually renewed. At first the Spaniards endeavoured to reduce to slavery those who, by the fate of war, fell into their hands; but seeing them continually surmount every obstacle that opposed their return to their dear native mountains, their conquerors adopted the expedient of sending their prisoners to the island of Cuba, where, from the change of climate, they speedily perished. No sooner were the *Apaches* informed of this circumstance, than they refused any longer either to give or receive quarter. From that moment, none have ever been taken prisoners, except those who are surprised asleep, or disabled during the combat.

The arrows of the *Apaches* are three feet long, and are made of reed or cane, into which they sink a piece of hard wood, a foot long, with a point made of iron, bone, or stone. They shoot this weapon with so much force, that at the distance of 300 paces they can pierce a man. When the arrow is attempted to be drawn out of the wound, the wood detaches itself, and the point remains in the body. Their second offensive weapon is a lance, fifteen feet long. When they charge the enemy, they hold this lance with both hands above their head, and, at the same time, guide their horse by pressing him with their knees. Many of them are armed with firelocks, which, as well as the ammunition, have been taken in battle from the Spaniards, who never sell them any. The archers and fusileers combat on foot; but the lancers are always on horseback. They make use of a buckler for defence. Nothing can equal the impetuosity and address of their horsemen. They are thunderbolts, whose stroke it is impossible to parry or escape.

We must cease to feel astonished at the invincible resistance which the *Apaches* oppose to the Spaniards, when we reflect on the fate to which they have subjected those other Indians who have allowed themselves to be converted.

The *Keres*, who at present form the population of San Domingo, San Felipe, and San Diaz, were one of the most powerful of the twenty-four ancient tribes that formerly occupied New Mexico. They are of a tall stature, with a full figure; and possess a mild and docile disposition. They are become the vassals, or to speak more correctly, the slaves of government, which imposes on them various services, such as that of carrying burthens, or

driving mules; or they are even subjected to military service, where they are treated with all the barbarity which a white man is capable of exercising.

The countries that separate New Mexico from the two Californias are only known through the pious exertions of some Missionaries. In the seventeenth century, the *Nabaja* and *Moqui* Indians had submitted to the Missionaries; a general insurrection, however, in 1680, terminated in the massacre of these apostles of civilization. In the last half of the eighteenth century, Father Escalante penetrated as far as two great lakes, which appeared to empty themselves on the coast of New California. The water of one of them was salt. The whole of this country seems to be a plateau, little differing from that of New Biscay. One river takes its name from small pyramids of sulphur, with which its banks are covered. The *Rio Colorado* appears to flow through a fertile country, a part of which is cultivated by industrious Indians. The *Raguapiti*, the *Yutas*, and the *Yabipai*, and especially the *Moquis*, enjoy a sort of civilization. The latter live on the banks of the *Yaguesila*, which falls ultimately into the Colorado. Father Garces found in their country a town very regularly built, containing houses of several stories, and large public squares. Farther south, on the banks of the Rio Gila, the same Missionary discovered the ruins of a large town, in the middle of which was a kind of strong castle, with its sides exactly directed to the four cardinal points. The Indians who live in the neighbourhood of these memorable ruins, inhabit populous villages, and cultivate maize, cotton, and calabashes.^b These traces of ancient civilization correspond with the traditions of the Mexicans, who affirm that their ancestors repeatedly halted in these regions after leaving the country of Aztlan. Their first station was on the banks of the lake Teguyo; their second, on the Rio Gila; their third, in New Biscay, near the *presidio* of Yanos, where there are likewise the ruins of edifices, called by the Spaniards *casas grandes*.^c

To the east of the gulf of California extend fertile, agreeable, and salubrious countries, but which are still very little known, and thinly inhabited. They are comprised in the intendency of Sonora.

Pimeria is the country inhabited by the Pimas. The Missionaries have succeeded in reducing this tribe to subjection and civilization. This part of Mexico abounds in gold dust. The *Seris*, a name that recalls to our recollection a famous nation of Asia, still resist the European yoke. On the Spanish maps, the name of New Navarre appears to comprehend the three provinces of Sonora, Hiaqui, and Mayo. There are very rich mines here. From those of Sonora gold is obtained. The country is very fertile, and is well watered by considerable rivers. That of Hiaqui is the principal one. The town of *Arispe*, the seat of the intendency, and that of *Sonora*, contain 7000 or 8000 inhabitants.

The province of *Cinaloa*, better peopled and better cultivated than the preceding ones, contains some important towns, such as Cinaloa itself, with nearly 10,000 inhabitants; *Hostimuri* and *Alamos* with rich mines. To the south of this province extends that of *Culiacan*, of which the capital, the seat of an ancient monarchy, is peopled with nearly 11,000 inhabitants. On the coasts

^a Pike's Journey in Louisiana, &c. II. p. 95. 101. 103. French translation.

^b Cronica Serafica de el Collegio de Propaganda Fede de Queretaro, Mexico, 1792, quoted by A. de Humboldt, II. p. 392. 396. 410.

^c Great houses.

of this province, forests of guava, lemon, and orange trees, begin to be frequent, and the *lignum vitæ*, and palm, also grow there; but in the interior there are cold and arid mountains.^a

The great mountain chain which composes the spine of Mexico, traverses throughout its whole length the province of *New Biscay*, or the intendency of Durango. Craters of volcanoes, and a mass of iron resembling the stones that have fallen from the atmosphere, excite the attention of the naturalist. The mines of silver are both numerous and rich. The greater part of the country presents the appearance of a barren and sandy plateau. Several of its rivers, not meeting with a favourable declivity for obtaining an outlet, have spread themselves into lakes. The winters, which are often severe, are followed by suffocating heats. Scorpions are spoken of as one of the scourges of the country, their sting proving fatal in a few hours.^b

Durango, one of the most southern towns of *New Biscay*, is the capital. It contains 12,000 inhabitants.^c Almost as many are assigned to *Chihuahua*, (or *Chigagua*,) the residence of the Captain-General of the *Provincias Internas*. This town is adorned with some magnificent edifices. *Batopilas* and *Cosigirachui*, mining towns, contain from 8,000 to 10,000 inhabitants. The Spaniards of this province, always in arms against the Indians, possess an enterprising and warlike character. The *Cumanches*, the most formidable of the natives, equal the Tartars in the rapidity of their incursions on horseback. They make use of dogs as beasts of burthen. None of the Indians of this province have been reduced to subjection.

The province of *Cohahuila*, which is sometimes visited with scorching winds, abounds in corn, in wine, and in cattle. *Monclova* is an elegant town; and *Santa Rosa* possesses rich mines of silver. A little province, containing the town of *Monterey*, has preserved to itself the pompous title of the *new kingdom of Leon*, which appears to have been intended to comprehend all the north-eastern provinces. Great plains, covered with palm trees, and adapted for the cultivation of sugar and of indigo; some heights waving with oaks, magnolia, and the other trees of Louisiana; a low coast, intersected by numerous lagoons and bays, which vessels are prevented from entering by a bar of sand: such is the general description of the province of *Texas*, and that of *New Santander*. Not far from the town of Santander, the port of *Soto la Marina*, were it properly attended to, might become of some importance to this fertile but desert country. *San Antonio de Bejar*, a village composed of mud cabins covered with turf, is the chief place of the province of *Texas*, so much coveted by the Anglo-Americans, and which has officially received the name of *New Estramadura*. Some indications of mines, forests similar to those on the banks of the Ohio, a rich soil, and, generally speaking, a healthy climate, attract American adventurers hither. But in order to ascertain the value of this province, it would be necessary, by new researches, to discover if the rivers, limpid, deep, and abounding with fish, by which it is watered, are all of them, without exception, rendered inaccessible from the sea, by the bar of sand which extends along the

coast. M. de la Salle, who, in 1685, attempted to form an establishment in the bay of *St. Bernard*, did not find himself opposed by this obstacle.

The province of *San Luis de Potosi*, to the south-west of *New Santander*, contains the town of the same name, the seat of an intendency, and peopled by 12,000 inhabitants. The silver mine of *Real de Catorce*, discovered in 1773, annually produces from 750,000*l.* to 833,000*l.* sterling.^d It is the mine nearest to Louisiana.

To the south-west of the preceding provinces, extend the two intendancies of *Zacatecas* and *Guadalaxara*, forming together the kingdom of *New Galicia*. The indigenous name of the country was *Xalisco*. It was inhabited by a warlike race, who sacrificed human beings to an idol in the form of a serpent, and who even, according to the allegation of the first Spanish conquerors, devoured these wretched victims after making them perish in the flames.^e This kingdom, twice the size of Portugal, does not contain a population equal to that of Norway. *Zacatecas*, a very elevated and very mountainous country, contains a town of the same name, inhabited by thirty-three thousand individuals. At no great distance are nine lakes, which are covered with an efflorescence of muriate and carbonate of soda. Its mountains, composed of sienite, contain some of the richest veins in the world.^f

Guadalaxara may perhaps contain thirty thousand inhabitants, exclusive of Indians. It is the see of a bishop, and contains a university and a superior tribunal. The *Rio San Juan*, likewise called *Tololotlan* and *Barania*, on issuing from Lake Chapala, forms a very picturesque cataract.^g

Compostella is the chief place of a district, abounding in maize, cocoa-nut trees, and cattle. *Tonala* manufactures pottery for the consumption of the province.^h *La Purificacion* is likewise noticed as a considerable town, and the chief place of the southern part of *New Galicia*. Cochineal and sugar are its chief productions. At some distance to the north-west, is *Cape Corrientes*, a boldly projecting point. The winds and currents appear to change their direction at this celebrated promontory.

The port of *San Blas*, almost uninhabitable on account of its insalubrity and its extreme heat, is surrounded by beautiful forests, the wood of which is made use of for the royal navy, which has here its principal establishment.

The two intendancies of *Guanaxuato* and *Valladolid*, constitute the ancient kingdom of *Mechoacan*, which was independent of the Mexican Empire.

This kingdom, the name of which signifies the country *abounding in fish*,ⁱ contains volcanoes, hot and sulphureous springs, mines, and peaks of mountains white with perpetual snow; it is notwithstanding one of the most agreeable and fertile countries that can possibly be beheld. Numerous lakes, forests, and cascades, diversify the prospect. The mountains, covered with wood, leave a space for meadows and fields. The air is healthy, except on the coast, where the Indians alone can resist the humid and suffocating heat.

Of all the Americans, the natives of this country were the most dexterous marksmen with the bow and arrow.

^g Chappe de Auteroche, Voyage, p. 32.

^h Alcedo, Diccionario, at the word Tonala.

ⁱ Gomara, Nueva España, cap. 147.

The kings of Mechoacan formerly received their principal revenues in *red feathers*, of which carpets and other articles were manufactured. This curious trait calls to our recollection the inhabitants of Tongataboo. At the funeral of their kings, they immolated seven females of noble family, and an immense number of slaves, for the purpose of ministering to the deceased in the other world.^a At the present day however, the Indians, and especially the *Tarasas*, devote themselves to the labours of a peaceful industry.

Valladolid, the ancient Mechoacan, a very pretty town, and enlivened by considerable commerce, enjoys a delicious climate, and contains a population of eighteen hundred souls. The village of *Tzinzontzan*, on the picturesque shores of the lake of Pazuaro, was the residence of the ancient kings of Mechoacan.

Guanaxuato, a large town, of more than seventy thousand inhabitants, flourishes principally by its silver mines, the richest in Mexico. The mine of the Count de Valenciana was already, in 1804, nineteen hundred and sixty English feet^b in perpendicular depth, which makes it the deepest mine at present existing on the face of the globe. The profits of this single mine amount to from 125,000 to 250,000 pounds sterling.^c

The town of *San Miguel el Grande* is engaged in an extensive trade in cattle, skins, cotton cloth, swords, knives, and other works in very fine steel.^d *Celaya*, the chief place of a district, which produces two kinds of pepper, has recently had a magnificent church built in it by the Carmelites, and ornamented with Corinthian and Ionic colonnades.^e

The intendency of *Mexico*, the principal province of the empire of Montezuma, formerly extended from one sea to the other; but the district of Panuco having been separated from it, it no longer reaches the gulf of Mexico. The eastern part, situated on the plateau, contains several valleys of a round figure, in the centre of which there are lakes, at present of small extent, but whose waters appear formerly to have filled these basins. Drained and deprived of its wood, this plateau is at once subject to an habitual aridity, and to sudden inundations, occasioned by heavy rains and the melting of the snows. Generally speaking, the temperature is not so hot as it is in Spain; in fact, it enjoys a perpetual spring. The mountains with which it is surrounded still abound in cedars and other lofty trees, in gums, drugs, salts, metallic productions, marbles, and precious stones. The flat country is covered the whole year through with delicate and exquisite fruits, flax, hemp, cotton, tobacco, aniseed, sugar, and cochineal, with which they support an extensive commerce.

Besides the numerous volcanoes of which we have already spoken, some natural curiosities are met with. One of the most remarkable is the *Ponte-Dios*, or the bridge of God, a rock, under which the water has hollowed itself a passage, situated about 100 miles to the south-east of Mexico, near the village of Molcaxac, on the deep river Aquetoyac. Along this natural bridge, the traveller may continue his journey as if he were on a high road. Several cataracts present a romantic appearance. The great cavern of Dante, traversed by a river; the porphyritic organ-pipes of Actopan; and many other singular objects,

excite the astonishment of the traveller in this mountainous region, where he is obliged to cross foaming rivers upon bridges formed of the fruit of the *Crescentia pinnata*, tied together with ropes of agave.

On the very ridge of the great Mexican plateau, a chain of porphyritic mountains encloses an oval valley, the general level of which is 6700 feet above the surface of the ocean. Five lakes fill the middle of this valley. To the north of the united lakes of Xochimilco, and Chalco, in the western part of the lake of Tezeuco, once stood the ancient city of *Mexico*, to which the traveller arrived by causeways constructed in the shallow waters of the lake. The new city, although placed on the same spot, is situated on the main land, and at a considerable distance from the lakes, the waters of which have retired; it is intersected by numerous canals, and the houses are erected on piles. The draining of the lakes is still continued, by means of a canal which has been opened for that purpose, through the mountains of Sincoq, in order to protect the town from inundations. In many places, however, the ground still yields, and some buildings, amongst others the cathedral, have sunk six feet. The streets are wide and straight, but badly paved. The houses present a magnificent appearance, being built of porphyry and amygdaloid. Several palaces and private mansions have a majestic effect, and its churches glitter with metallic riches. The cathedral surpasses, in this respect, all the churches in the world. The balustrade which surrounds the great altar is composed of massive silver. A lamp of the same metal, is of so vast a size, that three men go into it when it has to be cleaned; and it is enriched with lions heads, and other ornaments, of pure gold. The statues of the Virgin and the saints are either made of massive silver, or richly gilded, and ornamented with precious stones. Palaces, private mansions, beautiful fountains, and extensive squares, adorn the interior of this city. To the north of the city, near the suburbs, is the principal public promenade, or *Alameda*. Round this walk flows a rivulet, forming a fine square, in the middle of which there is a basin with a fountain. Eight alleys of trees terminate there, in the figure of a star. But by an unfortunate proximity, immediately in front of the alameda, the eye discovers the *Quemadero*, a place where the Jews, and other victims of the terrible Inquisition, were burned alive. This detestable tribunal was finally abolished by the ex-emperor Augustin Iturbide in 1820; and this same enterprising individual, who, during his short reign, formed Lancastrian schools over the empire, has been the cause of the fine building, formerly appropriated to its operations, having been converted at present into a polytechnic school.^f Although the city of Mexico is situated in the interior of the country, still it forms the centre of an immense commerce between Vera Cruz on the east, and Acapulco on the west. The shops are absolutely overflowing with gold, silver, and jewels. This superb city, inhabited by 140,000 people, is likewise distinguished by great scientific establishments, to which, in the New World, there is nothing similar. The *botanical garden*, the *school of mines*, the *academy of the fine arts*, which has produced excellent draughtsmen, painters, and sculptors,—these are the establishments that refute the prejudices of persons who

^e A. de Humboldt, II. 286.

^f Bullock, p. 150.

consider the Americans as inferior in natural capacity to Europeans.

The fine arts have, it seems, suffered incalculably by the revolution. There is not now a single pupil in the academy; and its late president is now old, and blind, and poor; nor could Mr. Bullock, by profession a collector, pick up above four specimens in all Mexico worth the carriage to Europe. This slight reverse of Humboldt's immortal picture of that country, is however agreeably compensated by another, the increased happiness of the lower orders, particularly of the Indians.^a In the evenings, during the dry season, the environs of the city present a scene of pleasure, gaiety, and bustle, scarcely to be paralleled; hundreds of canoes, on the canal of Chalco, of various sizes, mostly with awnings, crowded with native Indians neatly dressed, and their heads crowned with the most gaudy flowers, are seen passing in every direction; each boat, with its musician seated on the stern, playing on the guitar, and some of the party singing, dancing, or both united, presents such a picture of harmless mirth, "as I fear," says Mr. Bullock, "is rarely to be met with at the fairs and wakes of our own country. Revolution has had its usual operation here; it has reduced the overgrown, but insecure wealth of the rich, to an independent protected competence; but it has also wiped away the tears, and broken the chains which galled the innocent people whose labours had amassed it."^b

Humboldt saw erecting, in the great square of Mexico, a colossal equestrian statue, in bronze, of the king of Spain, by M. Tolza, "a statue," says he, "which, by its imposing mass, and the noble simplicity of its style, might adorn the first cities of Europe." Even by the admission of the Spanish authors, balls, and games of hazard, are pursued with ardour, while the more noble enjoyments of the drama are less generally relished. To vivid passions the Mexican Spaniard adds a great fund of stoicism. He enters a gaming-house, loses all his money upon a single card, and then takes his *segar* from behind his ear, and smokes as if nothing had happened.^c

The floating gardens, or *Chinampas*, a kind of raft, upon which flowers and vegetables are cultivated, give a singular appearance to the Mexican lakes, but their number diminishes every day. Yet with all this civilization, the mechanical arts thrive rather as encouraged by the profusion of wealth among the rich, than from inherent improvement. The use of the great saw is still unknown, and the modern Mexicans, like the Greeks in the days of Homer, are ignorant that one tree can afford more than one plank, or of other means of procuring this than by the hatchet. Their work in gold and silver-chasing, and the like, is all performed by the hand; and even the minting process is described as excessively awkward and tedious. Many of their best mines have been deserted from want of skill in the proper means of exhausting their water; and companies have been formed in England, on the Rhine, and in America, besides many private individuals, such as the ingenious traveller from whom we derive our information, who calculate on realising fortunes by more judicious operations. The ascent from Vera Cruz to Perote is so steep as to require nineteen mules to draw

the beam of a steam engine; but the enterprise of the above individuals is daily multiplying this powerful auxiliary to the miners in the empire of Mexico.^d

Mexico preserves few monuments of antiquity. The ruins of aqueducts; the stone of sacrifice, and the calendar stone, both of which are placed in the great square of the city; manuscripts or hieroglyphical pictures, badly preserved in the archives of the vice-regal palace; and finally, the colossal statue of the goddess *Teoyamiqui*, lying on its back in one of the galleries of the University, are all that remains worthy of notice in this city. But to the north-east of the city and of the lake Tezcucoc, on the hills of *Teotihuacan*, are seen the imposing remains of two pyramids, consecrated to the sun and moon, and, according to some historians, constructed by the *Olmecs*, an ancient nation that came to Mexico from the east, that is to say, from some country situated on the Atlantic Ocean.^e The pyramid, or house of the sun, (*Tonatiuytzaqual*), is 171 feet high, and its base measures 645 feet; that of the moon, (*Meztli-yltzaqual*), is thirty feet smaller. These monuments appear to have served as models for the *Teocallis*, or houses of the gods, constructed by the Mexicans in the capital and other parts of the country: but the pyramids are incased by a thick wall of stone. They formerly supported statues covered with very thin plates of gold. Numerous small pyramids, which appear to have been dedicated to the stars, surround the two great ones. Another ancient monument worthy of attention, is the military intrenchment of Xochialco, not far from the town of Cuernavaca. This also is a truncated pyramid of five courses, surrounded by ditches, and faced with rocks of porphyry, upon which, amongst other pieces of sculpture, are to be distinguished figures of men, seated with their legs crossed, in the Asiatic fashion.^f All these pyramids exactly face the four points of the compass.

In that part of the province which is situated to the north-east of the capital, the town of *Queretaro*, peopled by 30,000 or 40,000 inhabitants, rivals the finest cities of Europe in the architecture of its edifices. It is enriched by the manufacture of cloth and morocco leather. Formerly, according to the tradition of the Indians, *Tula*, or *Tollan*, was inhabited by giants. The bones that are found there are no doubt the remains of some great quadruped.

In the southern part of the province we first of all meet with *Toluca*, where our admiration is excited by a very old tree of the species denominated *Cheirostæmon*, or the hand-tree, a member of the Malvaceæ. The extraordinary shape of its flowers, imitating the figure of a hand, and its enormous magnitude, rendered it an object of curiosity to the Indians. But it is not a solitary specimen, as was imagined, for the species is spread over the mountains of Guatimala. *Tasco* boasts of an elegant parish church, built and endowed by Joseph de la Borde, a Frenchman, who had accumulated immense wealth by working the Mexican mines. The mere construction of this edifice cost him two millions of francs. Reduced some time afterwards to extreme poverty, he obtained from the Archbishop of Mexico permission to sell to the Metropolitan church of the capital, the magnificent *sun*, ornamented with dia-

monds, which, in happier times, he had consecrated to the tabernacle of his church at Tasco. These reverses of fortune, improbable as they would be in a romance, are, nevertheless, common in Mexico.

On the shores of the Pacific Ocean, under a burning sky, we find the two ports of *Zacatula* and *Acapulco*. An opening in the mountains, by giving access to the winds from the north, has diminished the unhealthiness of the latter of these ports, one of the finest in the world.

The province of *Puebla de los Angeles* likewise bears the name of *Tlascalala*, from the ancient republic which maintained itself there, independent of the despots of Mexico. The territories of this republic, and that of *Cholula*, contain monuments of ancient civilization. The truncated pyramid of Cholula, a hundred and seventy-two feet in height, on a base of thirteen hundred and fifty-five feet in length, is constructed of brick. To form an idea of the size of this monument, let us figure to ourselves a square four times larger than the *Place Vendome* at Paris, covered with a pile of bricks, which rises to double the height of the Louvre.^a This pyramid formerly supported an altar, consecrated to *Quetzalcoatl*, or "the god of the air," one of the most mysterious beings of the Mexican mythology. This deity, according to the traditions of the Aztecs, was a white man with a beard, like the Spaniards, who were imagined by the unfortunate Montezuma to be his descendants. *Quetzalcoatl* was the founder of a sect, who devoted themselves to severe penance, a legislator, and the inventor of several useful arts; but he could not, at last, resist an anxious desire which he felt to revisit his native country, called *Tlapallan*, probably identical with the *Huehue-Tlapallan* country, from which the Toltecs derived their origin.^b

The intendency of Puebla, very populous, and very well cultivated in its mountainous region, presents, towards the Pacific Ocean, vast countries, altogether abandoned, notwithstanding their natural fertility. The last poor remains of the Tlapanecs, inhabit the environs of Tlapa. In the populous part is situated the capital, *La Puebla de los Angeles*, or the "City of the Angels;" the fourth town in all Spanish America in respect of its population, which is estimated at 68,000 individuals. Glass, and armourers' cutlery, such as swords, bayonets, &c. are manufactured here. The town of Tlascalala was formerly a species of federative republic. Each of the four hills, on which it was built, had its own Cacique or war-chief; but these depended on a senate chosen by the whole nation. The subjects of this republic are said to have amounted to 150,000 families. This nation, which enjoys some peculiar privileges, is at present reduced to 40,000 persons, who inhabit about a hundred villages. One would almost feel disposed to think that a fatal destiny avenges on their heads the crime of having assisted Cortez in subjugating the independence of Mexico. *Cholula*, a sacred town anterior to the conquest, reckons a population of 16,000 souls. The environs of *Zacatlan* are peopled by the nation of the Totonacs. Like the Tlapanecs, these indigenous natives speak a language entirely different from that of the Mexicans, or Aztecs. They had adopted the barbarous and sanguinary mythology of the Mexicans; but a sentiment

of humanity had made them distinguish, as being of a different race from the other Mexican divinities, the goddess *Tzintéotl*, the protectress of harvests, and who alone was satisfied with a simple offering of fruits and flowers. According to a prophecy current amongst them, this peaceful divinity was one day to triumph over the gods that were intoxicated with human blood. The introduction of Christianity has verified the prediction. Tezcuco, the Athens of ancient Mexico, and still affording a rich and almost unexplored field to the antiquary, in the number and richness of its ruined palaces, baths, and pleasure grounds,^c contains 5000 inhabitants, only a tenth part of its population before the conquest. At *Atlixco*, the curiosity of the traveller is excited by an enormous cypress of seventy-three feet in circumference, and consequently, almost equal in magnitude to the famous Baobab of Senegal, which it surpasses in the beauty of its form.^d

The intendency of *Vera Cruz* embraces a strip of maritime districts, the lowest part of which, almost a desert, contains little else than sands and marshes, placed under a burning climate. In the province of *Guasteca*, we meet with the town of *Panuco*, situated on a navigable river, at the mouth of which is the port of *Tampico*, obstructed like all the rest on that coast by sand banks.

In the thick forests of *Papanila*, on the sides of the Cordilleras, rises a pyramid of a still more beautiful form than those of Teotihuacan and Cholula. It measures nineteen and one half yards in height, upon a base of twenty-eight yards,^e and is constructed of porphyritic stones, very regularly chiselled, and covered with hieroglyphics.^f

The beautiful town of *Vera Cruz*, the centre of a wealthy trade, which, in time of peace, Mexico keeps up with Europe, owes nothing to the kindness of nature. The rocks of madrepora, of which it is built, have been taken up from the bottom of the sea. The only water fit for drinking, is collected in cisterns. The climate is hot and unhealthy; arid sands surround the town to the north, while, to the south, the weary eye has nothing to rest on but ill-drained marshes. The harbour, which is insecure, and of difficult access, is protected by the fort of *St. Juan d'Ulua*, which is built on a rocky islet at immense expense. The population, estimated at 16,000 inhabitants, is often swept away by the yellow fever. To enjoy refreshing coolness, and all the charms of nature, the rich inhabitants often repair to *Xalapa*, a considerable town, situated on one of the terraces by which the central plateau sinks towards the Gulf of Mexico. This town has given its name to the medicinal root denominated Jalap. The fortress of Perote, looked upon as one of the keys of Mexico, is situated in the environs of Xalapa.

The province of *Tobasco*, the most southern portion of the intendency of Vera Cruz, is covered with forests, which produce dye woods, and resound with the roar of the Mexican tiger. In the cultivated spots, which are but thinly scattered, maize, cacao, tobacco, and pepper, are produced:

The intendency of *Oaxaca*, called also *Guazaca*, after an Indian town, contains the two ancient countries of the *Mixtecs* and the *Zapotecs*. This fertile and salubrious re-

gion abounds in mulberry trees, cultivated for the sake of the silk worm. A great deal of sugar, cotton, corn, cacao, and other fruits, grow there; but cochineal constitutes its principal riches. Its granitic mountains conceal mines of gold, silver, and lead, which, however, are neglected. Several rivers bring down gold dust, which the women are employed in collecting. Rock-crystal is likewise met with. *Guaxaca*,^a otherwise called Antequera, is a town of 24,000 inhabitants, situated in the delicious valley which Charles the Fifth bestowed on the descendants of Cortez, with the title of the Marquisate de Valle.^b Very fine wool is obtained here, and excellent horses crowd its rich pastures, which are watered by a beautiful river, and refreshed by a temperate and humid atmosphere. At the mouth of the river Guaxaca they have established a dockyard for the building of vessels.

Tehuantepec has a harbour on the Pacific Ocean, which, in spite of its natural disadvantages, derives importance from being the central depot between Mexico and Guatemala. The ruins of edifices at *Mila* indicate a very advanced state of civilization. The walls of the palace are decorated with what architects denominate the *Grecian scroll*, and *labyrinths* or *meanders*, executed in Mosaic, the design of which resembles what we see on the vases named Etruscan. Six unfinished columns of an imposing magnitude, that have been found here, are the only ones that have been hitherto discovered among the monuments of America.^c

The peninsula of *Yucatan*, or the Intendency of Merida, is little better known now than it was in the sixteenth century. Hernandez and Grijalva found it peopled by a civilized nation, who were dressed with some degree of luxury, and inhabited houses built of stone. They were possessed of instruments, vases, and ornaments made of gold. Some of these articles were adorned with a species of Mosaic, executed in turquoise. Their *Teocallis* were bathed with the blood of human victims.^d The indigenous natives speak the *Maya* language.

The country, which is very flat, is traversed, it is said, by a chain of low hills; and the climate is hot, but dry and healthy. This district abounds in cochineal and logwood; and in honey, wax, and cotton, from the latter of which they manufacture a good deal of printed cloth. But logwood is the principal object of commerce. On the coast, a considerable quantity of ambergris is picked up.^e The shores of this peninsula are edged, as it were, with a sand bank, which sinks with very great regularity at the rate of one fathom per league.^f The maritime districts every where present a flat and sandy country. There is only a single chain of elevated land, which terminates in a promontory between Cape Catoche and Cape Desconocida.^g The coasts are covered with mangroves, interwoven together by impenetrable hedges of althea and bamboo; and the soil is filled with sea shells. The droughts in the flat country commence in February, and soon become so general, that not a drop of water is any where to be seen. Their only resource is the wild pine, which, in its thick and spreading foliage, preserves some moisture; and water is drawn from it by incision.^h On the northern coast, at the mouth of the river Lagaitos, at the distance of 400

yardsⁱ from the shore, the navigator is astonished to perceive springs of fresh water rising up in the midst of the salt waves. These springs are called the Mouths of *Conil*.^k

Merida, the capital of the province, is a town containing 10,000 persons, inhabited by a nobility who are far from being rich. The town of *Campeachy* carries on a little trade with the salt extracted from its salt works, some cotton cloth, and logwood. The island of *Cozumel*, or, more properly, *Acucemil*, was celebrated for an oracle, to which the people of the continent repaired in crowds. Before the arrival of the Spaniards, the natives worshipped a wooden cross, the origin of which was unknown. It was invoked to procure rain, the chief want of this arid island.^l

We have distinguished on our maps, under the name of *English Yucatan*, that part of the peninsula which lies to the south of the river *Hondo*, and of the Spanish military post of *Salamanca*. This country, better watered and more fertile than the rest of the peninsula, is inhabited by independent Indians. The English, however, cut logwood and mahogany there, and have built the town of *Balize*, which is the residence of a titular Indian king, who receives the commission of his appointment from the government of Jamaica, and is installed by the English garrison. The islands of *Rattan*, *Turneff*, and others, washed by the singularly transparent waters of the Gulf of Honduras, are occupied by small English colonies.^m

The name of *Guatemala*, or, more correctly, *Quauhite-mallan*, that is to say, the place full of trees, originally belonged to a single district. The Spaniards have applied it to a captain-generalship, which bears the title of kingdom, and to one single province, comprehended within this kingdom.

The province of Guatemala, properly so called, extends from the confines of Guaxaca to those of Nicaragua, along the Pacific Ocean. The climate in general is hot and moist. The plains are fertile, both in American and European fruits of a delightful flavour. Maize produces 300 for one, as well as the cacao, with which they supply the whole kingdom of New Spain. Indigo of a superior quality is produced there, and the annatto is cultivated. The forests with which the mountains are covered give shelter and food to animals that are still imperfectly known; and many nondescript shrubs are met with, from which flow valuable balsams. Many ports on the South Sea afford this province great facility for carrying on an advantageous commerce with Peru, Terra Firma, and New Spain. The coasts abound with fish, but fishing is not followed with any considerable activity. They likewise neglect their silver mines, which are said to be rich; but they collect the sulphur that floats on the surface of several lakes. The whole province is filled with volcanoes, and exceedingly subject to earthquakes.

Guatemala is the capital both of the province and kingdom of that name; and is the see of an archbishop, and the seat of a University. The old city was destroyed on the 7th June, 1777, by one of the most tremendous earthquakes of which we have any record. On the 3d of June, the agitated sea rose from its bed; the two volcanoes adjacent to the town appeared to boil; one of them poured

out torrents of water, the other floods of burning lava. On every side the earth was seen to gape in deep fissures. At length, after five days of unutterable anguish, the abyss opened, and the city, with all its riches, and 8000 families, was instantly swallowed up, while torrents of mud and sulphur, rushing over the ruins, obliterated for ever all vestiges of its former existence. The spot is now indicated by a frightful desert. The new city is built at the distance of four leagues from the site of the old town. We must not omit noticing *Amatilan*, or the town of letters, so called in consequence of the talent which the Indians, its inhabitants, displayed for carving hieroglyphics on the bark of trees. The district of *Soconusco*, of which the chief place is *Gua-guettlan*, produces the best cacao of all America; but very little of it is met with in commerce.^a In the district of *Quesaltenango*, very fine alum and sulphur are found. *Solola* produces the best figs in the kingdom, and a good deal of cotton is spun there. Two volcanoes are met with in the district, the one called *Atilan*, and the other *Solola*.^b The district of *Suchitepec*, fertile in annotto, is subject to excessive rains.

In the interior of the kingdom of Guatemala, is situated the province of *Chiapa*. The Indians of Chiapa formed a state which was independent of the emperors of Mexico. This republic perhaps merited the second place after that of Tlascalala, for its progress in civilization, and more especially for its manufacturing industry. The Chiapanese adopted the calendar and chronological system of the Mexicans; but their mythology was distinguished by a deified hero named *Votan*, to whom one day of the week was consecrated.^c This is the only resemblance which this Chiapanese divinity bore to the *Wodan* of the Saxons, and the *Odin* of the Scandinavians. This people defended themselves with courage against the Spaniards, and obtained honourable terms of capitulation from their conquerors. Happily the soil of Chiapa is not rich in mines, a circumstance which has secured to the natives the preservation of their liberty, and the privileges which had been granted them. Modern travellers have not visited this isolated country, where, two centuries ago, Thomas Gage found a happy, social, and industrious people. *Chiapa dos Indios*^d reckoned four thousand families, while its woollen manufactories, its trade in cochineal, and its *naumachias*, or mock fights, celebrated on the river, all combined to render it an animated and delightful town. *Chiapa dos Españos*, tentimes less populous, was the seat of the governor and of an archbishop. These accounts are repeated in every geographical work for want of something better. It is proper, however, to make known their date.

A Spanish geographical dictionary gives recent and curious details respecting the province of *Vera Paz*, which, on the north, is bounded by Yucatan, and on the west, by Chiapa.^e The capital of Vera Paz is called *Coban*. It rains nine months in the year in this province; and the country abounds in fruits and flocks. In the forests very large trees are met with, from which a fragrant odour is diffused, and from which distils an odoriferous resin, which resembles amber. Different kinds of gum, balsam, incense, and dragon's blood, are also collected. Canes of a hundred feet long are found, and of such a thickness, that

from one knot to another twenty-five pounds of water are contained. The bees of this region make a very liquid honey, which, after becoming acid, is made use of, they say, instead of orange juice. The forests are full of wild animals, amongst which Alcedo distinguishes the *Tapir* or *Danta*. When enraged, this animal shows his teeth like the wild boar, and, it is asserted, cuts through the largest trees.^f Its skin is six fingers thick, and, when dried, resists every kind of weapon. Very large bears are also met with.

The province of *Honduras* is very little known. It extends from that of *Vera Paz* to that of *Nicaragua*. The first Spanish navigators perceiving a great number of pom-pions floating along the banks of the rivers, called it the Coast of *Hibueras*, that is to say, the Coast of Pom-pions. The most western part of this province contains the little Spanish towns of *Comayagua* and *Truxillo*. The latter of these has been built near a lake, where floating islands, covered with large trees, move from place to place at the discretion of the wind.^g Near the river *Sibun*, caverns have been discovered, or rather immense subterranean galleries, which run under several mountains, and appear to have been hollowed out by ancient currents.^h The interior of the country is inhabited by a savage and untractable nation, the *Mosquito-Sambos*. The coasts, especially near Cape *Gracios a Dios*, are occupied by another tribe of Indians, whom the English navigators denominate the *Coast Mosquitoes*. This appellation originates in the insupportable cloud of Mosquitoes, or stinging flies, that here torment the wretched inhabitants, and compel them to pass a part of the year in boats on the rivers. The Mosquito Indians of the coast, a tribe governed by aristocratic chiefs, do not reckon more than fifteen hundred warriors. We are unacquainted with their notions of religion; but, according to the older voyagers, they divided the year into eighteen months of twenty days each, and they termed the months *Ioalar*, that is to say, a moveable thing,—a very remarkable denomination, because it evidently approaches the word *Iol*, by which the ancient Scandinavians designated the festival that terminated the year,—a term which appears also to have signified a *wheel* or *cycle*. Similar divisions of the year into eighteen months prevailed among the Aztecs of Mexico.ⁱ Each month consisted of twenty days, and five complementary days were added at the end of the year, which was denominated *Cempohualihuitl*, from *cempohualli*, twenty, and *ilhuitl*, festival. The cacique of those Mosquitoes who inhabit the coast between Black River and Cape *Gracios a Dios*, lately sold^k or transferred that territory to a person of the name of Gregor Mac Gregor, who had attained some notoriety in the late Colombian struggle for liberty. His feeble attempts at colonising this dreary region have ended in disappointment, and in the total ruin of the settlers, many of whom sunk under the combined effects of climate and the horrors of despair. At Balize, the English keep up establishments, which render them masters of the country. In 1800 or 1801,^l the Spaniards attacked these posts, but found them too well defended and too well supplied to be taken by surprise, as they had vainly flattered themselves. It is to the unfortunate Colonel Despard, and

to the great Nelson, that England is indebted for the systematic arrangement which is established in these little colonies. In 1769 they exported 800,000 feet of mahogany, 200,000 lbs. of sarsaparilla, and 10,000 lbs. of tortoise shell, besides tiger and deer skins.

The province of *Nicaragua* would deserve, for itself alone, a more extended topographical account than we can devote to all Mexico together; but when recent and authentic materials are wanting, a judicious criticism would never think of idly repeating all the details that are met with in the older narratives. The elevation and direction of the mountains, in this part of the Mexican isthmus, are still very little known. According to the respectable testimony of Gomara,^a and almost all the accounts and maps that have been published, the great lake of Nicaragua, covered with beautiful and populous islands—amongst which only one contains a volcano, named *Omo*, that always continues burning—has no outlet towards the South Sea; all its waters descending by the river St. Juan, in the direction of the Atlantic Ocean. This river, the scene of Nelson's earliest exploits, forms about thirty inconsiderable falls before it reaches the marshy shores of the sea, where a pestilential air, and Indians, distinguished alike for their perfidy of character, and the ferocity of their disposition, fill the most intrepid navigators with alarm.^b The lake, then, is situated on a plateau, but at what elevation? "The coast of Nicoya," says Dampier,^c "is low, and covered with shrubs. To reach San Leon de Nicaragua, one must travel twenty miles across a flat country, covered with mangroves, pasture land, and plantations of the sugar cane." These remarks of a judicious observer, appear to indicate that there is no considerable chain of mountains between the Lake of Nicaragua and the Pacific Ocean.^d The physical geography of this country is unquestionably possessed of great interest, and yet it is totally neglected.

Among the numerous volcanoes of this country, that of *Masaya*, three leagues (Castilian) from Granada, and ten from Leon, appears to be the most considerable. Its crater, which is half a league in circumference, and 250 fathoms in depth, ejects neither ashes nor smoke. The burning matter, which is perpetually boiling within it, diffuses so intense a light through the air, that it is visible at more than twenty leagues. So much, in fact, does it resemble gold in a state of fusion, that the first Spaniards actually supposed it to be this metal, the object of their anxious search; and stimulated by their avaricious temerity, vainly attempted to seize, with iron hooks, some of this very singular lava.^e

No mines have as yet been discovered in the province of Nicaragua; but it is fertile in every description of fruits, and abounds in large and small cattle, especially in mules and horses. They also carry on a great trade in cotton, honey, wax, anise-seed, sugar, cochineal, cacao, salt, fish, amber, turpentine, and petroleum, together with different balsams and medicinal drugs. The palm trees grow to a colossal size. *Leon*, the capital, is situated on the margin of a lake, which empties itself into that of Nicaragua. Its inhabitants, rich, voluptuous, and indolent, derive but little advantage from the excellent port of *Realejo*, formed by a bay of the South Sea. The town of *Nicaragua*, not far

from the gulf of *Papagayo*; that of *Granada*, on the lake of Nicaragua; and that of *Xeres*, near the gulf of *Fonseca*, covered with wooded islands, have the reputation of being considerable towns; but we have no recent and authentic description of them.

The indigenous natives of Nicaragua speak five different languages. The *Choroteca* seems to be that of the principal indigenous tribe. It bears no kind of affinity with the Aztec or Mexican, which had been rendered common, previously to the arrival of the Spaniards, by the invasion of an Aztec colony. These new comers alone were possessed of books, composed of paper and parchment, in which they painted, in hieroglyphical figures, their sacred rites, and the political events of their country. It would appear that the Chorotecs did not understand writing. They reckoned eighteen months, and an equal number of great festivals. Their idols, different from those of the Aztecs, were, nevertheless, honoured by an equally sanguinary worship with that of Mexico; and in like manner the men also ate a part of the flesh of the women, children, and slaves, who had been immolated by their priests. Although liable to be offered in sacrifice, their women exercised great power.^f The Spaniards, on their arrival, discovered spacious palaces and temples, surrounded by commodious mansions for the nobility; but the common people lived in a state of great misery, and, in many places, had actually no other shelter than a kind of nest, fixed upon trees. Unwritten laws or customs, regulated the punishment for theft and adultery, as well as the sale of lands. The warriors shaved their head, with the exception of a single tuft that was left growing upon the top. Their goldsmiths worked with dexterity in painter's gold.^g The art of medicine was exercised by old women; who took into their mouth the decoction of certain herbs, and blew it through a piece of sugar cane into the patient's mouth. Young married women were often yielded up to the lords or caciques before the consummation of the marriage; and the husband considered himself honoured by this grovelling sacrifice.^h

The province of *Costa Rica* contains no mines, and hence it has been said that this name was ironically applied to it; but its excellent ship timber, its rich pastures, and its picturesque scenery, afford abundant reasons for this appellation. Cattle, and especially hogs, swarm here to an extraordinary degree. In the *Gulf of Salinas* the muscle yielding purple is caught. *Carthago*, a flourishing town, situated in the interior, is the capital of this province.

On a gulf of the Pacific Ocean we meet with the town of *Nicoya*, inhabited by carpenters, where vessels are built and repaired. They likewise manufacture there what are called cloths of Segovia.

The province of *Veragua* is still less known than the preceding. This little country, which appears at one time to have formed part of the general government of Guatemala, and, at another, part of that of Terra Firma, is covered with mountains, forests, and pasture ground. It is also said that silver mines exist there; but they are either not worked at all, or with very little exertion. *San Yago* is the capital. The descendants of Columbus, in the female line, bear the title of Dukes of Veragua.

BOOK LXXXVI.

THE DESCRIPTION OF AMERICA CONTINUED.

General Physical Description of Spanish South America.

WE now enter upon the richest and most fertile, the healthiest, the most picturesque, and excepting Africa, the most extensive peninsula of the world. While gratitude would assign to the northern division of the western continent the name of Columbia, the division now under consideration, which has received the name of South America, would with more propriety and justice be called briefly *America*. According to geographical writers, this vast peninsula contains a surface of 95,000 square leagues, of twenty-five to an equatorial degree. Nearly three-fourths of this expanse of country is contained in the Torrid Zone. Its greatest breadth is between *Cape St. Augustin*, or *Cape St. Roque*, in Brazil, and *Cape Blanco*, in Peru, a distance of 1600 leagues. The length of this peninsula ought in strictness to be calculated from *Point Gallinas*, near *Cape de la Vela*, in *Terra Firma*, in 12° of north latitude, to *Cape Froward*, in *Patagonia*, in 54° south latitude; which, in that case, would give it an extent of 1650 leagues: but it should rather be considered as reaching fifty leagues farther south, to *Cape Horn*, in *Terra del Fuego*, in 56° of latitude; for the islands which compose *Terra del Fuego* are closely attached to *America*, and in looking at the terrestrial globe the eye can scarcely perceive the distinction.

The physical geography of this great peninsula presents so much simplicity in its general character, that it is perfectly easy to comprehend its individual features. A plateau, in general, elevated 12,000 feet,^a and crowned by chains and insulated peaks of mountains, forms the whole western region of *South America*. To the east of this tract of *high land*, there is an expanse of country two or three times broader, composed of marshy or sandy plains, furrowed by three immense rivers, and by numerous streams; and still farther to the east rises another tract of *high land*, less elevated, and of less extent than the western plateau; and these three constitute the whole of the *South American peninsula*. The Spaniards occupy, or claim, the whole western table land, and the greater part of the plains; the Portuguese possess the table land on the eastern side. With the exception of the great rivers which traverse several different territories, the general physical description of *South America* may be arranged under its two great political divisions.

The majestic rivers of *South America* leave far behind them those of the old world, both by the length of their course, and the great breadth of their channels. The su-

perb Amazon claims the first rank. This river is formed in the *Andes* by the union of several branches, which themselves are considerable rivers. According to *La Condamine*,^b the *Ucayal* is the principal one; and indeed it is the *Ucayal*, or one of its branches, which all the early historians of *Peru* have considered as the principal river of this region.^c But this river is itself formed of two branches; the one is the ancient *Maranon* or *Pari*, which takes its rise in the lake *Chincay*, to the north-east of the city of *Lima*, and makes a long circuit in the *Andes* before it joins the *Apurimac*, which, according to the maps of *La Cruz d'Olmedilla*, appears to be the principal branch of the *Ucayal*; the other branch, the *Apurimac*, comes from the environs of lake *Titicaca*. Its source is in the *Andes*, to the north-east of the town of *Arequipa*. The *Ucayal*, both under the latter name and that of the *Apurimac*, traverses mountain passes almost inaccessible, desert forests, and vast solitudes, where, no doubt, it winds its course amidst picturesque beauties, which await another *La Condamine* to describe them. Nevertheless, according to the assertions of *Fathers Girbal* and *Rodriguez Tena*, the *Apurimac* receives the river *Beni*, which rises to the south of the town of *La Paz*, sixty leagues farther south than the sources of the *Apurimac*.^d It is probable that this large river will at last be discovered to be the principal branch of a system of streams, as vast as it is complicated. It is still possible, however, that the *Beni* only communicates with the *Apurimac* by means of a branch similar to the *Casiquiari*.

The other principal branch of the Amazon is the stream which flows from the lake of *Lauricocha*, a lake situated very near the source of the ancient *Maranon*, or the lake *Chincay*. The river *Lauricocha* is called the new or the *High Maranon*. It is commonly looked upon as the principal branch of the Amazon, although, in reality, this rank belongs to the *Ucayal*. The *High Maranon* becomes navigable near the town of *Jaen*, where it flows through one of those majestic narrows, called by the Spaniards *Quebrada*. Two very lofty precipices of rock, which exactly correspond with one another, leave between them a narrow ravine, where, from a breadth of 250 fathoms, the river is reduced to twenty-five, without, however, its current becoming more rapid.

From *San Joaquin d'Omaguas*, the *Ucayal* and the *High Maranon* roll their united waves across an immense plain, where, from every side, other streams bring down their tributary waters. The *Napo*, *Yupura*, *Parana*, *Cu-*

^d Travels of Father Girbal, in the *Mercurio Peruano*.

chivara, Yutay, and Puruz, would, in any other part of the world, be looked upon as considerable rivers. Here, however, they belong merely to the third or fourth rank. The *Rio Negro*, which comes from Terra Firma, and which merits the name of a great river, is swallowed up in the vast current of the Amazon.

As far as the confluence of the *Rio Negro* and the Amazon, the Portuguese term this latter river *Rio dos Salmoens*,^a or the fish river. It is not till afterwards that it is called the Amazon, for which many authors, in imitation of the Spaniards, substitute the denomination of Maranon or *Orellana*;^b but the poetical name of Amazon appears to us at once more harmonious, and more exempt from useless discussion. It is unnecessary to add that, in adopting this name, we do not admit the historical truth of certain exaggerated stories, in which the bravery of a band of women gave occasion for the revival of fictions equally extravagant as those of the Greeks, respecting the existence of a nation of Amazons.

The *Madeira*, or the river of the woods, is the greatest of all the tributary streams of the Amazon. It is in some measure a principal branch of that river. It comes from as great a distance as the Ucayal; being formed by the union of the Mamori, of which the principal branch, called the *Guapihi*, takes its rise in *Cochabamba*, and the river of the Chiquitos, denominated the river of *Santa Madalena* or *Guapore*.^c

The great rivers *Topayos* and *Xingu* come from the same quarter as the *Madeira*. They empty themselves into the Amazon. But as for the *Tocantins* or *Para*, which receives the *Aragua*, we ought to look upon its mouth as an independent outlet, although united to the Amazon by a branch of communication.

The breadth of the Amazon varies from half a league to a league towards the termination of its course. Its depth exceeds 100 fathoms. But below its confluence with the *Xingu*, and near its mouth, it resembles the sea, and the eye can scarcely discern at the same moment both its banks. The tide is felt at the distance of 250 leagues from the sea. *M. de la Condamine* imagines that the swell is occasioned by the tide of the preceding day, which is propagated up the river.^d Near its mouth there is a dreadful struggle between the water of the river, which has a constant tendency to flow into the sea, and the waves of the ocean, which press forward to enter the bed of the river. We have already sketched a description of it.

The second rank unquestionably belongs to that river which the Spaniards denominate the *Rio de la Plata*, or the river of Silver, which is formed by the union of several great streams, among which the *Parana* is regarded as the principal branch. Indeed the natives themselves give this name to the whole river; the term *La Plata* being derived from the Spaniards. The *Parana* takes its rise in the environs of *Villa del Carmen*, to the north of *Rio Janeiro*, and is increased by a multitude of tributary streams, in the mountainous country through which it flows. What is called the great cataract of the *Parana*, not

far from the town of *Guayra*, is a long *rapid*, where the river, for an extent of twelve leagues, rushes through rocky precipices, rent into the most frightful chasms.^e When it has reached the great plains, the *Parana* receives, from the north, the *Paraguay*, a very considerable river, which takes its rise on the plateau called *Campos Paresis*, and, by overflowing its banks in the rainy season, forms the great lake *Xarayes*, which consequently has only a temporary existence. The *Paraguay*, before it unites itself with the *Parana*, receives the *Pilcomayo*, a great river which comes from the environs of *Potosi*, and serves for the navigation of the interior, and the conveyance of articles connected with the mines.^f The river *La Plata* likewise receives the *Vermejo* and the *Salado*, in the direction of the *Andes*, and the *Uruguay*, on the side of *Brazil*. Its majestic course is full as broad as that of the *Amazon*; and its immense estuary might even be considered as a gulf; for it almost equals the *British channel* in breadth.

As the third great river of South America, we must next enumerate the *Oronoko*;^g but it is far from equalling the two others, either in the length of its course or the breadth of its stream. According to *La Cruz d'Olmedilla*, it rises in the small lake of *Ypava* in 5° 5' north latitude. From thence it winds in a spiral form, and first enters the lake of *Parima*, the existence of which has been ascertained by *Don Solano*, governor of *Caraccas*; but which, after all, owes its origin perhaps to the temporary overflowing of the river. If the country were a plain, we should compare the lake of *Parima* with that of *Xarayes*; but as it is at least a hilly country, we imagine that this famous lake resembles the great and almost permanent inundation which is formed by the *Red River* in *Louisiana*.^h After issuing from this lake by two mouths, as is asserted, it receives the *Guayavari*ⁱ and several other rivers, and enters the ocean through a large delta, after a course of 270, or, at the very most, 300 leagues. Nevertheless, at its estuary, it has the appearance of a boundless lake, and for a great extent its fresh waters cover the ocean. "Its green-coloured stream, and its waves dashing over the rocks in milk white foam, are strongly contrasted with the deep blue of the sea, which is separated from them by a strongly marked line."^k

The current formed by the *Oronoko*, between the continent of South America and the island of *Trinidad*, is so very strong, that vessels, even when favoured by a fresh breeze from the west, can scarcely overcome it. This solitary and dreadful place is called the *Melancholy Gulf*;^l the entrance to which is formed by the *Dragon's Mouth*.^m There, in the midst of furious waves, enormous rocks raise their isolated heads, the remains, says *Humboldt*, of that ancient dyke which formerly joined the island of *Trinidad* to the coast of *Paria*. It was at the aspect of these places that *Columbus* was convinced, for the first time, of the existence of the continent of America. "So prodigious a body of fresh water," thus reasoned that excellent observer of nature, "could not possibly have been accumulated, except by a river of very lengthened

course. The land, therefore, which affords this water must be a continent, and not an island ;” but, unacquainted with the general resemblance that exists between all the productions of the proper climate of the palm tree, Columbus imagined that the new continent was a continuation of the eastern coast of Asia. The refreshing mildness of the evening air, the ethereal clearness of the sky, the balsamic fragrance of the flowers wafted to him by the land breeze, all combined to make him suppose that he could not be far distant from the garden of Eden, the sacred residence of our first parents. The Oronoko appeared to him to be one of the four rivers which, according to the sacred writings, issued from the terrestrial paradise to water and divide the earth.

There are several cataracts in the Oronoko, amongst which Humboldt has distinguished those of *Maypura* and *Atures*. Neither of them is of any great elevation, and both owe their existence to an archipelago of little islands and rocks. These rapids or *raudals*, as the Spaniards call them, present an extremely picturesque appearance. “When the traveller descends from the village of *Maypura* to the brink of the river, after clearing the rock of *Manimi*, he enjoys a truly astonishing prospect. At once a sheet of foam stretches out before him to fully a mile in extent. Masses of rock, of an iron black colour, rear their rugged fronts, like towers, from the midst of the torrent. Every island, every rock, is ornamented with luxuriant trees, closely grouped together. A thick smoke constantly hangs suspended over the water ; and through this foggy vapour, which rises from the foam, shoot up the tops of lofty palm trees. As soon as the burning rays of the setting sun are refracted in this humid cloud, the optical phenomena which are produced, actually give an air of enchantment to the scene. The coloured arches successively appear and disappear, and their image incessantly hovers before the eye at the mercy of the wind. During the long season of the rains, the murmuring waters have accumulated little islands of vegetable earth round the naked rocks. Adorned with the *Drosera*, the *Mimosa*, with its foliage of silver white, and a multitude of other plants, they form beds of flowers in the midst of frowning rocks.”

The communications which exist between the Oronoko and the Amazon constitute one of the most astonishing phenomena of physical geography. The Portuguese made this fact known to the world above fifty years ago ; but the systematic geographers leagued together to prove that such conjunctions of rivers were impossible. In the present day we no longer stand in need of either analogies or critical reasoning. Humboldt has navigated these rivers, and has examined this singular arrangement of the surface. It is now certain that the Oronoko and the Rio Negro flow along a plateau, which, at this part, has no decided declivity ; a valley then occurs ; their waters flow into it, and are united, and thus form the celebrated *Casiquiari*, by means of which MM. Humboldt and Bonpland passed from the Rio Negro into the Oronoko. It is believed that there are still other communications between the Rio Negro and the different tributary streams of the Amazon. The lake of *Parima*, if it have only a temporary existence,

may very possibly empty itself both by the Oronoko and by the White River or *Parima*, which flows into the Amazon.

Although in other respects so well watered, South America contains several rivers and streams which have no outlet. Such is *Lake Titicaca*, which, it is true, discharges itself into what is called the lake *das Aullagas* ; but neither the one nor the other of these lakes empties itself into the sea. In *Tucuman*, and to the south-west of *Buenos Ayres*, there is an immense plain, completely horizontal, which is furrowed by currents of water, and chains of little lakes, that gradually lose themselves in the sands or in lagoons.

Such are the grand details of the hydrography of South America. Let us now proceed to the description of the Andes, a chain of mountains, the whole of which is comprised in the Spanish portion of this vast continent.

The Andes, which derive their name from the Peruvian word *anti*, signifying copper, and originally applied to a chain in the vicinity of *Cuzco*, form a long rampart, as it were, extending from north to south, and crowned by other chains of mountains, which sometimes run along the same line as the great chain, at others, are placed in a transverse or oblique direction, inclosing valleys or extending into plateaus.

This high land follows the coast of the Pacific Ocean through the whole extent of *Chili* and *Peru*, and is very seldom more than ten or twelve leagues from the sea. Narrow towards its southern extremity, it all at once becomes broader to the north of *Chili*. Near *Potosi* and lake *Titicaca* it attains its greatest breadth, which is sixty leagues. Near *Quito*, under the equator, we meet with the loftiest summits of this chain, which, in fact, constitute the most elevated mountains that have yet been measured on the terrestrial globe.* At *Popayan* this great dyke or high land terminates and divides into several chains. Two of these are the most remarkable ; one of them is extremely low, and runs towards the isthmus, of which it forms the spine ; the other approaches the Caribbean sea, follows its coasts, and even appears, by a little submarine chain, to be continued as far as the island of *Trinidad*.

Let us now consider the different parts of this vast system. From the impossibility of giving a complete methodical description, we shall travel with MM. Humboldt, *La Condamine*, *Bouguer*, and *Helm*.

The chain which borders the northern coast of *Terra Firma*, is, generally speaking, from 3600 to 4800 feet^b above the sea, and the plains which extend at its base, from 600 to 1560 feet ;^c but there are isolated summits that shoot up to a very great height. The *Sierra Nevada de Merida* has an elevation of 14,100 feet,^d and the *Silla de Caracas*, 13,896 feet.^e These peaks are covered with perpetual snow ; boiling matter often issues from them in torrents, and earthquakes are not uncommon. The chain is more abrupt to the north than to the south. In the *Silla de Caracas*, there is a frightful precipice of more than 7800 feet^f in height. As in the lower branches of the Andes, the rocks of this chain are composed of *gneiss* and *micaceous schistus*. These substances are sometimes found in beds of two or three feet in thickness, and con-

* The Himalaya mountains contain higher summits, if we may believe the measurements of the English in India.—P.

^b “600 to 800 toises.”

^c “100 to 260 toises.”

^d “2350 toises.”

^e “2316 toises.”

^f “1300 toises.”

tain large crystals of felspar. The mica slate often incloses red garnets and cyanite, (*disthene*.) In the gneiss of the mountain of Avila, green garnets are found. Nodules of granite also occur. To the south, the chain is accompanied by calcareous mountains, which sometimes attain a higher elevation than the primitive mountains, and contain some rocks of veined serpentine, and bluish steatite. To this system of mountains we may apply the name of *the chain of Caraccas*.

The granitic chain that traverses the isthmus of Panama, but which scarcely merits the name, is only from 300 to 900 feet^a in height, and even appears to be completely interrupted between the sources of the Rio Atrato, and the Rio San Juan.^b

In the kingdom of New Granada, from 2° 30', to 5° 15' north latitude, the Cordillera of the Andes is divided into three parallel chains, of which only the two lateral ones, at very great elevations, are covered with sand-stone, and other secondary formations. The *eastern chain* separates the valley of the river *Magdalena* from the plains of the Rio Meta. Its highest summits are the *Paramo de la Suma Paz*, that of *Chingaza*, and the *Cerros of San Fernando*, and *Tuquillo*. None of them rise to the region of perpetual snow. Their mean height is 12,000 feet^c; consequently, they are 1680 feet^d higher than the most elevated mountain of the Pyrenees. The *central chain* divides the waters between the basin of the river *Magdalena* and that of the Rio Cauca. It often reaches the limit of perpetual snow, and passes far beyond it in the colossal peaks of *Guanacas*, *Buragan*, and *Quindiu*, which are all of them elevated from 15,000 to 16,800 feet^e above the level of the ocean. At the rising and setting of the sun, this central chain presents a magnificent spectacle to the inhabitants of Santa Fé, and brings to the recollection of the traveller, only with more imposing dimensions, the view of the Alps of Switzerland. The *western chain* of the Andes separates the valley of Cauca from the province of Choco and the coasts of the South Sea. It is scarcely 4500 feet^f in height.^g

These three chains of mountains are again intermingled towards the north, under the parallel of Menzo, and Antioquia, in 6° and 7° north latitude. They also form a single group, or one continuous mass, to the south of Popayan, in the province of Pastos. We must carefully distinguish these ramifications from the division of the Cordilleras observed by Bouguer and La Condamine in the kingdom of Quito, from the equator to latitude 2° south. That division is formed only by plateaus, which separate mountains that are placed upon the very ridge of the Andes themselves. The lowest level of these plateaus is still 8400 feet^h above the sea. The three chains of which we have been speaking, are, on the contrary, separated by deep and extensive valleys, which are the basins of great rivers—the bottom of which is even less elevated above the level of the sea than that of the Rhone in the valley of Sion.

The passes by which these chains are crossed merit our attention. MM. Bouguer and Humboldt have described

them. The city of Santa Fé de Bogota, the capital of the kingdom of New Granada, is situated to the west of the *Paramo de Chingaza*, upon a plateau of 8142 feetⁱ of absolute height, extended along the ridge of the *eastern Cordillera*. In travelling from this town to Popayan, and the banks of the Cauca, it is necessary to descend the *eastern chain*, to pass the valley of the *Magdalena*, and then to cross the *central chain*. The most frequented pass is that of *Paramo de Guanacas*, described by Bouguer, during his return from Quito to Carthagen. Humboldt preferred the pass of the mountain of *Quindiu*, or *Quindio*, between the towns of Ibagua and Carthago—by far the most fatiguing in the whole Cordillera of the Andes. He was, first of all, obliged to cross a dense forest, which, during the most favourable season, occupies a space of ten or twelve days. During the whole of this journey, not a single cabin is met with, nor any means of subsistence. The pathway by which he crossed the Cordillera is frequently no more than one or two feet in breadth, and resembles, through the chief part of its extent, a hollow gallery, open to the sky. In this part of the Andes, as almost every where else, the rock is covered with a thick incrustation of clay; this is hollowed into ravines by the streamlets of water which descend from the mountain. The traveller shudders in marching along these tremendous fissures, which are filled with mud, while, at the same time, their obscurity is increased by the thick vegetation which, hanging down from above, covers the opening.

The *Quebradas* are formed upon a still grander scale. They are immense rents, which, dividing the mass of the Andes, break the continuity of the chain which they traverse. Mountains, as large as the *Puy de Dome*, would be completely swallowed up in the vast depth of these ravines, which isolate the different regions of the Andes, like so many peninsulas in the bosom of an aerial ocean. It is in the *Quebradas* that the eye of the terrified traveller can best comprehend the gigantic magnificence of the Cordillera. Through these natural gates the great rivers find a passage to the sea.

When we advance from Popayan towards the south, we perceive on the arid table-land of the province of Pastos, the three chains of the Andes intermingled in one group, which extends far beyond the equator. In the kingdom of Quito, this group presents a peculiar appearance from the river Chota, which winds its serpentine course amid mountains of basaltic rock, to the *Paramo de l'Ossuay*, where we still observe the memorable remains of Peruvian architecture. The most elevated summits are ranged in two files, which, in some measure, form a double crest to the Cordillera. These colossal peaks, covered with eternal snow, served as signals, in the operations of the French academicians, during their measurement of the equatorial degree. Their symmetrical arrangement in two lines, running from north to south, led Bouguer to consider them as two chains of mountains, separated by a longitudinal valley. But what this celebrated astronomer terms the bottom of a valley, is, in reality, the very ridge of the Andes; a plateau, in fact, of which the absolute

^a "50 to 150 toises."

^b Wafer's voyage and description of isthmus of America, mentions many very high mountains, the highest of which he spent four days in ascending; he was affected with giddiness on its summit. p. 27.

^h "1400 toises."

ⁱ "1357 toises."

height is from 2925, to 3142 yards.^a A double crest ought not to be confounded with an actual ramification of the Cordilleras. It is on these plateaus that the population of this wonderful country is concentrated; and there, too, are situated towns that contain from 30 to 50,000 inhabitants. "After living for some months on this elevated plateau," says Humboldt, "where the barometer stands at 21.33 inches English, the traveller irresistibly experiences an extraordinary illusion. He gradually forgets that every surrounding object, those villages that proclaim the industry of a nation of mountaineers; those pastures, covered at the same time with lamas, and with the sheep of Europe; those orchards, bordered with quickset hedges of the Duranta, and the Barnadesia; those luxuriant and highly cultivated corn fields—occupy a station suspended, as it were, in the high regions of the atmosphere; and he can scarcely bring himself to believe that this habitable region is even still farther elevated above the neighbouring shores of the Pacific Ocean, than the Pyrenean summit of *Canigou* is above the basin of the Mediterranean."

By looking upon the ridge of the Cordilleras as a vast plain, bounded by curtains of distant mountains, we become accustomed to consider the inequalities of their crest as so many separate summits. *Pichincha*, *Cayambe*, *Cotopaxi*, all those volcanic peaks, which are designated by particular names, although, for more than one half of their total height, they constitute only one single mass, appear to the inhabitants of Quito as if they were so many distinct mountains, rising from the midst of a plain destitute of woods. The deception becomes more complete, in consequence of the indentations in this double crest of the Cordilleras descending to the level of the higher inhabited plains. Accordingly, the Andes present the appearance of a chain only when viewed at a distance, either from the shores of the great ocean, or from the savannas that extend to the base of their eastern declivity.

The Andes of Quito compose the most elevated portion of the whole system, particularly between the equator and 1° 45' of south latitude. It is only on this limited space of the globe that mountains of above 19,000 feet^b in height, have been measured with exactness; and even in this respect, there are only three peaks to which this remark can be applied; namely, Chimborazo, which would exceed the height of Mount Etna, placed on the summit of *Canigou*, or that of St. Gothard piled on the top of the Peak of Teneriffe; the other two are *Cayambe* and *Antisana*. From the traditions of the Indians of Lican, we learn, with some degree of certainty, that the Altar Mountain, called by the natives *Capa-Urcu*, had once a greater elevation than Chimborazo, but that, after a continual eruption of eight years, this volcano sunk to a lower altitude. In proof of this fact, the top of the mountain presents in its inclined peaks, nothing but the traces of destruction.

The geological structure of this part of the Andes does not essentially differ from that of the great mountain chains of Europe. Granite constitutes the base, upon which the less ancient formations repose. It comes into view at the foot of the Andes, on the shores of the Pacific Ocean, as well as on those of the Atlantic, near the mouths of the *Oronoko*. Sometimes in masses, at others

in strata (*bancs*.) regularly inclined and parallel; and containing round masses, in which mica alone prevails; the granite of Peru resembles that of the higher Alps and of Madagascar. Upon this rock, and occasionally alternating with it, is found *gneiss* or schistose granite, which passes into mica slate, and this again into primitive clay slate. Granular limestone, primitive trap, and chlorite slate, form subordinate beds in the *gneiss* and mica slate; while this latter, which is extensively diffused through the Andes, often encloses beds of graphite, and serves as a base to formations of serpentine, which sometimes alternate with sienite. The crest of the Andes is every where covered with porphyries, basalts, clink stone, and green stone. These rocks, divided into columns, present, at a distance, the appearance of an immense assemblage of dilapidated towers. The thickness and extent of the schistose and porphyritic rocks is the only great phenomenon by which the Andes differ from the mountains of Europe. The porphyries of Chimborazo are 11,400 feet^c in thickness, without a mixture of any other rock; the pure quartz, to the west of Caxamarca, is 9000,^d and the sandstone of the environs of Cuenca 4800.^e These rocks form the whole of the central elevation of the Andes, while, in Europe, granite or primitive limestone constitutes the summit of the chains. Volcanoes have penetrated these immense beds, and have covered their sides with obsidian and porous amygdaloid. The lowest volcanoes sometimes throw out lava; but those of the Cordillera, properly so called, only eject water or scorified rocks, and more frequently clay, intermixed with sulphur and carbon.^f

As we penetrate into Peru, we see the chains of the Andes become more numerous, and increase in breadth, but, at the same time, diminish in elevation.

Chimborazo, like Mont Blanc, forms the extremity of a colossal group. From Chimborazo, as far as 120 leagues to the south, no mountain peak attains the limit of perpetual snow. The crest of the Andes has there only from 3360 to 3800 yards^g of elevation. Beyond the eighth degree of south latitude, or the province of Guamachuco, the snowy peaks become more numerous, especially near Cuzco and La Paz, where the peaks of *Himani* and *Cururana* shoot up their summits to the clouds. Every where in this region, the Andes, properly so called, are bordered to the east by several inferior chains. The missionaries who have traversed the mountains of Chachapoya, those that skirt the *Pampa del Sacramento*, those that form the *Sierra de San Carlos*, or the *Grand Pajonal*, and the *Andes de Cuzco*, represent them as being covered with large trees and luxuriant meadows, and consequently, as being considerably lower than the true Cordillera. With regard to the latter, M. Helm, director of the mines of Spain, has afforded us some knowledge of the central portion, where the division into two parallel ridges, which Bouguer had observed farther to the north, is very manifestly visible. According to this writer, the eastern side of the Andes sometimes presents both red and green granite, and *gneiss*, amongst other places, near Cordova and Tucuman; but the great chain principally consists of argillaceous schistus, or of different varieties of thick roof slate, of a bluish, dark red, gray, or yellowish colour. From time to time

^a "2700 to 2900 mètres."

^g "3100 to 3500 mètres, or 1600 to 1800 toises."

beds of limestone and large masses of ferruginous sandstone are met with. A beautiful mass of porphyry crowns the mountain of Potosi. From that city to Lima, the argillaceous schistus seemed to this observer to predominate; the granite sometimes appeared in long beds or in round masses; the base of clay slate was often covered with beds of marl, gypsum, limestone, sand, fragments of porphyry, and even rock salt.

The accidental observations of M. Helm do not furnish us with a complete geological view; but yet they coincide with the above description of the Andes of Quito, which we have taken from Humboldt.

The Andes of Chili do not seem to yield in height to those of Peru; but their nature is less perfectly known. Volcanoes appear to be there more numerous. The lateral chains disappear, and the Cordillera itself presents only a single ridge. More to the south, in New Chili, latitude 44° S. the Cordillera approaches so close to the ocean that the precipitous islets of the archipelago of Huayatecas may be regarded as a fragment detached from the chain of the Andes. They are so many Chimborazos and Coto-paxis, but plunged two-thirds of their height into the abyss of the ocean. On the continent, the snowy cone of Cupatana is elevated nearly 3142 yards;^a but more to the south, near Cape Pillar, the granitic mountains sink to about 433 yards,^b and even still lower.

According to the accounts of navigators, there is reason to consider the principal part of the southern extremity of the Andes, at the Straits of Magellan, as composed of masses of basalt, which rise in the form of columns.

The metallic riches of the chain of the Andes appear to surpass those of the Mexican Cordillera; but placed at a greater elevation in the snowy region, and far from forests and cultivated land, the mines, hitherto discovered, have not been equally productive. At the same time, this remark, important as it is in a political point of view, is anything but conclusive with regard to physical geography. For even supposing that mines are not discovered in the Andes at a lower level, still, nevertheless, they may exist, and be concealed from the view, and from all approach, merely by some formations of rocks placed upon the metalliferous schistus in a greater mass than in Mexico.

The Andes, by no means abounding in calcareous rocks, contain very few petrifications. The belemnites and ammonites, so common in Europe, seem to be unknown. In the chain of Caraccas, Humboldt found a great quantity of petrified shells, which resembled those of the neighbouring sea. In the plain of the Oronoko, trees are found petrified, and converted into a very hard breccia.

Petrified shells are also found at Micuipampa, and at Huancavelica, at an elevation of 12,000 and 13,200 feet.^c Other remains of a former world are discovered at an inferior level. There has been found near Santa Fé, in the Campo de Gigante, at an elevation of 8,220 feet,^d an immense quantity of the fossil bones of elephants, both of the African kind, and of the carnivorous species,^e discovered near the Ohio. Some have also been found to the

south of Quito, and in Chili; so that we can now prove the existence and the destruction of these gigantic elephants from the Ohio to Patagonia.

The temperature, determined as much by the level as by the latitude, here presents contrasts similar to those which we have observed in Mexico. The inferior limit of perpetual snow under the equator, is at the height of 14,760 feet;^f this boundary, invariable and strongly defined, must strike the most careless observer. The other divisions of climate are more intermingled; notwithstanding which, they may be defined with greater precision than they have hitherto been.

The three zones of temperature which originate in America from the enormous difference of level between the various regions, cannot by any means be compared with the zones which result from a difference of latitude. The agreeable and salutary vicissitudes of the seasons, are wanting in those regions that are here distinguished by the denominations of *cold* or *frigid*, *temperate*, and *hot* or *torrid*. In the frigid zone it is not the intensity but the continuance of the cold, the absence of all vivid heat, and the constant humidity of a foggy atmosphere, that arrest the growth of the larger vegetables, and, in man, perpetuate those diseases that arise from checked perspiration. The hot zone does not experience excessive heat; but it is the perpetual continuance of the heat, together with the exhalations from a marshy soil, and the miasmata of an immense mass of vegetable putrefaction, added to the effects of an extreme humidity, that produces fevers of a more or less destructive nature, and spreads through the whole animal and vegetable world the agitation of an exuberant but deranged vital principle. The temperate zone, by possessing only a moderate and constant warmth, like that of a hot-house, excludes from its limits both the animals and vegetables that delight in the extremes of heat and cold, and produces its own peculiar plants, which can neither grow above its limits, nor descend below them. Its temperature, which does not brace the constitution of its constant inhabitants, acts like spring on the diseases of the hot region, and like summer on those of the cold region. Accordingly, a mere journey from the summit of the Andes to the level of the sea, or vice versa, proves an important medical agent, which is sufficient to produce the most astonishing changes in the human body. But, living constantly in either the one or the other of these zones must enervate both the mind and the body by its monotonous tranquillity. Summer, spring, and winter, are here seated on three distinct thrones, which they never quit, and which are constantly surrounded by the attributes of their power.^g

Vegetation presents a greater number of gradations, of which it becomes necessary to point out the principal. From the shores of the sea to the height of 1083 yards,^h we meet with magnificent palms, the *Musa*, the *Heliconia*, the *Theophrasta*, the most odoriferous of the *liliaceæ*, the balsam of Tolu, and the cinchona of Carony. The large flowered jessamine, and the *Datura arborea*, exhale at night their delicious perfume round the city of Lima, and,

^h "1000 mètres, (513 toises.)"

placed in the hair of the ladies, acquire an additional charm by heightening the graces of female loveliness. On the arid shores of the ocean, under the shade of the cocoa nut tree, the mangrove springs, with the cactus, and various saline plants, and, amongst others, the *Sesuvium portulacastrum*.^a A single species of palm, the *Ceroxylon andicola*, has separated itself from the rest of its family, to inhabit the heights of the Cordillera, at from 5400 to 8700 feet^b of elevation.

Above the region of the palms commences that of the arborescent ferns,^c and of the *Cinchona*. The former cease to grow at 4800 feet,^d while the latter stops at 8700.^e The febrifuge substance, which renders the bark of the cinchona so precious, is met with in several trees of different species, some of which grow at a very low level, even on the sea shore; but as the true cinchona does not grow at a lower elevation than 2118 feet,^f it has not been able to pass the isthmus of Panama. In the temperate region of the cinchona grow some of the lily tribe, for example, the *Cipura* and the *Sisyrinchium*; the *Melastoma*, with large violet-coloured flowers; the *Passion-flower tree*, as lofty as our northern oaks; the *Thibaudia* the *Fuchsia*, and the *Alstromeria*, of singular beauty. It is there that majestically rise the *Macrocnemum*, the *Lisianthus*, and the various *Cucullarias*. The ground is covered, in moist places, with evergreen mosses, which sometimes form a turf of as great beauty as that of Scandinavia or England. The ravines conceal the *Gunnera*, the *Dorstenia*, the *Oxalis*, and a multitude of unknown *Arums*. At about 5232 feet^g of elevation, we meet with the *Porlieria*, which marks the hygrometrical state of the air; the *Citrosma*, with odoriferous leaves, and fruit; and numerous species of *Symplocos*. Beyond the height of 2392 yards^h the coldness of the air renders the *Mimosas* less sensitive, and their leaves no longer close on being touched. Beyond the height of 2668, and especially of 3078 yards,ⁱ the *Acena*, the *Dichondra*, the *Hydrocotyle*, the *Nerteria*, and the *Alchemilla*, form a very thick and verdant turf. The *Mutisia* there climbs the loftiest trees. The oaks do not commence in the equatorial regions at a lower elevation than 1842 yards.^k These trees alone sometimes present, under the equator, the appearance of spring; for they lose all their leaves, and others sprout forth, the young verdure of which is mingled with that of the *Epidendrum*, which grows on their branches. In the region of the equator, the great trees, those of which the trunk measures more than ten or fifteen fathoms, (*toises*), do not rise beyond the level of 2925 yards.^l Above the level of the city of Quito, the trees are smaller, and their height is not to be compared with that which the same species attain in the more temperate climates. At 3600 yards^m almost the whole vegetation of trees entirely disappears; but at this eleva-

tion the shrubs become so much the more common. This is the region of the *Berberis*, the *Duranta*, and the *Barnadesia*. These plants characterise the vegetation of the plateaus of Pasto and Quito, as that of Santa Fé is distinguished by the *Polymnia* and the *Datura arborea*. The soil is there covered with a multitude of *Calceolarias*, the golden coloured corolla of which enamels the verdure of the turf in a beautiful manner. Higher up, on the summit of the Cordillera, from an elevation of 8640 to that of 10,200 feet,ⁿ we find the region of the *Wintera* and the *Escallonia*. The cold but always humid climate of these heights, called by the natives *Paxamos*, produces shrubs, of which the trunks, short and stunted,^o divide into an infinite number of branches, covered with coriaceous leaves of a shining verdure. Some trees of the orange-coloured cinchona,^p the *Embothrium*, and the *Melastoma*, with violet and almost purple-coloured flowers, grow at this elevation. The *Alstonia*, the leaf of which, when dry, yields a salutary tea, the *Granadian Wintera*,^q and the *Escallonia tubar*, which extends its branches in the shape of a parasol, form there scattered groups.

A broad zone, of from 6000 to 12,600 feet,^r presents us with the region of alpine plants, that, namely, of the *Stæhelinea*, the *Gentians*, and the *Espeletia frailecon*,^s the hairy leaves of which often serve as a shelter to the unfortunate Indians who have been benighted in these regions. The turf is adorned with the *Dwarf lobelia*,^t the *Sida* of Pichincha,^u the ranunculus of Gusman,^v and the gentian of Quito, besides many other new species. At the height of 12,600 feet,^w the alpine plants are succeeded by the grasses, the region of which extends 1800 or 2400 feet^x higher. The *Jarava*, the *Stipa*, and many other new species of *Panicum*, *Agrostis*, *Avena*, and *Dactylis*, cover the ground. At a distance it has the appearance of a gilded carpet, and, by the inhabitants of the country, is called *Pajonal*. Snow occasionally falls in this region of the grasses. At the height of 14,160 feet,^y the phænogamous plants entirely disappear. From this boundary to that of perpetual snow only the lichens cover the rocks. Some of these plants appear to grow even under the eternal ice.

The cultivated plants are met with in zones that are neither so narrow nor so rigorously defined. In the region of the palms, the natives cultivate the banana, jatropha, maize, and cacao. Europeans have introduced the sugarcane, and indigo plant. After passing the level of 3100 feet,^z all these plants become rare, and only prosper in particular situations. It is thus that the sugarcane grows even at the height of 7500 feet.^{aa} Coffee and cotton extend across both of these regions. The cultivation of European corn commences at 3000 feet,^{ab} but its growth is uncertain lower than 1500 feet^{ac} above this line. Wheat

is the most vigorous, from a height of 4500 to 6000 feet.^a One year with another it produces twenty-five or thirty grains for one. Above 5400 feet^b the fruit of the banana does not easily ripen; but the plant is still met with, although in a feeble condition, 2400 feet^c higher. The region comprehended between 4920 and 5760 feet^d is also the one which principally abounds with the *cocca*, or *Erythroxyllum Peruvianum*, a few leaves of which, mixed with quicklime, support the Peruvian Indian in his longest journeys through the Cordillera. It is at the elevation of from 6000 to 9000 feet^e that the *Chenopodium quinou*, and the various grains of Europe, are principally cultivated, a circumstance which is greatly favoured by the extensive plateaus that exist in the Cordillera of the Andes, the soil of which being level, and requiring little labour, resembles the bottom of ancient lakes. At the height of 9600 or 10,200 feet,^f frost and hail often destroy the crops of corn. Maize is scarcely any longer cultivated above the elevation of 7200 feet;^g 1800 feet^h higher, and the potato is produced; but it ceases at 12,600 feet.ⁱ At about 10,200 feet,^k wheat no longer grows, and barley only is sown, although even this grain suffers from the want of heat. Above 11,040 feet,^l all agriculture and gardening cease; and man dwells in the midst of numerous flocks of lamas, sheep, and oxen, which, wandering from each other, are sometimes lost in the region of perpetual snow.

To complete this physical description of South America, we shall now proceed to consider the various animals that live at different heights in the Cordillera of the Andes, or at the foot of those mountains. From the level of the sea to 3078 feet,^m in the region of the palms and the scitamineæ, we meet with the sloth, which lives on the *Cecropia peltata*; the boa, and the crocodile, who sleep or drag along their frightful mass at the foot of the *Conocarpus* and the *Anacardium caracoli*.ⁿ It is there that the *Cavia capybara* hides himself in the marshes that are covered with the *Heliconia* and the *Bambusa*, to withdraw himself from the pursuit of the carnivorous animals. The *Tanagra*, the *Crax*, and the *Parrots*, perched on the *Caryocar* and the *Lecythis*, mingle the brilliance of their plumage with that of the flowers and leaves. It is there that we see the glittering of the *Elater noctilucus*, which feeds on the sugar-cane; and there, too, the *Curculio palmarum* lives in the heart of the cocoa-nut tree. The forests of these burning regions resound with the howlings of the alouattes^o and other sapajous. The *jaguar*, the *Felis concolor*,^p and the black tiger of the Oronoko, still more sanguinary than the jaguar, there relentlessly chase the little stag, (*Cervus Mexicanus*),^q the *Cavias*, and the ant-eaters, whose tongue is fixed to the end of their sternum. The air of these lower regions, especially in the woods and on the banks of the rivers, swarms with those countless myriads of the *mosquito*,

a fly which renders a large and beautiful portion of the globe almost uninhabitable. To the mosquito is added the *Cestrus humanus*, which deposits its eggs in the skin of the human body, and occasions painful swellings; the *Acari*, which furrow the skin; venomous spiders, and ants and termites, whose formidable industry destroys the labours and the books of the inhabitants. Still higher, from 3078 to 6156 feet,^r in the region of the arborescent ferns, we seldom meet with the *jaguar*, never with the boa, alligator, or lamentin, and rarely with the monkeys; but the tapir, the *Sus tajassu*, and the *Felis pardalis*^s are there numerous. Man, the monkey, and the dog, are there accommodated by an infinite multitude of the *Pulex penetrans*, which is less abundant on the plains. From 6156 to 9234 feet,^t in the higher region of the cinchona, we no longer meet with the monkey or the Mexican stag; but we now find the tiger cat, the bear, and the great stag of the Andes. Lice abound in the Andes at this height, which is that of the Peak of Canigou. From 9234 to 12,300 feet,^u is found the small species of lion, which, in the Quichua language, is known by the name of the *puma*; the lesser bear, with a white forehead; and some of the weasel tribe. Humboldt has often seen with astonishment the *calibri* or humming bird at the height of the Peak of Tenerife. The region of the grasses, from 12,300 to 15,400 feet^v of elevation, is inhabited by flocks of the *vicuna*, *guanaco*, and *alpaco*, in Peru, and the *chili-hueque* in Chili.^w These quadrupeds, which here represent the genus *Camelus* of the old continent, have not extended themselves either to Brazil or Mexico, because, during their journey, they must necessarily have descended into regions that were too hot for them to exist in. The *lama* is only met with in the domestic state; because those that are found on the western declivity of Chimborazo, became wild at the period of the destruction of Lican by the Inca Tupayurangi. The vicuna prefers those places in particular where snow occasionally falls. Notwithstanding the persecution which it has experienced, flocks of 300 or 400 in number are still to be seen, especially in the provinces of Pasco, at the sources of the river Amazon, and in those of Guailas and Caxatambo, near Gorgor. This animal likewise abounds near Huancavelica, in the environs of Cuzco, and in the province of Cochabamba, near the valley of the *Rio Ccattages*. They are found there wherever the summit of the Andes rises higher than the summit of Mont Blanc. The inferior limit of perpetual snow is the higher boundary, as it were, of organised beings; some of the lichens even grow under the snow itself; but the condor, (*Vultur gryphus*) is the only animal which inhabits these vast solitudes. Humboldt has seen them sailing through the air at the immense height of 21,100 feet.^x Some sphinxes and flies were observed at the height of 19,180 feet,^y and

appeared to him to have been involuntarily carried into these regions by ascending currents of air.^a

To this distribution of the animal kingdom, according to the elevation of the country, might be joined a sketch of the purely geographical limits which certain animals never pass. It is a remarkable phenomenon that the *alpaco*, *vicuna*, and *guanaco*, follow the whole chain of the Andes, from Chili to the 9° of south latitude, and that none should afterwards be observed north of this point, either in the

kingdom of Quito, or in the Andes of New Granada. The writers of the country attribute this fact to the herb *ichos*, which these animals prefer to every other kind of food, but which they do not meet with beyond the above limits. The ostrich of Buenos Ayres presents an analogous phenomenon. This great bird is not found on the vast plains of the Parexis, where, nevertheless, the vegetation appears to resemble that of the Pampas. Perhaps, however, the saline plants may not exist there. Other differences will be afterwards indicated, in the particular descriptions.

BOOK LXXXVII.

THE DESCRIPTION OF AMERICA CONTINUED.

Particular Description of Caraccas, New Granada, and Quito.

THE first Spaniards who visited the coast extending from the Oronoko to the isthmus, were in the habit of designating it under the general name of *Terra Firma*.^a Their king, Ferdinand, gave to the western part the appellation of *Castile d'Or*.^b This latter denomination, however, fell into disuse, and, in proportion as the rest of the continent was discovered, the former must have appeared improper. Notwithstanding this circumstance, it still continues to be employed, but it is confined to a small government, comprehending the provinces of Veragua, Panama, and Darien; a government which seems by no means to correspond completely with the extent of *Castile d'Or*.^c A perseverance in error has led geographical writers still to retain *Terra Firma* within the boundary of its original extent, and to comprehend in this imaginary division the captain-generalship of *Caraccas*, or *Venezuela*, of which Spanish Guiana forms a part, and the new kingdom of Granada, which at present includes the kingdom of *Quito*.

Cape *De la Vela*, and the chain of mountains which runs from this promontory to join the Andes, mark the limits between New Granada and Caraccas. This latter general government contains the province of *Venezuela*, or *Caraccas*; that of *Maracaibo*, comprehending the districts of Merida and Truxilla; those of *Varinas*, and *Spanish Guiana*, and that of *Cumana*, or *New Andalusia*, containing the district of Barcelona. The island of *Sta. Margarita* is a small military government depending on *Cumana*. The first conquerors of this country having observed Indian villages, built on piles, in the islands of the lake of Maracaibo, gave to the whole country the name of *Venezuela*. Long the deplorable theatre of a horrible civil war, Caraccas has undergone so many political changes, that its topographical description, even derived from the most recent works, is accompanied with great uncertainty.^d

The chain of mountains running between the Caribbean sea, and the basin of the Oronoko, having little elevation, almost every where admits of being cultivated. According to the difference of level, they enjoy, in some places, the refreshing coolness of perpetual spring, while in others, the influence of latitude is completely felt.

^d Neither Caraccas, New Granada, Mexico, Chili, nor Buenos Ayres, have made the least attempt to extend or alter their boundaries.* The con-

* Chiapa, formerly a province of the captain-generalship of Guatuala, is now included in the republic of Mexico.—P.

Winter and summer, that is to say, the rainy and the dry season, completely divide the year. The former commences in November, and ends in April. During the six remaining months the rains are less frequent, sometimes even rare. Storms have been less frequent since the year 1792 than before that period, but earthquakes have committed dreadful ravages. Some gold mines have been discovered, but, in consequence of the revolt of the Indians, they have been abandoned. In the jurisdiction of St. Philip, they have discovered a copper mine, which supplies the wants of the country, and even affords metal of excellent quality for exportation. The pearl fishery along the coast, once of importance, is now abandoned. The northern coast of the province of Venezuela produces a great deal of fine white salt. Mineral and hot springs, although very abundant, are little frequented. The forests that cover the mountains of Caraccas, would, for ages to come, supply the most extensive dock yards, but the nature of the surface renders it too difficult an operation to remove the trees, of which, at present, navigation, possessing little activity, does not stand in need. The forests also produce a great variety of woods, admirably adapted for dyeing and cabinet-work. Medicinal drugs, such as sarsaparilla and cinchona, are also collected. The lake of Maracaibo furnishes mineral pitch, or pissasphaltes, which, mixed with tallow, is used for paying vessels. The bituminous vapours which float on the surface of the lake, frequently take fire spontaneously, especially during the great heats. The banks of this lake are so barren, and so unhealthy, that the Indians, instead of fixing their habitations there, prefer living on the lake itself. The Spaniards found many villages constructed there, without order, it is true, or uniformity, but built on solid piles. This lake, which is seventy leagues^e in length, and thirty broad, communicates with the sea, but its water is constantly fresh.^f Its navigation is easy, even for vessels of a large size. The tide is more strongly felt in it than on the adjacent coasts. The lake of Valencia, which was called by the Indians *Tucari-goa*, presents a far more attractive scene. Adorned with a luxuriant vegetation, its banks enjoy an agreeable temperature. Thirteen leagues and a half long, and four in breadth, it receives the water of about twenty rivers, and yet has no outlet itself, being separated from the sea by six leagues of country covered with rugged mountains. The

troverted limits of Texas and the Banda Oriental, originate in the bad faith of Old Spain, and the encroachments of Portugal, two old governments. The boundaries of the liberated provinces stand the same as before the revolution.—EDIT.

^e 50 leagues.—M.B.—*Ed. Encyc.*; 200 miles long and 70 broad.—Morse.—P.

^f It acquires a brackish taste when the wind blows strongly from the sea.—*Ed. Encyc.*—P.

provinces of Caraccas are very rich in rivers, which afford great facility for irrigation. Those that meander in the chain of mountains, empty themselves into the sea, and run from south to north, while those that take their rise on the southern slope of the mountains traverse the whole plain, and fall into the Oronoko. The former, in general, are sufficiently embanked by nature, and have such a declivity as to secure them from often overflowing; or, when these inundations do take place, prevent them from being either long or prejudicial. The latter, however, having shallower beds, and gliding through a more uniform surface of country, intermingle their waters during a great part of the year, at which time they rather resemble a sea, than rivers that have overflowed their banks. The tide, which is very little felt along the whole northern coast, from Cape De la Vela, to Cape Paria, becomes very strong from this latter cape to Dutch Guiana. A great inconvenience, common to all the ports of the provinces of Caraccas, arises from their being continually exposed to the conflict of the tides,^a and to boisterous waves,^b which do not appear to be at all occasioned by the wind, but which are not therefore the less inconvenient, nor the less dangerous.

The northern valleys are the most productive parts of these provinces, because it is there that the heat and moisture are more equally combined than elsewhere. The southern plains, too much exposed to the heat of the sun, produce pasture only, in which they rear cattle, mules, and horses. Cultivation ought to be very flourishing in these provinces, where there are no mines; but its progress is retarded from indolence and want of information. The cacao which they produce, is next to that of Sonocusco in the kingdom of Guatemala, the most esteemed in commerce; it is exported principally to Mexico. The plantations of cacao trees are all of them found to the north of the chain of mountains which coasts the sea. In the interior, indigo, which is of a very good quality, has only been cultivated since 1774. It was at the same epoch that they commenced the culture of cotton. In 1784, it was proposed to rear the coffee plant, for the purpose of trade; but, hitherto, these plantations have been negligently cultivated, and have consequently afforded very moderate crops. Sugar can only yet be classed in the second rank of productions; nevertheless, it is made in considerable quantity. It is, however, almost entirely consumed in the country; for the Spaniards are passionately fond of confectionary, and of every kind of food that admits of sugar. The tobacco is excellent, but the laws interfere with its cultivation. The commerce of Caraccas has undergone the same changes as that of the other Spanish colonies. The smuggling, which was carried on by the Dutch, who were settled in the island of Curacoa, induced the Spanish government to establish, in 1728, the company of Guipuscoa, which had the privilege of sending ships to Caraccas, and engaged to make vessels cruise along the coast, in order to prevent this contraband trade. After undergoing various modifications, this company was finally suppressed in 1778, and liberty was restored to commerce. The exportations of Caraccas are estimated at from 1,041,666*l.*,

^a "Ras de marées," race, tide-way; a current formed by the tides in the open sea, attended with short, broken waves, which cross each other in various directions.—P.

^c "5 to 6 million piastres."

to 1,250,000*l.* sterling,^c including the contraband trade, which is encouraged by the great number of ports.^d

The capital of the government is *Caraccas*, the residence of the governor-general, the audience, intendency, consulate, and archbishop of Venezuela. Before the last earthquake, it contained 42,000 inhabitants. Built in a valley, on very uneven ground, and watered by four small rivers, it possessed, nevertheless, very regular streets, and handsome houses. The temperature of this town does not at all correspond with its latitude; the inhabitants enjoy almost one perpetual spring. It owes this advantage to its elevation, which amounts to 3000 feet^e above the level of the sea. *La Guayra*, at the distance of five leagues, is the port of Caraccas. The sea here is fully as boisterous as the air is hot and unhealthy. We must not omit to take notice of *Porto Cavello*, a town of some trade, situated on the sea-shore, in the midst of marshes, which render the air unhealthy. *Valencia* is a flourishing city, situated in the midst of a fertile and salubrious plain, half a league from the lake of the same name. *Coro*, the former capital, is built near the sea, in an arid and sandy plain. *Cumana*, a town of 28,000 inhabitants, and the capital of a separate government, is situated on a dry and sandy shore, where the air is healthy, although burning hot; but the inhabitants are deterred from raising any extensive edifices, in consequence of the frequency of earthquakes. *Neu Barcelona* is a dirty town, in the midst of an uncultivated country; but the soil of which is excellent. We must also notice *Maracaibo*, the seat of a government, built on a sandy soil, on the left bank of the lake of the same name, six leagues from the sea. The air is excessively hot; yet, a residence there is by no means unhealthy. Its inhabitants, in general, are good sailors and soldiers; those who do not pursue a seafaring life, employ themselves in rearing cattle, with which their country is covered. Their country houses are at *Gibraltar*, on the other side of the lake.^f At the upper end of this lake is situated *Merida*, a small town, the inhabitants of which are very active and industrious, and possess the best cultivated and most productive territory of the whole province. *Truxillo* was once a magnificent town, but was ravaged by the Buccaneers. *Varinas* is the chief place of a government, which, in 1787, was detached from that of Maracaibo. The best tobacco met with in commerce is cultivated here.

The island of *Margarita*, containing the town of *Assumption*, and the harbour of *Pampatar*, is dry, but healthy. Instead of pearls, however, from the fishery of which it originally derived its name, its waters now furnish an immense quantity of fish.

Before the late revolution, the population of the government of Caraccas was estimated at nearly a million of individuals, of which 200,000 were Spaniards, 450,000 free people of colour, 60,000 slaves, and 280,000 Indians. A very haughty nobility took its rise among the Spanish population; but this noblesse was itself divided into two parties, one of which boasted of a purer descent than the other. Almost all the Spaniards here are Creoles. The principal part of those Spaniards who quit their native country, impelled by the national passion for mining, pro-

^d Dauxion Lavaysse, Voyage de Vénézuëla, II. p. 461. Humboldt. Nouvelle Espagne, IV. p. 472. The Edinburgh Gazette gives this amount, exclusive of contraband.

^f History of the Buccaneers, I. p. 278. (Fr.)

ceed to Mexico or Peru. They disdain the provinces of Caraccas, for to those who are only anxious to discover gold in the earth, this country has no attraction to offer, but the slow, periodical, and varied productions of a soil which demands both labour and patience. These Creoles esteem no country more highly than their own, and recognise with reluctance their original descent from old Spain. Strangers experience so many difficulties in entering the Spanish colonies, and, when established there, encounter so many disagreeable circumstances, that they are far from numerous. Nevertheless, the promontory of Paria has become the asylum of a small colony of French and Irish, who lead a patriarchal life, under the shade of their cacao trees.^a The people of colour ardently longed for independence; and they have wreaked the most frightful vengeance on the whites. The *Zambos*, or descendants of Indians and negroes, the most barbarous and immoral of all the people of colour, about half a century since, obtained the right of citizenship in the town of *Nirgua*,^b from which, by their incessant troublesomeness, they have successively driven away all the whites.

The armed force consisted of 6558 troops, comprising the artillery and militia. The total amount of taxes came to nearly 250,000 pounds sterling.^c This sum, however, was rarely sufficient to defray the expenses.

We have reserved for this place the description of that part of *Guiana*, which belongs to the Spaniards, and depends on Caraccas. This tract of country has an extent of more than 400 leagues in length, from the mouths of the Oronoko to the confines of Brazil. Its breadth in many places is fully 150 leagues. The population is very thinly scattered over this immense surface;^d 20,000 of the Indians are under the government of missionaries. This province is divided into Upper and Lower Oronoko. The governor and bishop reside at *San Tome de l'Angostura*, a town built in 1586, on the right bank of the river, at fifty leagues from its mouth; but since that time it has been removed to a distance of ninety leagues from the sea. The streets are straight and paved, and the climate healthy. During the great heats, the inhabitants sleep on the terraces of their houses, without, however, the dew proving injurious either to their health or sight. The old town of *San Tome* is excessively unhealthy.^e The soil in *Guiana* is particularly adapted to the cultivation of tobacco, but it presents only a small number of ill-cultivated plantations, where the proprietors raise a little cotton and sugar, and the provisions of the country. They export a considerable number of cattle. This province, destined to become of great importance by its fertility, as well as its position, will be chiefly indebted for it to the Oronoko. We have already described the course of this river, whose tributary streams, more than 300 in number, are so many canals which will bring to *Guiana* all the riches that the interior may produce. Its communication with the river Amazon, by means of several navigable branches, along which Humboldt himself has proceeded, adds to the advantages which it may procure for *Guiana*, by facilitating its commercial relations with Brazil, and the interior of the new continent. The English, always influenced by an enlight-

ened activity, are aware of the importance of this river, and have established military posts in some of the islands at its mouth, from which they protect the cutting of dye-woods, and keep up a connexion with the *Guaranos*, a peaceable tribe of Indians, who, from their wooded marshes, have set the Spanish power at defiance. Another independent and warlike nation, that of the *Aruacas*,^f occupy the sea coast to the south of the Oronoko: they received arms and spirituous liquors from the former Dutch colonies of *Essequibo* and *Demerara*, which are at present subject to the English. Thus, the sovereignty of the Spaniards, or their late colonists, is any thing but firmly established over the mouth of this important river.

In the upper part of the region of this river, between the third and fourth parallels of north latitude, nature has several times displayed the singular phenomenon, which has been named the *black waters*. The water of the *Atabapo*, the *Temí*, the *Tuamini*, and the *Guainia*, is of a coffee colour. Under the shade of the woods of the palm tree, its colour becomes of a deep black, but in transparent vessels, it becomes of a golden yellow colour. The image of the southern constellations is reflected in it with singular brilliancy. The absence of crocodiles, and of fish, a greater degree of coolness, a smaller number of mosquitoes, and a healthier air, distinguish the region of the black rivers. They, probably, derive their colour from a solution of carburet of hydrogen, resulting from the multitudes of plants that cover the soil through which they flow.^g

Spanish *Guiana* comprehends a part of those arid deserts, known under the name of the *Llanos*,^h of which the remainder belong to the province of *San Juan de los Llanos*, and form a part of *New Granada*. It is impossible to separate from it the description of them, for which we are almost exclusively indebted to the writings of Humboldt.

After quitting the humid banks of the Oronoko, and the valleys of Caraccas, places where nature has been prodigal of organic life; the traveller, struck with astonishment, enters at once upon a desert completely destitute of vegetation; not a hill, not a rock rises in the midst of this immense waste. Over an extent of more than two thousand square leagues, the burning soil nowhere varies more than a few inches in its level. The sand, like a vast sea, presents curious phenomena of refraction and mirage. Travellers are directed in their journeys by the course of the stars, or by some scattered trunks of the *Mauritia* palmⁱ and the *Embothrium*, which are here described at great distances. The earth only here and there exposes horizontal shattered strata, which often cover a space of two hundred square miles, and are sensibly more elevated than the surrounding surface. Twice every year, the appearance of these plains becomes totally changed. At one time, they are as bare as the sands of *Lybia*; at another, they are covered with a verdant turf, like the elevated *Steppes* of middle Asia. On the arrival of the first colonists, they were found almost uninhabited. To facilitate communication between the coast and *Guiana*, some establishments have been formed on the banks of the rivers; and, in the still more remote regions of this immense country, they

have begun to rear cattle, which have multiplied to an amazing extent, notwithstanding the numerous dangers to which they are exposed during the dry season, as well as that of the rains, which is followed by inundations. To the south, the plain is surrounded by a savage and frightful solitude; forests of impenetrable thickness cover the humid country, situated between the Oronoko and the Amazon. Immense masses of granite contract the beds of the rivers. The mountains and forests incessantly resound with the deafening noise of cataracts, the roaring of beasts of prey, and the hollow howling of the bearded monkey,^a which prognosticates rain. The alligator, stretching himself on a sand-bank, and the boa, concealing in the mud his enormous coils, anxiously await their prey, or repose themselves after carnage.

In the forests, and the plains, live nations of different races, and of various degrees of civilization. Some of them, separated from each other by their languages, which have a striking dissimilarity, are a wandering people, completely strangers to agriculture, who live on ants, gum, and earth; and are, in short, the very outcasts of the human species. Of this description, are the *Ottomacs*, and the *Yaruras*. The earth which is eaten by the *Ottomacs* is fat and unctuous, a genuine potter's clay,^b of a greyish yellow tint, owing to the presence of a little oxyd of iron; they select it with a great deal of care, and procure it from particular beds on the banks of the Oronoko and the Meta. They distinguish by the taste one species of earth from another; for it is not every kind of clay that proves equally agreeable to their palate. They knead this earth into balls of from four to six inches in diameter, and roast them before a slow fire, until their surface begins to turn red. When they are desirous of eating one of these balls they wet it again. This savage and ferocious people live on fish, lizards, and fern roots, when they are to be procured; but they are so particularly fond of clay, that they every day eat a little after their food, during the very season when they have other aliments at their disposal.^c The missionaries, who, among the tribes to the west of the Oronoko, have converted the *Betoys* and the *Maypures*, have observed in their language, as well as in that of the *Yaruras*, a regular and even very artificial syntax. The *Achaguas* speak a dialect of the *Maypure*.^d To the east, the mission of Esmeralda is the most remote station. The *Guaiacas*, a very white, very diminutive, almost pigmy, but exceedingly warlike race of people, inhabit the country to the east of Passimoni. The *Guajaribes*, a deep copper coloured, and extremely ferocious tribe, even supposed to be cannibals, prevent travellers from penetrating to the sources of the Oronoko. Mosquitoes, and a thousand other stinging and venomous insects, swarm amidst these lonely forests. The rivers are filled with alligators, and with the little fish, called *caribes*, the ferocity of which is equally to be dreaded. Other tribes in the eastern part of the country, such as the *Muquiritans* and *Makos*, have fixed habitations, and live on the fruits which they cultivate; they possess intelligence, and more sociable manners. The prevailing nation along the coast, from Surinam to Cape de la Vela, was formerly that of the Carib-

beans, or Caribs, now almost exterminated by the Europeans. It is impossible to know whether this race originally came from the Antilles, or extended itself thither. Of all the Indian nations, the Caribbeans are most distinguished by their activity and courage; they inhabit villages governed by an elective chief, whom the Europeans denominate captain. When they proceed to battle, they assemble at the sound of the conch, or sea shell. Next to the Patagonians, the Caribbeans are, perhaps, the most robust nation with which we are acquainted; according to the older travellers, they are said to be *Cannibals*, or *Anthropophagi*. At least, it appears certain that they eat their enemies, devouring their flesh with the voraciousness of vultures. The Caribbean language, one of the most sonorous, and one of the softest in the world, contains nearly thirty dialects; it even appears to be poetical, if we may be allowed to judge from the names of some of the tribes. One of them is called the *Daughter of the Palm-tree*; another, the *Sister of the Bear*.^e The languages spoken by the tribes of the interior, sound much harsher to the ear. With the *Salivas*, the pronunciation is completely nasal; and with the *S'tufas*, entirely guttural; while the *Betoys* always sound the dental letter; and the *Quaivas*, and the *Kirikoas*, as well as the *Ottomacs*, and the *Guaranes*, emit, with incredible volubility, such peculiar sounds, that it is almost impossible to imitate them. The language of the *Achaguas*, is the only one of the interior that is possessed of any harmony.^f Vast tracts of country between the Casiquiari and the Atabapo, are inhabited only by gregarious monkeys, and by tapirs.

Figures engraved on rocks, prove, nevertheless, that this solitude was once inhabited by a people, who had arrived at a certain degree of civilization. Between the second and fourth parallels, in a wooded plain, surrounded by the Oronoko, the Atabapo, the Rio Negro, and the Casiquiari, rocks of sienite and granite are seen covered with colossal symbolical figures, representing alligators, tigers, domestic utensils, and images of the sun and moon. At the present day, this remote corner of the globe is uninhabited, over a space of more than five hundred square miles. The neighbouring tribes are composed of savages, who are sunk to the very lowest degree in the scale of civilization, lead a wandering life, and are far from being capable of tracing the rudest hieroglyphic on these rocks. Similar monuments are met with near Caicara, and Urnana. Perhaps, some day or other, all this may be traced to the Muisca Indians, of whom we shall immediately speak, when describing the *new kingdom of Granada*.

The subdivisions of this kingdom are imperfectly known. The provinces of *Panama* and of *Darien*, although bearing the title of the kingdom of Terra Firma, are dependent on the viceroy of New Granada. The kingdom of Quito, containing the provinces of *Quito*, or *Tacames*,^g *Macas*, *Quizos*, *Jaen de Bracamoros*, and *Guayaquil*, equally retains its title, although it is subject to the new kingdom of Granada. The latter, properly so called, comprehends the following provinces: *Santa Fé de Bogota*, and *Antioquia*, in the centre; *Santa Marta*, and *Carthagena*, to the north, on the Caribbean Sea; *Son*

Juan de los Llanos, to the east; *Popayan*, to the south; *Barbacoas*, and *Choco*, with its dependencies,^a *Beriquete*, *Novita*, and *Raposo*, to the west, towards the Pacific Ocean.

New Granada comprehends a remarkable diversity of climate; temperate, even cold and frosty, but very healthy, on the elevated table lands; the air is burning, suffocating, and pestilential, on the sea-shore, and in some of the deep valleys of the interior. At Carthagena and Guayaquil, the yellow fever is endemic.^b The town of Honda, although situated at the height of 900 feet^c above the level of the sea, experiences, in consequence of the reflection from the rocks, so intense a degree of heat, that the people dare not place their hand upon stones exposed to it; and the water of the river Magdalena acquires the temperature of a warm bath. The rains fall without intermission during winter, which is determined, by the position of the place, to the north or south of the equator; but some spots enjoy a perpetual spring. The crest of the Andes is often enveloped in thick fogs; and the bay of Choco is the scene of continual storms. The two rivers Magdalena and Cauca, both of which run directly from south to north, have their rise and termination in New Granada; each of them flows at the bottom of one of the deep valleys of the Andes, and they form a junction under the 9th degree of north latitude. The course of the Cauca is obstructed by rocks and rapids; but the Indians are able to pass them in their canoes. The Magdalena is navigable as far as Honda; from which you proceed to Santa Fé, by terrific roads, through forests of oak trees, Melastomas and Cinchonas. The unvarying nature of the temperature in each zone, the want of an agreeable succession of seasons, perhaps also the awful volcanic catastrophes to which the high country is frequently exposed, have there diminished the number of vegetable species. At Quito and at Santa Fé, vegetation is less varied than in other regions equally elevated above the ocean. In the Andes of Quindiu, and in the temperate forests of Loxa, we find the cypress, the fir, and the juniper; the mountains raise their snowy pyramids in the midst of the styrax, the passion-flower tree, the bambusa, and the wax palm. The cacao of Guayaquil is in great estimation: it has even been attempted, in the environs of that town, to introduce plantations of coffee, which have succeeded extremely well. The cotton and tobacco are excellent. A great deal of sugar is likewise produced; it is surprising, however, that the greatest quantity is obtained, not in the plains along the banks of the river Magdalena, but on the slope of the Cordilleras, in a valley, on the road from Santa Fé to Honda, which, according to the barometrical measurements of Humboldt, is elevated from 3600 to 6300 feet^d above the level of the sea. The inhabitants make use of the expressed juice of the fruit of the uvilla (*Cestrum tinctorium*) instead of ink; and there is a royal order, which enjoins the viceroys to make use of this blue juice of the uvilla in their official documents, because it is more indestructible than the best ink of Europe.

The mineral productions are rich and varied. In the

valley of Bogota beds of coal are seen at the elevated height of 7680 feet^e above the level of the ocean. It is very remarkable, that platinum is not met with in the valley of Cauca, or to the east of the western branch of the Andes, but only in Choco, and at Barbacoas, to the west of the mountains of sandstone, which rise on the west bank of the Cauca.

The kingdom of New Granada annually produces twenty-two thousand marks of gold, and an inconsiderable quantity of silver. In the mints of Santa Fé and Popayan, about two million one hundred thousand piastres of gold are coined, or eighteen thousand three hundred marks, equivalent to 436,666*l.* sterling. The exportation of this metal in ingots and articles of jewellery, amounts to four hundred thousand piastres, or 104,166*l.* sterling.

All the gold furnished by New Granada is the product of the washings of alluvial earth.^f They are also acquainted with veins of gold in the mountains of Guamoer^g and Antioquia; but the working of them is almost entirely neglected. The richest deposits of alluvial gold are to the west of the central Cordillera, in the provinces of Antioquia, and Choco, in the valley of the Rio Cauca, and on the shores of the great ocean, in the district of Barbacoas.

The province of Antioquia, which can be penetrated only on foot, or by being carried on men's backs, contains veins of gold, which are not worked, merely from want of hands. The largest piece of gold that has been found at Choco weighed twenty-five pounds. All the gold is collected by negro slaves. Choco alone would be able to produce more than twenty thousand marks of washed gold, if, in attempting to improve the salubrity of this region, one of the most fertile of the new continent, the government were to establish an agricultural population there. The country richest in gold is, at the same time, scourged with continual famine. Inhabited by unhappy African slaves, or by Indians who groan under the despotism of corregidores, Choco has remained precisely what it is at present, for the last three hundred years, an impenetrable forest, without a single trace of cultivation, pasturage, or roads. The price of provisions is so exorbitantly high there, that a barrel of flour from the United States is worth from sixty-four to ninety piastres, or from 1*l.* 6*s.* to 1*l.* 15*s.* The maintenance of a muleteer costs a piastre, (4*s.* 2*d.*)^h or a piastre and a half a day. The price of a quintal of iron amounts, in time of peace, to forty piastres. This high price ought not to be attributed to the accumulation of the representative signs, which is very small; but to the enormous difficulty of conveyance, and to that unfortunate condition of things, in which the entire population consumes without producing.

The kingdom of New Granada contains extremely rich veins of silver. Those of Marquetones would surpass Potosi, but they are not worked.ⁱ Copper and lead they disdain to mention. The river of emeralds^k flows from the Andes to the north of Quito. It is at Muzo, in the valley of Tunca,^l near Santa Fé de Bogota, that the principal modern mines, of what are called the emeralds of Peru, are situated, which are deservedly preferred to all others, since those of Egypt have been neglected. These eme-

rals are sometimes met with in sterile veins, which traverse compound rocks, or clay slate, and sometimes in accidental cavities which occur in the masses of some granites. Occasionally they are grouped with crystals of quartz, felspar, and mica; many of them have their surface covered with crystals of sulphuret of iron, and others are found enveloped in carbonate or sulphate of lime.^a Those that are found in the Indian sepulchres are shaped into circles, cylinders, cones, and other figures, and have been pierced with great precision; but we are unacquainted with the process which must have been employed for this purpose. The gold mines of Antioquia and Guamoco contain small diamonds.^b Sulphuret of mercury, or cinnabar, is also found in the province of Antioquia, to the east of the Rio Cauca, in the mountain of Quindiu, at the passage of the central Cordillera; and, lastly, at Cuenca, in the kingdom of Quito. This mercury is found in a formation of quartzose sandstone, which is 720 toises (4320 feet) in thickness, and contains fossil wood and asphaltum.

We now proceed to the more remarkable places of this kingdom. Santa Fé de Bogota, the residence of the viceroy and an archbishop, and the seat of an Audiencia and a University, contains magnificent churches, and houses, five superb bridges, and more than thirty thousand inhabitants.^c The air is constantly temperate. The wheat of Europe, and the sesame of Asia, produce abundant crops, and at all seasons. The plateau on which the town of Santa Fé de Bogota is situated, bears a resemblance, in several respects, to that which incloses the Mexican lakes. Both the one and the other are more elevated than the convent of Saint Bernard; the former being 8190, the latter 7008 feet^d above the level of the sea. The valley of Mexico, surrounded with a circular wall of porphyritic-mountains, is still covered with water in its centre. The plateau of Bogota is equally encircled by lofty mountains; while the perfect level of its surface, its geological constitution, the form of the rocks of Suba and Facatativa, which rise like little islands in the midst of the savannas, all appear to indicate the existence of an ancient lake. The river Funzha, commonly called *Rio de Bogota*, after uniting together the waters of the valley, rushes headlong through a narrow opening into a crevice, which descends towards the basin of the river Magdalena. The Indians attribute to Bochica, the founder of the empire of Bogota, or Condinamarca, this opening in the rocks, and the creation of the cataract of *Tequendama*. Contemplating these rocks, which appear to have been hewn by the hand of man,—this narrow gulf, into which a river precipitates itself, after it has collected all the waters of the valley of Bogota—the rainbows, that change their appearance every instant, and glitter with the most brilliant colours—the immense column of vapour, which, like a thick cloud, rises to such a height, as to be distinguished at the distance of five leagues in the environs of the town of Santa Fé—it is not at all astonishing that a superstitious people should have ascribed to them a miraculous origin. There scarcely exists in the world another cascade which, to so considerable a height, adds so great a body of water; to within a short distance of the *Salto*, the Rio de Bogota preserves

a breadth of two hundred and seventy feet. The river becomes a great deal narrower near the cascade itself, where the crevice, which appears to have been formed by an earthquake, has an opening of only thirty or forty feet. During the driest seasons, the volume of water, which at two bounds rushes down a depth of five hundred and thirty feet,^e still presents a profile of 756 square feet.^f The enormous mass of vapour which every day arises from the cascade, and is again precipitated by the contact of the cold air, greatly contributes to the exceeding fertility of this part of the plateau of Bogota. At a short distance from Canoas, on the height of Chipa, a magnificent prospect is enjoyed, which astonishes the traveller by the striking contrasts it presents. After just leaving behind him cultivated fields, producing wheat and barley, he now finds himself surrounded by oaks, alder-trees, and plants which remind him of the vegetation of Europe, intermingled with the azalea, *Alstonia theiformis*, begonia, and yellow cinchona,^g when, all at once, he discovers from a terrace, as it were, and at his very feet, a luxuriant country, waving with the palm-tree, the banana, and the sugarcane. As the fissure down which the Rio de Bogota rushes, communicates with the plains of the hot region, (*tierra caliente*,) some of the palms are seen growing up to the foot of the cataract. This peculiar circumstance has led the inhabitants of Santa Fé to say, that the cataract of *Tequendama* is so high, that the water falls, at one leap, from the cold (*tierra fria*) into the hot country. It is quite manifest, that the difference of height of eighty-seven toises, or 522 feet, is not sufficiently considerable to influence, in a sensible manner, the temperature of the air. It is the perpendicular section of the rock that separates the two vegetations in so definite a manner.

There is still another natural phenomenon which deserves to be noticed. The valley of Icononzo or Pandi, is bordered with rocks of so extraordinary a figure, that they appear to owe their peculiar shape to human labour. Their bare and arid summits form the most picturesque contrast with the tufts of trees and herbaceous plants that cover the sides of the crevice. The little torrent that has opened itself a passage across the valley of Icononzo, bears the name of the *Rio de la Suma Paz*. This torrent, flowing in an almost inaccessible bed, could not have been crossed without great difficulty, if nature herself had not formed two bridges of rock, an object well worthy of fixing our attention. The deep crevice through which the torrent of La Suma Paz precipitates itself, occupies the centre of the valley. Near the bridge, it preserves, for a distance of more than 12,000 feet,^h a direction from east to west. The river forms two beautiful cascades at the point where it enters the crevice, and at the point where it issues from it. It is very probable that this crevice has been formed by an earthquake. The surrounding mountains are composed of sandstone, with an argillaceous cement. This formation, which reposes on the primitive schist of Villeta, extends from the rock-salt mountain of Zipaquirá to the basin of the river Magdalena. In the valley of Icononzo the sandstone is composed of two distinct rocks; one, a very compact and quartzose sandstone, cou-

^h "2000 toises."

taining little cement, and presenting little or no fissure of stratification, reposes on a very fine-grained schistose sandstone, which is divided into an infinite number of very thin, and almost horizontal layers. Humboldt^a imagines that the compact and quartzose mass resisted the force which rent these mountains, at the period when this crevice was formed; and that it is an uninterrupted continuation of this stratum, which serves as a bridge for crossing from one part of the valley to the other. This natural arch is forty-seven English feet in length, and forty-one feet three inches broad.^b In the centre it is six feet six inches^c thick. According to the experiments of Humboldt, the upper bridge is 317 feet^d above the level of the torrent below. Ten fathoms (*toises*) below this first natural bridge, there is another, to which one is conducted by a narrow footpath, that descends on the side of the crevice. Three enormous masses of rock have fallen in such a manner as mutually to support each other. The middle one forms the key of the vault, an accident which might have suggested to the native Indians the first idea of the arch in masonry, a contrivance alike unknown to the nations of the New World, and to the ancient inhabitants of Egypt.

In the middle of the second bridge of Icononzo, there is a hole of 300 square feet in size, through which one can see the bottom of the abyss; and it was here that our traveller made experiments on the fall of bodies, in order to ascertain its depth.^e The torrent appears to flow within a gloomy cavern. The melancholy noise that floats on the ear, is owing to immense flocks of nocturnal birds that inhabit the crevice. The Indians affirm that these birds are as large as a hen, have eyes like the owl, and a curved beak. It is impossible, however, to procure any of them, on account of the depth of the valley. The elevation of the natural bridge of Icononzo is 2748 feet^f above the level of the sea.

The kingdom of *Terra Firma* is now become a rural solitude. The town of Porto Bello on the north sea, and that of Panama on the Pacific Ocean, were once in a flourishing condition, from their trade in the precious metals, which passed from Peru by the isthmus of Panama, to be transported to Europe. At present, Buenos Ayres is the entrepot. The isthmus of Panama, as well as the province of Darien, produces cacao, tobacco, and cotton; but the air, at once humid and hot, renders these places almost uninhabitable. The country is hilly; but there are also fertile plains. Vegetation every where displays a surprising degree of luxuriance. The rivers are numerous, and the waters of some of them bring down gold. At its narrowest part, the isthmus of Panama is only eight leagues in breadth. The rocky nature of the soil, however, opposes obstacles, probably of an insurmountable nature, to the opening of a navigable canal for large vessels.

During the last few years *Carthagena* has been enlarged and embellished; and it now boasts of an episcopal see, a university, and a safe and deep harbour, defended by several forts;^g but the unhealthiness of its environs is its best defence against an enemy. Its population amounts to

about 25,000 inhabitants. It is the capital of a province of the same name, a hot and humid country, covered with mountains and woods, but very fertile in every species of produce.

In order to avoid the excessive heat and the diseases that prevail during summer at Carthagena, those Europeans who are not habituated to the climate, take refuge in the interior of the country, at the village of *Turbaco*, built on an eminence, at the entrance of a majestic forest, which extends as far as the river Magdalena. The houses are chiefly constructed of bamboo, and covered with palm leaves. Limpid springs issue from a calcareous rock, which contains numerous remains of coral petrifications; and a refreshing shade is afforded by the shining foliage of the *Anacardium Caracoli*,^h a tree of colossal size, to which the natives attribute the property of attracting, from a great distance, the vapours that float in the atmosphere. The surface at Turbaco being elevated more than 900 feetⁱ above the level of the sea, they enjoy a delicious coolness, especially during the night. A very curious phenomenon is observed in its neighbourhood. The *volcancitos* are situated at the distance of 18,000 feet^k to the east of the village of Turbaco, in a thick forest, which abounds with the *Toluifera balsamum*; the *gustavia* with flowers of the *Nymphaea*;^l and with the *Cavanillesia mucundo*,^m the numerous and transparent fruits of which resemble lanterns suspended from the extremity of the branches. The land gradually rises to a height of 120 or 150 feetⁿ above the village of Turbaco; but the soil being every where covered with vegetation, prevents us from distinguishing the nature of the rocks that rest upon the above-mentioned calcareous mass, impregnated with sea-shells. In the middle of an extensive plain, enclosed on all sides by the *Bromelia Karatas*, eighteen or twenty small cones are observed, the height of which is not more than from twenty to twenty-five feet. These cones are formed of a blackish-grey clay, and at the top of each is found an opening filled with water. On approaching these little craters, is heard, at intervals, a hollow and pretty loud noise, which precedes, by from fifteen to eighteen seconds, the disengagement of a great quantity of air. The force with which this air rises above the surface of the water, induces us to suppose, that, in the interior of the earth, it experiences a high degree of pressure. Humboldt generally counted five explosions in two minutes. Very frequently this phenomenon is accompanied with an ejection of mud. It is affirmed that the cones do not undergo any perceptible change of form during the space of a great number of years; but the force with which the gas ascends, and the frequency of the explosions, appear to vary according to the seasons. The analyses of Humboldt have proved that the air thus disengaged, does not contain a thousandth part of oxygen.^o It is azotic gas, of a purer quality than what we commonly prepare in our laboratories.

St. Martha, besides the advantage of a healthy situation, also boasts of a secure, spacious, and well-defended harbour. The province of St. Martha is extremely fertile;

it contains mines of gold and silver, abundance of salt, and manufactories of cotton and earthen ware. *Rio de la Hacha*, situated on the sea shore, and in a fertile district, was formerly enriched by a pearl fishery.

To the south east of Santa Fé de Bogota, and in the interior of the country, we find the province of San Juan de los Llanos, the burning and sterile plains of which we have already described. But towards the south there are provinces more happily situated, and some considerable towns. *Popayan*, containing 20,000 individuals, the greater part of whom are Mulattoes, once flourished by means of its commerce, as an entrepot for Quito and Carthagena. It is built in a picturesque situation on the river Cauca, at the foot of the volcanoes of Suroce and Sotara, which are covered with snow. *Pasto* is a small town, situated at the base of a terrible volcano, and surrounded by thick forests, among marshes, in which mules sink up to the breast. There is no method of reaching this place except through deep and narrow ravines, that resemble the galleries of a mine. The whole province of *Pasto* is an elevated plateau chilled by an atmospheric temperature, almost below the point at which vegetation can exist, and surrounded by volcanoes and solfaterras, which continually disengage volumes of smoke. The wretched inhabitants of these frightful deserts possess no other kind of food than potatoes. When, unhappily, these fail them, they proceed to the mountains to eat the trunk of a small tree called the *Achupalla*. This same tree, however, being the food of the bear of the Andes, that animal frequently disputes with them the only nourishment which these elevated regions can afford.

The province of *Choco* would be richer in the fertility of its hills, and the excellent quality of its cacao, than in its mines, if, unfortunately, all human industry were not entirely interdicted by its cloudy and burning climate. M. Marmontel has painted this coast in colours that are as just as they are lively: "An atmosphere, loaded with thick clouds, where the winds howl and the thunder roars, and from which tempestuous rains incessantly descend; mountains covered with dark forests, the wreck of which covers the ground, while their branches, thickly interwoven, are impenetrable to the light of day; marshy valleys, through which impetuous torrents incessantly roll; shores bristling with rocks, against which the waves, elevated by the tempests, dash themselves with hollow groans; the noise of the winds in the forests resembling the howling of wolves, and the yelling of tigers; enormous snakes, that crawl under the humid grass of the marshes, and, with their vast coils, encircle the trunks of trees; a multitude of insects, engendered by the stagnant air, whose remorseless eagerness is bent but upon one object, as their prey." But, the author of the *Incas* is wrong in applying the whole of this description of the coast of *Choco* to the island of *Gorgona*, where Pizarro came to seek refuge with the twelve companions who had faithfully attached themselves to his fortunes. *Gorgona*, in the bay of *Choco*, as well as the *Archipelago of the Pearl Islands*^a in the bay of Panama, are more inhabitable than the neighbouring continent. In the interior of the province of *Choco*, the ravine of *Raspadura* unites the neighbouring sources of the *Rio Noanama*, likewise called the *Rio San Juan*, with

the little river *Guito*. This latter river, uniting with two others, forms the *Rio Atrato*, which empties itself into the sea of the Antilles, while the *Rio San Juan* falls into the great ocean. A very active monk, curate of the village of *Novita*, made his parishioners dig, in the ravine of *Raspadura*, a little canal, which is navigable during the heavy rains, and by means of it canoes, laden with cacao, have passed from one sea to the other. This little canal, which has existed since the year 1778, unites together, on the shores of the two oceans, two points that are seventy-five leagues distant from one another.

Let us again ascend the Andes, where we shall breathe a milder and more salubrious air; here is situated the celebrated city of *Quito*, the ancient capital of the second Peruvian monarchy, whose inhabitants excel in almost all the arts and trades. They are especially famed for their manufacture of cloths and cottons, which they dye blue, and furnish to the whole of Peru. The commerce of this town is likewise very active; but the streets are too uneven to admit of the use of carriages. It is the seat of a Supreme Tribunal, and of a Bishop. Placed at an elevation of 1480 toises, or 3107 English yards, above the level of the ocean, this town no longer enjoys that perpetual spring which its local situation appeared to insure. The atmosphere has become lowering and cloudy, and the cold rather severe, since the fourth day of February, 1797, the epoch at which a horrible earthquake overwhelmed the entire province of *Quito*, and destroyed, in a single instant, 40,000 people. Such has been the change of temperature, that the thermometer is generally at 40° F. and seldom rises as high as 61° or 63° F.; while Bouguer found it constantly at 59° or 61° F.^b Since that time, earthquakes have been almost continual. Notwithstanding the horrors and the dangers with which nature has thus surrounded them, the population of *Quito*, amounting to 50,000 individuals, breathes nothing but gaiety and luxury; and no where, perhaps, does there reign a more decided, or a more general taste for pleasure. The inhabitants of this town are lively and amiable.

Guayaquil, inhabited by 18,000 persons, is a sea port, and has a commodious dock yard, supplied with timber from the forests in its immediate neighbourhood. It carries on a considerable trade of exchange between the ports of Mexico and those of Peru and Chili. The vegetation in the environs, says Humboldt, is majestic beyond all description. The palms, the *Scitamineæ*, the *Plumeria*, and the *Tabernamontana*, abound in every direction. Don Alcedo affirms, that, in the province of *Guayaquil*, a strong and solid kind of wood is met with, which the inhabitants prefer for the construction of small vessels, especially for the keel and ribs, because it is incorruptible, and resists the attacks of worms better than any other kind. It is very easily worked, of a deep colour, and is called *Guachapeli*, and *Guarrango*.

The provinces of *Quixos*, and of *Macas*, owe to their position on the eastern slope of the Andes, the peculiarities of their temperature. Although they are only two degrees distant, to the south of the equator, winter commences there in April, and lasts till September, the period of spring on the plateau. The climate is hot and moist. Their principal production is tobacco.

^a Archipelago de las Perlas.

^b The height of the thermometer in the original is + 4°, + 16° or 17° and + 15° or 16°. If Reaumur's, it will give 41° F., 68° or 70½° F., and

65½° or 68° F. If the centigrade, 39.2° F., 60.8° or 62.6° F., and 59° or 60.8° F.—P.

The vast province of *Maynas* extends along the river Amazon. It contains but a very few Spanish settlements; the principal one is *San Joaquin de Omaguas*. The *Maynas* and the *Omaguas* are the principal indigenous nations; a small number of them have fixed themselves near the missions; but the greater part wander in the forests, living by the chase and by fishing. The country produces white and black wax, and cacao.

We should not do justice to our description of the kingdom of Quito, if we were to pass over in silence the terrific volcanoes which have so often overwhelmed the country, and swallowed up whole cities at a time. The majestic *Chimborazo* is probably nothing but an extinguished volcano. The snow which for centuries has crowned its colossal peak, will probably, one day or other, be melted by the remorseless fires pent up within its vast and fathomless caverns, resuming their destructive activity.

Pichincha is one of the greatest volcanoes on the surface of the globe. Its crater, hollowed out in basaltic porphyries, was compared by La Condamine to the chaos of the poets. This immense mouth was at that time filled with snow, but, afterwards, Humboldt found it burning. From the circumference of the crater rise, as if shooting up from the abyss below, three rocky peaks, which are not covered with snow, because it is constantly melted by the vapours that exhale from the volcano. In order the better to examine the bottom of the crater, we lay down flat on our breasts; and I do not believe that the imagination could figure to itself any thing more melancholy, gloomy, and terrific, than what we now behold. The mouth of the volcano forms a circular hole of nearly a league in circumference, the sides of which, a perpendicular precipice, are covered above with snow to their very edge. The interior was of a deep black; but the gulf is so immense that we could distinguish the tops of several mountains that are situated within it. Their summits appeared to be two or three hundred fathoms (*toises*) below us—judge then where must be their base. I myself have no doubt that the bottom of the crater is on a level with the city of Quito.”

Cotopaxi is the most elevated of those volcanoes of the Andes, from which, at recent periods, there have been eruptions. Its absolute height is 12,392 English feet;^a it would consequently exceed by more than 2,550 feet^b the height of mount Vesuvius, even supposing that it were piled on the summit of the Peak of Teneriffe. *Cotopaxi* is likewise the most formidable of all the volcanoes of the kingdom of Quito; and its eruptions have been the most frequent and the most destructive. The cinders and fragments of rocks that have been ejected by this volcano, cover the neighbouring valleys to an extent of several square leagues. In 1758, the flames of *Cotopaxi* shot up to a height of 2,700 feet^c above the edge of the crater. In 1744, the roaring of this volcano was heard as far as Honda, a town situated on the banks of the river Magdalena, at a distance of two hundred leagues. On the 4th April, 1768, the quantity of ashes vomited up from the mouth of *Cotopaxi* was so great, that in the towns of *Hambato* and *Tacunga*, the sky continued as dark as night until the third hour after mid-day. The eruption which took place in the month of January, 1803, was preceded by a

frightful phenomenon—the sudden melting of the snows that covered the mountain. For more than twenty years neither smoke nor any distinguishable vapour had issued from the crater, and yet, in a single night, the subterranean fire had become so active that, at sun-rise, the external walls of the cone, strongly heated, had become naked, and had acquired the black colour which is peculiar to vitrified scorix. At the port of *Guayaquil*, fifty-two leagues in a straight line from the edge of the crater, Humboldt heard, day and night, the roaring of this volcano, like repeated discharges of artillery.^d

Were it an established fact that the proximity of the ocean contributes to feed volcanic fire, we should be astonished to see that the most active volcanoes of the kingdom of Quito, *Cotopaxi*, *Tunguragua*, and *Sangay*, appertain to the eastern chain of the Andes, and, consequently, to that which is farthest removed from the coast. *Cotopaxi* is more than fifty leagues from the nearest shore.

To our description of the kingdom of Quito, we ought to add that of the *Gallapagos Islands*. This archipelago, situated under the equator, at 220 leagues to the west of the continent of America, contains volcanic peaks in the more eastern islands. The Cactus and the Aloe cover the sides of the rocks. In the western islands a black and deep mould affords nourishment to large trees. Flamingos and turtle doves fill the air, and the beach is covered with enormous turtles. No trace whatever indicates the residence of man. Neither the Malays of the great Ocean, nor any of the tribes of America, have ever landed on these lonely shores. Dampier and Cowley observed springs, and even rivers, in some of these islands, the peculiar Spanish names of which have given place to English appellations, at least in all our modern charts. *Santa Maria de l'Aguada* appears identical with *York Island*. The largest among the twenty-two that are known, are those of *Albemarle* and *Narborough*. Cowley describes the enchanted island, which presents a varied prospect of what appears to be a walled town, and a strong castle in ruins. Several harbours and roadsteads invite Europeans to form establishments there.

There are many Indian tribes in the kingdom of New Granada. Many of them still enjoy their independence, and almost all of them retain their language and particular customs. The *Guairas* or *Guagniros*, occupy part of the provinces of *Maracaibo*, *Rio de la Hacha*, and *St. Martha*, and live on friendly terms with the *Motilonas*, who inhabit the lands watered by the *Muchuchies* and the *St. Faustin*, as far as the valley of *Cucuta*. They infest the passes of the mountains; pillage, conflagration, and murder, mark their incursions into the plains. The *Chilimes*, and another band of the *Guairas*, are freebooters on the banks of the *Magdalena*.^e The *Urabas*, the *Zitaras*, and the *Oromisas*, form three independent states in the province of *Darien*, the first under a native prince called the *Playon*, the two last under a republican government.^f The *Curacunas* dwell on the mountains of *Choco* and *Novita*; they extend their ravages as far as *Panama*, and even attack small vessels in search of plunder.^g The ancient inhabitants of *Quito*, in common with the savage tribes of *Africa*, are said to have spoken many different dialects. The missionaries have specified not less than a hundred

^a “2052 toises.”

^b “More than 400 toises.”

^c “450 toises.”

and seventeen; it appears, however, that the language of the *Quitos* prevailed over the plateau, and that of the *Sciros* along the coast. It is remarkable that the name of the *Sciros* should be the same as that of an ancient European tribe, famous for its migrations and warlike exploits.^a They are said to have conquered the upper districts, and introduced their language into that part of Quito in the year 1000. At the time of the arrival of the Spaniards, the Peruvians were in possession of the country, and their language was generally adopted; but must we therefore conclude, with Hervas, that the *Sciros* spoke a Peruvian dialect? In the year 1600, the *Cofanes*, one of the hundred and seventeen tribes of Quito, are said to have amounted to fifteen thousand souls; they spoke a peculiar language, which was also spoken by the inhabitants of *Anga Marca*, and in which a Jesuit has written an epitome of Christianity.^b Of the fifty-two tribes of Popayan, those of *Guasinca*, *Cocanuca*, and *Paos*, had three distinct languages, which are still partly preserved in the writings of the missionaries. The *Xibaros*, the *Macas*, and the *Quizos*, at one time formidable tribes, occupied the eastern declivities of the Andes, in the kingdom of Quito. Nearer the level of the sea, in the vast district of *Maynas*, are found the remains of unnumbered tribes, whose languages the missionaries have classed in the following order:—1st, Sixteen mother tongues, of which the *Andoa* has nine dialects, the *Campa* seven, and the *Mayna* four; 2dly, Sixteen scattered dialects that have no resemblance to any known mother tongue; 3dly, Twenty-two tribes, several of which are still extant, although their language is extinct; lastly, ten unknown languages. We have not included in this list the extensive tribe of the *Omaguas*; its inhabitants, spread over the whole course of the Marañon or Amazon, speak a dialect of the Guarani language in Brazil, but simpler in its grammatical forms, and more abundant in its vocabulary, from which we may infer that they had arrived at a greater degree of civilization than their kindred tribes. The migrations of this tribe of river navigators have not been clearly ascertained, but it is generally believed that they were originally from Brazil.

A civilized country, surrounded by these savage and wandering nations, is a phenomenon worthy of our particular attention.^c Santa Fé de Bogota rivals Cuzco, the city of the sun, as a centre of religious and civil institutions. We shall therefore proceed to illustrate this interesting problem in the history of society.

In the most remote period of antiquity, before the moon accompanied the earth, according to the mythology of the *Muyscas*, the inhabitants of Condinamarca, on the plateau of Bogota, lived like savages, without agriculture, laws, or religion. An aged person appeared suddenly amongst them, who came from the plains on the east of the Cordillera of Chingaza. His long and thick beard showed that his origin was not the same as that of the natives. He was known by three different names, *Bochica*, *Nemquetheba*, and *Zuhé*. Like Manco-Capac, he taught men to clothe themselves, to build cottages, to cultivate the ground, and to live in society. He brought with him a wife, to whom tradition has also given three names, *Chia*, *Yubecayguaya*, and *Huythaca*. She was remarkable for her beauty, but more so for her wickedness. She opposed all her hus-

band's labours for the happiness of the human race; by her magic she raised the waters of the river *Funzha*, and inundated the whole valley of Bogota. In this deluge, the greater number of the inhabitants were destroyed; a few only escaped to the summits of the neighbouring mountains. The aged stranger, provoked by such crimes, drove *Huythaca* from the earth; she became the moon, and began, at that period, to illuminate our planet during the night. *Bochica*, pitying those that wandered in the mountains, broke the rocks which enclose the valley on the side of *Canoas* and *Tequendama*. The waters of the *Funzha* having by this means subsided, he brought back the people to the vale of Bogota, founded cities, introduced the worship of the sun, and named two chiefs, whom he invested with the religious and civil authority. He then withdrew to *Mount Idacanzas*, in the sacred valley of *Iraca*, near *Tunja*; having lived at this place in the exercise of the most austere devotion for two thousand years, or a hundred *Muysca* cycles, he disappeared at the end of that time in a mysterious manner.

This Indian fable bears an analogy to some opinions contained in the religious traditions of different nations in the old world. The good and evil principles are personified in the aged *Zuhe* and his wife *Huythaca*. The broken rocks, through which a passage is made for the waters, recall to mind what is related of *Yao*, the founder of the Chinese empire. A remote period before the existence of the moon is taken notice of by the *Arcadians*, a people that boasted of their ancient origin. The moon was considered as a malevolent being, that increased the humidity of the earth; but *Bochica*, the offspring of the sun, drained the soil, protected agriculture, and was as much revered, as a benefactor, by the *Muyscas*, as the first *Inca* by the *Peruvians*.

There is a tradition that *Bochica*, observing the chiefs of the different tribes contending for the supremacy, advised them to choose *Huncahua* for their *zaque*, or sovereign, a person distinguished for his justice and great wisdom. The advice of the high priest was willingly obeyed, and *Huncahua* having reigned for two hundred and fifty years, made himself master of all the country from the savannas of *San Juan de los Llanos* to the mountains of *Opon*. The form of government which *Bochica* gave the inhabitants of Bogota, resembled those of *Japan* and *Thibet*. In *Peru*, the *Incas* held in their own hands the ecclesiastical and secular power, and were kings and priests at the same time. At *Condinamarca*, at a period probably anterior to that of *Manco-Capac*, *Bochica* appointed four electors, *Gameza*, *Busbanca*, *Pesca*, and *Toca*, the chiefs of their respective tribes; after his death, these persons and their descendants had the privilege of choosing the high priest of *Iraca*. The pontiffs, or *lamas*, being the successors of *Bochica*, were supposed to inherit his virtues and his sanctity. The people flocked in crowds to *Iraca*, that they might offer gifts to their high priest. Many places in which *Bochica* wrought miracles, were visited with holy ardour. In time of war, pilgrims enjoyed the protection of the princes, through whose territory they passed to repair to the sanctuary, (*chunsua*,) and to prostrate themselves before the *lama* who resided there. The secular chief was denomi-

ral del Nuevo Reyno de Granada, a work compiled from the manuscripts of Quesada.

nated the *zaque* of Tunja, to whom the *zippas* or princes of Bogota paid an annual tribute. Thus the high priest and the *zaque* formed two distinct powers, like the dairi and secular emperor in Japan.

Bochica was not only regarded as the author of a new worship, and as the legislator of the Muyscas, but being the symbol of the sun, he measured the seasons, taught the Muyscas the use of their calendar,^a and marked the order of sacrifices to be offered at the close of the little cycles, at the period of every fifth lunar intercalation. In the dominions of the *zaque*, the day and night (or the *sua* and *za*) were divided into four parts: the *sua mena* lasted from sunrise to noon; the *sua meca*, from noon to sunset; the *zasca*, from sunset to midnight, and the *caqui*, from midnight to sunrise. In the Muysca language, *sua* or *zuhe* signifies the sun as well as a day. From *sua*, which is one of the surnames of Bochica, is derived *sue*, a European or white man, a word that was first applied to the Spaniards, who

landed with Quesada, because the natives believed them to be the children of the sun. The Muyscas computed their time by divisions of three days; hebdomadal periods were unknown in America, as well as in a part of eastern Asia. The year (*zocam*) was calculated by lunations; the civil year consisted of twenty moons, while that of the priests contained thirty-seven; and twenty of these great years formed the Muysca cycle. To express lunar days, lunations, and years, the people made use of a periodical series, the terms of which were denoted by numbers.

The language of Bogota has been almost extinct since the end of the last century; it was extended by the victories of the *zaque* Huncahua, by the warlike exploits of the *Zippas*, and by the influence of the lamas of Iraca, from the plains of the Ariari and the Rio Meta to the north of Sogamozo. This language was called by the natives, the *Chibcha*. Muysca, of which *Mozca* seems to be a corruption, signifies a man or person, but in general the natives applied it exclusively to themselves.

BOOK LXXXVIII.

THE DESCRIPTION OF AMERICA CONTINUED.

Description of Peru, according to its ancient limits.

THE ancient empire of the Incas has been more than once dismembered, and Potosi has been detached from Peru; out Nature, which establishes her divisions independently of royal edicts, forces us to include in this book not only the vice-royalty of Lima, but that portion of the empire of the Incas and of Upper Peru, lately added to the vice-royalty of Buenos Ayres, which extends to the plains of Chaco and the defiles of Tarija. Sierra Vilcanota is the political limit of the two vice-royalties, but such boundaries are of little importance at a time when the armies of Lima and Buenos Ayres are contending for the wrecks of these unfortunate countries.
